## $\mathrm{F} O$ i

$\therefore-\mathrm{F}$ ORDYCE, D.svid, an elegant ara $\begin{gathered}\text { med wri- }\end{gathered}$ ter, was born at Aberdeen in the year 1.1n. H ving received the early part of his education at the gramnar ichool, at the age of 13 he was entered at thic Greek clafs is Marifchal college, Aberdeen; in 1728 he took the degree of A. M. and was afterwards, in I $/ 22$ admitted profelfor of philofophy in the lame college. He was originally defigned for the minitry; to preparc himfelf for which was the whole object of his ambitin, and for a courfe of years the whole parpofe of his his dies. How well he was qualifed to appear in that charracter, apiezre from his " Theodorus, a dialogut con"cruing the art of preaching." Having finithed this work. he went abroad in 1750 on his travels, in order :3 obtain irefh ftores of knowledge: but after a Fuccefsful tour through feveral parts of Europe, he was, on his return home, unfortunately caft way in a form on the coa!t of Holland, in the $\ddagger$ Ift year of his age. Beides the atove work, he wrote Dialogues on Educa:ijn, 8vo, and a Treatife of Moral Philofophy, publithed in the Preceptor. The third ecition of his Theodorus was publifhed in London, in 1751, after his death, by his brother James, the fubject of the following ardicle.

Fordyce, Yamer, a Scotch divine, juitly efteemed I) his piety and mnceruity, as well as for his pulpit Hpluence, was torn at Aberdeen in the year 1720 . He received his clalfical education at the public gramnar ichool, and went aftervards to the Mirnichal colitge, where he went through the ufual corric of itudies ${ }^{1}$ e: ellary for a minitter of the gofpel. Hi, natural aiviWitie were excellent, and he improved to the utmof the $\therefore$ ourable opportunities he enjoyed at the wiveriny, Which mate him be conlidered as well qualitied for a freacher of the golpel at an early peciod of uife. His fort appointment was that of fecond miniler in the inurch of Brechin in the county of Angus, after which he accepted of a call to Alloa near Stirling. The people of the t parifh were prepofiefied in favour of another, and prejudiced agiml Mr Fordyce, which could twt Idil to be a mot unplealiot circumbane; yot by his in:po Tive delivery, and indefatizable attemtion to coury gut of his miniterial duty, he foon changel their prea dice intu eiteem, and their ehear. into admintio*.

## F O K

the thed on the delufive and bloody igirit of popery, Fothure. preacl . extore the !ynod of Perth and Stirling. But Atill greater won ar aftonihment were excited by his inimitable iermurt on the folly, infamy, and mifery of unlawful pleafure, preachud bufe the general atfembly of the church of Scotland in 1760 . It contains fuch mafterly compofition with relpect to defription, fpirit, and elegance, and was delivered with fuch uncommon folemaity, animation, and pathos, that it filed his learned fathers and bretiren with altonilhment, and juitly raifed him to univalled eminence among his cie. rical cotemporaries. Auult this time he was complinomed with the degree of doctor in divinizy by the wri velity of Glafgow, probatly on account of the fame le acquired by this extroordinary fermun.

The friends of Dr Fordyce being mafly in London. he was invited to that metropolis to be the colleague of Dr Lawrence, miniter of a refpectable congregrion i:s Monkweh-itrect, on whofe death, which haprencil as fiv months afier, Dr For yoe became once more fi. mous for his pulpit eloquence, always preaching t', overtlowing audiences. This popularity he jutly deferved, whether with refpect to the elegance of hi, compolitions, or their happy tendency to imprefs the heart with the love of virtue and religion. Yet even Dr Fordyce lived to fee his popularity on the decline ; for fuch as attend a place of worthip from mere motives of curionity nutt have fickle and untable mind, changins their preachers as they do their dref, loving to the where others are, of doing what others do, and of aimiring what others admire, for they have no tute of their own.

His pews were thinned from another caufe, whict was the failure of a younger brodher, an estenlive binker, which ruined many of the do 2 rr's condt int hearers and moit liberal lupnorter. Although the doctor could not be reafonably blamed for the fathere of his brother, yet it is certain that it brought a degrece of ollum on the whole family. Ancther aufe ot the dimabution of his hearers was an whappy diff rence betwent him and Mr Iolier his collague, wid hapgered in the :e:s 175 5, and which cided in a divifion of the congeration, natny re evabie families fullow.

Fordyce. tion of his fuccefor Mr James Lindfay, and highly meriting the attentive perufal of every clersyman. The remainder of his valuable life he fpent chietiy at a retirement in Hampinire in the vicinity of the earl of Bate, with whom he lived in the greatet intimacy, and to whole valuable library he had unlimited accets. He afterwards went to Bath, where he fuffered nuch from an althmatic affection, but bore it with the heroic fortitude of a Chritian, and expired without a grom on the firit of October 1796, in the 76th year of his age.

The doctor's writings difcover much genius and imagination, a correct tafte, extenfive knowledge of the world, and a happy method of engaging the attention; full of ardent piety, and a zeal for the interelts of genuine virtue. His religious fentiments were manly and rational ; in private life he was highly amiable, and defervedly beloved by all who knew him. He was author of Sermons to Young Wonen, in two volumes 12 mo , which have been tranflated into feveral European languages; A Sermon on the Character and Conduct of the Female Sex; Addreffes to Young Men, in two volumes 12 mo ; Addrelles to the Deity; A volume of Poems; A difcourfe on Pain, and Additions to his brother's Temple of Virtue.

FORDyCe, Georse, a writer and lecturer on medicine, was born in the year 1736 , and ftudied at the univerfity of Aberdeen, where he obtained the literary degree of M. A. at the early age of 14 , perhaps not aitogether owing to the fuperior caft of his genius, or the extent of his acquirements, which could not be extraordinary in a boy of his years. He became apprentice to an uncle who practifed furgery at Uppingham in Rutandhire, when he was only $1_{5}$, and afterwards vent to the univerfity of Edinburgh, where his diligetice and progrefs attracted the attention of $\mathrm{D}_{\text {: }}$ Cullen, a: that time profeflor of chemiftry, who very generoufly promoted his improvement. He graduated in 1758 , when oniy 22 years of age; after which he refided one winter at Leyden. The greater part of his patrimony being Ipent on his education, he relolved to try his fortune in London, where he fettled in the year 1759. He commenced with a courle of lectures on chemiftry; and although his encouragement at firlt was by no means flattering, jet he fteadily and diligently perfevered, notwithitarding fuch unfavourable appearances, till his literary merit began gradually to be difcovered and properly appreciated. A number of young men who came to study in London did not think that their medical courfe was complete, without availing themfelves of the benefit of his courfe of lectures.

In the year 1768 , he publithed his Elements of the Praftice of Phylic, which formed the text book of his medical courfe, and were much read as a valuable epitome of medicine. His private practice was very refrectable; and in the year 17 -0 his medical reputation was fo great, that he was cholen phyfician to the holpital of St Thomas, although lie had to contend againtt a gentleman with very powertul intereft; and his merit as a man of fcience made him a member of the Royal Srinty in 1776 . He was chofen in 1787 a fellow of the College of Phyficians; and his chemica! knowledge was of fingular importance to that body for a new edition of their Pharmacopocia. By the influence of his connections, but probably morc fo by his litcrary repu-
tation, he was appointed to furnifh the navy with fourkrout, which we believe he executed with advantage both to himfelf and the public.

His conftitution difcovered fymptoms of premature decay, yet he continued to difcharge his profe homal duties till he fell a victim to an irregular gout, and a water in his cheft, on the $25^{\text {th }}$ of June 1802 , in the 66 th year of his age. If his lectures wanted the charms of an eloquent delivery, he made ample compenfation by the originality of his ideas and his fcientific information, and by a memory which was uncommonly retentive. His works are, Elements of Agriculcure and Vegetation; Of the Practice of Phyfic ; A Treatife on the Digeftion of Food ; and Four Differtations on Fever.

FORE, applied to a hip, denotes ail that part of a Chip's frame and machinery which lies near the ftem.

Fore and aft, is ufed for the whole thip's length, or from end to end.

FORECASTLE of a Slip, that part where the foremalt lands. It is divided from the reft by a bulkhead.

FOREIGN, fomething extraneous, or that comes from abroad. The word is formed from the Latin fores, " doors;" or foris, " out of doors;" or forum, " market," \&ic.

Foreign minifter, foreign prince, foreign goods, \&c. are thofe belonging to other nations. See Minister, \&c.

Foreign to the purpofe, fignifes a thing remote or impertinent.

Foreign, in the Englif Law, is ufed in various fignifications. Thus,

Foreign Attachment, is an attachment of the goods of foreigners found within a city or liberty, for the fatisfaction of fome citizen to whom the foreigner is indebted; or it fignifies an attachment of a foreigner's money in the hands ot another perfon.

Foreign Kingdam, a kingdom under the dominion of a foreign prince.

At the inftance of an ambaffador or conful, any offender againt the laws here may be fent for hither from a foreign kingdom to which he hath fled. And, where a ftranger of Holland, or any foreign country, buys goods at London, for infance, and there gives a note under his hand for payment, and then groes away privately into Holland; in that cafe, the leller may have a certificate from the lord mayor, on the proof of the fale and delivery of fuch goods, whereupon a procefs will be executed on the party in Holland.

Foreign Oppofer, or Appofer, an officer in the exchequer that oppofes or makes a charge on all theriffs, \&c. of their green wax ; that is to lay, fines, iffues, amerciaments, recognizances, \&c.

Foreign Plea, fignifies an objection to the judge of the court, by refufing him as incompetent, becaule the matter in queftion is not within his jurifdiction.

Forign Seamen, ferving two years on board Bri tifh fhips, whether of war, trade, or privateers, during the time of war, fhall be deemed natural-born fubjests.

FOREIGNER, the natural-born fubject to fome foreign prince.

Foreiguess, though made denizens, or naturalized,

 rying the iore ail and fot-top fill yad. It, kopeth is afualiy of the main-mat, and the fore-top-bullantmalt is ; the length of the fore-tes.

Foremist Ma ", are thole on hourd a hing that take i: the top-fails, fling the yard, furl the hiis, bowie, trice. and take theie turn at the helm, \& :

FOREST, in (iography, a huge wood; or, a large extent of $q$ round covered with trees. The word is formed of the Latin forcha, which firtt occurs in the capitulars of Charlemagne, and which itfelf is derived from the German $f_{\mathrm{ra}}^{\mathrm{of}} \mathrm{f}$, lignifying the fame thing. Spelman derives it from the Latin foris refat, by seafon forelts are cut of towns. Others derixe forefla from foris. q. d. Forefta, quod fit tuta fatio ferarum, as being a fafe ilation or abode for wild beafts.

The Caledonian and Hercynian forefs are famous in hiftory, The firlt was a celebrated retreat of the ancient Picts and Scots: The latter anciently occupied the greateft part of Europe; particularly Germany, Poland, Hungary, \&ic. In Cetar's time it extended from the borders of Alsatia and Sritzerland to Tranfylvania; and was computed 60 days joumey long, and 9 broad : fome parts or cantons thereof are ftill remaining.

The ancients adored forcfts, and imagined a great part of tieir gods to refide therein : temples were frequently built in the thickett forefts; the gloom and filence whereof naturally infpire fentiments of devotion, and turn men's thoughts within themfelves.

For the like reafon, the Druids made forefts the place of their refidence, periormed their faerifices, intructed their youth, and gave laws therein.

Forest, in Law, is defined, by Manwood, a certain territory of woody grounds and fruitful paftures, privileged for wild beaffs and fowls of foretl, chafe, and warren, to reft and abide under the protection of the king, for his princely delight; bounded with unremoveable marks and meres, either known by matter of record or prefcription; replenihed with wild bealts of venery or chafe, with great coverts of vert for the faid beails; for prefervation and continuance whereof, the vert and venifon, there are certain particular laws. privileges, and officers.

Foretts are of fuch antiquity in England, that, elcepting the New Forett in Hampflire, crected by William the conqueror, and Hampton Court, erected by Henry VIII. it is faid, that there is no record or hiftory which makes any certain mention of their crection, though they are mentioned by feveral writers and in feveral of our laws and thatutes. Ancient hillorians tell us, " that New foreft was raiied by the deftruction of 22 parith churches, and many villages, chapels, and manors, for the frace of 20 miles together, whim was attended with divers judements on the pollerity of William I. who erected it : for William Rufus was there fhot with an arrow, and before him Richard the brother of Henry 1.; and Henry nephew to Robert, the cldeft fon of the Confuereor, did bang by the hair of the head in the bough of the foreit, like unto Abfalunt." Bhount.

Belides the New feref, there are 68 oher forelts in Englad. 13 chake, and more than 700 parks: the fort priscipal forefsare New forelt on the fea, ShireA:

## F C R [ 4 [ $\quad\left[\begin{array}{ll}1\end{array}\right.$

F.uff. wood foreit on the 'Trent, Dean foreft on the Severn, and Windtor fonelt on the Thames.

A forelt in the hands of a tubject is properly the fame thing with a Chase; beimg fubject to the common law, and not to the furelt laws. But a chafe differs from a forct in that it is not enclofed: and likewilc, that a man may have a chate in mother man's ground as well as his own; being indeed the liberty of keeping beants of chafe, or royal game thicrein, protected even from the owner of the land, with a power of hunting them thereon. Sce Park.

The manner of crecting a forelt is thus: Certain comminitoners are appointed uider the great feal, who view the ground intended for a foreft, and fence it round; this commilfion being returned into chancery, the king cauteth it to be proclaimed throughout the county where the land lieth, that it is a forelt; and prohibits all perfons from hunting there, without his leave. Though the king may ercet a foreft on his own ground and wate, he may not do it on the ground of other perfons without their confent; and agreements with them for that purpole ought to be confirmed by parliament.

A foreft, frictly taken, cannot be in the hands of ary but the king; for no perton but the king has power to grant a commiffion to be juitice in eyre of the forent : yet, if he grants a forent to a fubject, and that on requett made in the chancery, that fubject and his heirs thall have juttices of the foreft, in which cale the fubject has a foreft in law.

A fecond property of a foreft is, the courts thereof. See Forest Courts, infra.

A third property is the officers belonging to it, as the juftices, warden, verderer, forefter, agiftor, vegarder, keeper, baiiiff, beadle, \&c. See the articles Agistor, Bailiff, Forester, \&c.

By the laws of the foreft, the receivers of trefpaffes in hunting, or killing of the deer, if they know them to be the king's property, are principal trefpaffers. Likewife, if a trefpafs be committed in a forelt, and the trefpaffer dies, after his death it may be punifhed in the lifetime of the heir, contrary to common law. Our Normen kings punifhed fuch as killed deer in any of their forells with great feverity; alfo in various manners; as by hanging, lofs of limbs, gelding, and putting out eyes. By magna charta de fore? $a$, it is ordained, that no perfon thall lofe life or member for killing the ki:g's deer in ferefts, but thall be fincd; and if the offender has nothing to pay the fine, he flall be imprifored a year and a day, and then be delivered, if he can give lecurity not to offend for the future, \&c. 9 Hen. IIl. c. 1.

Before this ftatute, it was felony to hunt the king's deer; and by a late att, perfons armed and dilguifed, appearing in any foreit, \&c. if they hunt, kill, or theal any deer, \&c. are guilty of felony. 9 Geo. I. c. 22 .

He who has any licenfe to hunt in a foreft or chafe, \&c. is to take care that he does not exceed his anthority; otherwife he ftall be deemed a trefpaffer from the becinning, and be punibed for that $\mathrm{fact}_{\mathrm{z}}$ as if he had no licenfe. .Sce further, the articles Game, and Game-Latw.

Bealt of the foreft are, the hart, hind, bock, doe, boar, wolf, fox, hare, \&.c. The feafons for hunting
whereof are as follow, viz. that of the hart and buck begins a: the feat of St John Baptill, and ends at Holy-rood day; of the lind and doe, begins at Holyrood, and continues till Candlemas; of the boar, from Chrifimas to Candlemas; of the fox, begins at Chrifmas, and continues till Lady-day; of the hare at Michaclmas, and lafts till Candlemas.

Forest-Courts, courts indtituted for the government of the king's forells in different parts of the kingdors, and for the punifhment of all injuries done to the king's deer or venifon, to the vert or greenfwerd, and to the covert in which fuch deer are lodged. Thefe are the couits of Attachments, of Regard, of Sweinmot E, and of Justice-sfat. 1. The court of attachments, woodmote, or forty-days court, is to be held before the verderers of the torelt once in every forty days; and is inftituted to inquire into all offenders againtl vert and venilon: who may be attached by their bodies, if taken with the mainour (or mainouvre, à mann) that is, in the very act of killing venifon, or ftealing wood, or in the preparing fo to do, or by frefh and immediate purfuit after the act is done; elfe they muft be attached by their goods. And in this forty-days court the forefters or keepers are to bring in their attachments, or prefentments de viridi et venatione; and the verderers are to receive the fame, and to enrol them, and to certify them under their feals to the court of julticefeat or fweinmote: for this court can only inquire of but not convict, offenders. 2. The court of regard, or furvey of dogs, is to be holden every third year for the lawing or expeditation of maftiffs; which is done by cutting off the claws of the fore feet, to prevent them from running after deer. No other dogs but maltiffs are to be thus lawed or expeditated, for none other were permitted to be kept within the precincts of the foreft ; it being fuppofed that the keeping of thefe, and thefe only, was neceffary for the defence of a man's houfe. 3. The court of fweinmote is to be holden before the verderers, as judges, by the Iteward of the fweinmote, thrice in every year; the fweins or freeholders within the foreft compofing the jury. The principal jurifdiction of this court is, firft, to inquire into the oppreftions and grievances committed by the officers of the foreft ; "de fuper-oneratione fore/larorium, et aliorum miniftrorum foreffe; et de corum oppreffonibiu: populo regis illatis:" and, fecondly, to receive and try prefentments certified from the court of attachments againft offences in vert and venifon. And this court may not only inquire, but convict alfo; which conviction thall be certified to the court of juftice-feat under the ferls of the jury, for this court cannot proceed to judgment. But the principal court is, 4 . The court of jultice feat, which is held before the chief.juitice in eyre, or chief itmerant judge, capitalis juficiarius in itinere, or his deputy ; to hear and determine all trefpetfes within the foreft, and all claims of franchifes, liberties, and privileges, and all pleas and caufes whatfocver ther in awing. It may alfo proceed to try prefentments in the inferior courts of the forefts, and to give judgment upon conviction of the fwcinmote. And the chief juttice may thercfore, after prelentment made or indietment found, but not before, ilitie his warr ant to the ofticers of the foreit to apprehend the offenders. It may be beld every third year ; and 40 days notice ought to be giver of its n i:tirg. This court

## F O R $\left[\begin{array}{lll}5 & F & O \\ \hline\end{array}\right.$

Fore a. may fine and imprifon for offences within the forest, it
 lies from hence to the court of king's-bencis, to ueclify and redrefs any mal-adminittations of intice; or the chief jutice in evre may adjoum any watas of hw into the court of hing's-vench.

Forest-La:ers, are pecular latw, diftern from the common law of England. Before the mainet ot Chara de Forefla, in the time of King John atd his fon Henry III, confirmed in parliament ty o ilary IIl. offences committed therein were puminel at the pleafure of the king in the fevertt momer. By this charter, many forelts were difafforelted ard itripied of their eppreflive privileges, and regulations were made for the government of thote that remained; particulariy, killing the king's deer was made no longer a capital offence, but only punificd by fine, imprifonment, or abjuration of the realm : yet even in the charter there were fome grievous atticles, which the clemency of later princes have fince by fatute though fit to alter per affifas forefac. And to this day, in trefpalfes relating to the forett, voluntas reputalitur profaro; fo that if a man be taken hunting a deer, he may be arrelted as it he had taken a deer.

Forest-Towns, in Geography, certain towns of Suabia in Germany, lying along the Rhine, and the confines of Switzerland, and fulje it to the houfe of Aufiria. Their names are Rhinefield, Sickingen, Laufanburg, and I ald/but.

FORE-sTaff, an inftrument ufed at fea for tahing the altitudes of heavenly bodies. The fore-1taff, called alfo crofs-Aaff, takes its denomination hence, that the obferver, in ufing it, turns his face toward, the object ; in oppofition to the back-ftaff, where he tums his back to the object.

The fore or cro\{3-ftaff, confifts of a fraight fquare ftaff, graduated like a line of cangents, and four crofles or vanes, which dide on it. The firlt and thorteit of thefe vanes, is called the ten crofs, or vanc, and belongs to that fide of the initrument on shich the divifions hegin at three degrees and end at ten. The next longer vane, is called the thirty crofr, belonging to that Gide of the 1 taff in which the divitions begin at ten degrees and end at thirty, calied the thirty feale. The next vane is called the $\int i x t y$ crofs, and belongs to the fide where the divifions begin at iwenty degrees and end at fixty. The lait and longelt, called the rinety crofs, belongs to the fide where the divifions begin at thirty degrees and end at ninety.

The ufe of this intrument is to take the height of the fun and ftars, or the diftance of two ftars: and the ten, thirty, fixty, or ninety crofies, are to be ufed according as the altitude is greater or lefs; that is, if the altitude be lefs than ten degrees, the ten crof is to be uled; if above ten, but lefs than thirty, the thirty crofs is to be ufed, \&c. Note, For altitules greater than thirty degrees, this inftrument is not fo convenient as a quadrant or fernicircle.

To obferve an Alitude by this infrument.- Apply the flat end of the flaff to your eye, and love at the upper end of the crofs for the centre of the furn or tar, and at the lower end for the herizon. If you fee the thy interad of the horizon, flide the crofs a little neave the eve; and if you fee the fea inftend of the horizon, thide the cofs, father from the eye; and thus continue rwoving till
.ee exality the for or ates centre by the $t$ p of Fscaller the crof, and the thrizon by tie boitom thew of. Then the lecrees and minutes, cut by the ianer edge of the Fortar. crobs upon the fate of the An poultar to the crofs you ule, give the shtude of the fan or thr.

If it be the marinion atitade you want, continue your obiervation as lonz as you find the altitule increafe, ftill moving the crus neater to the eve. By fubtracting the meidian altitu?e thus found from 90 degrees, you will have the zenth dikance. To work accatately, on allowance mul be made for the beight of the eye above the furface of the fea, viz. for one Englih foot, 1 minute; for 5 feet, $2^{\frac{1}{2}}$; for $1=$ feet, $3^{\text {r }}$; for 20 feet, 5 ; for to feet, $\bar{i}$, \&c. Thele mimutes lubtracted from the altitude oblerved, and added to the zenith diftance obierved, give the true altitude and zenith diftance.

To otferve the difance of two fors, or the moon's difance from a far, by the forc-faff-A Aply the indtrument to the eye, and looking to both ends of the crofs, move it nearer or farther from the eye till you fee the two ftars, the one on the one end, and the other on the other end of the crof; ; then the decrees and minutes cut by the crofs on the fide proper to the vane in whe give the laars dillance.

FORESTALLER, a perfon who is guilty of foreftaling. See the next article.

FORESTALLING, in Latu, buying on bargaining fur any corn, cattle, victuals, or metchandife, in the way as they come to fairs or markets to be fold, before they get thither, with an intent to tell the lame again at a ligher price.

The punifhment for this offace, upon coavicton at the quarter feffions by two or more witnelies, is, for the firf time, two months imptifonment and the luts of the goods, or the value ; fur the fecond offence $t^{1 . e}$ offender fhall be imprifoned fix months, and lofe double the value of the goods; for the third ofience he thali fuffer imprifonment during the king's pleafure, forfeit all his goods and chattels, and thand on the pillory : but the itatute does not extend to maltiters buying barley, or to badgers licenfed.

FORESTER, a fworn officer of the forelt, appointed by the king"s letters patent, to walk the fureit at all hours, and watch over the vert and venifon; alfo to make attachments and true prefentments of all trefpaffes committed within the forett.

If a man comes into a foreft in the right, a forefter cannot lawfully beat him before he makes fome refiltance; but in cafe fuch a perion refifts the foretter, he may juitify a battery. And a forelter ihall not be gueittioned for killing a trefpaffer that, after the peace cried to him, will not farrender himfelf, if it be not done on any former malice; though, where trefpaficrs in a fureff, \&c. do kill a perfon that oppofes them, it is murder in all, bectule they were engased in an unlawful act, and therefore maliec is implied to the perfon kilied.

FORETHOUGHT fetosy, in Scas Law, figtifics promeditated murder. Sce Mirpg! m .

FORFAR, a torn of Scotland, and capital of the county of that name, fituated in ㅊ. Lat. 56. 25. W. Lo.g. 2. 32. This town, with Dundce, Cupar, Prilh, and St Andiew's, jumly lind one memher to the Beith farliames., It itnds in the great

## $\mathrm{F} O \quad \mathrm{M} \quad\left[\begin{array}{ll}6 & ]\end{array} \mathrm{F} O \quad\right.$ O

 to the fea, mimot in a fraight line, about $j=$ miles Ing and Leswist four and five mites broad, bounded on the cuath fide by gentic hills, and on the north by the Grampion mountais.

Icrater is a very ancient town, and was once a royal r-blener. Here Malcolm Canmore beld his firt pariiarsent in $\mathbf{1 0 5 7}$. The ruins of his palace are itill to be Sen on the top of an artificial mount of a circular form, afting upen a bale of about three acres of ground, and riarg $; 0$ feet high above the plain. The late of Forfar, it:etching two milec in lengil from ealt to weft, and haif a mile in bieadth, and covering the palace on the north, attorded not only a plentiful fupply of water for every furnofe, but alfo added to the frength of the piace. This lake which abounds with trout, pike, perch, and eel, has been greatly reduced by draming; and Sne mar! has been frumd in itrata from tho to fix and eight feet dsep, with mofs below ten feet deep.

Within this lake were formerly two itlands raifed by art, with buildings on each; to which Margaret, Malcoln: Canmore's queen, retired after the deceafe of hor hatoand. Part of the ruins of thele edifices are ifill to be feen.

Little is known of Forfar till the middle of the $t \rightarrow$ th century, except an act paffed in the 13 th parliament of Jame: VI. 21it July, 1593 , in the following words, which affords a foccimen of the manners and language of the times, "Our foveraine Lorde, underfanding that be acte and ordinance maid anent obfervation of the Sabbath-daie within this realme, the mercatte-daie of the burgh of Forfare, being the head burgh of the fchire, quhilk was Sundaie, is taken from them; and his hienefle not willing that they in onie waies fuld be prejudged hereby, therefore his hieneffe, with advite of the ettaites of this prefent parliament, alteris and changis their laid mercatte-caie from Sundaie to Fridaie, and willis the famen Fridaie oukly to be their mercatte-daie to them in all times hereafter; and the famin to Itande with the like priveleges and freedomes as the Sundaie did of before." The market day has been long held on Saturday.

During the ufurpation of Oliver Cromwell, a detachment of his forces, atter facking Dundee, came to Forfar and burnt all the public records of the place; and the only charter the town now has is one granted by Charlcs II. after his reftoration, confirming all its sncient rights and privileges.

As an evidence of the ignorance and barbarity of the times, it appears from the records of the trials kept in the charter-cheit of Forfar, that nine perfons were condemned and burnt here for witchoraft betwist the vears 1650 and 1662 . Thefe innocent people were 211 tried by a fpecial commifion from the lords of the frivy council at Edinburgh; and although the commifion exprefsly difcharged torturing them on purpole io cxtort a confeffion of their guilt, yet, as it wav then thought meritorious* to obtain confeffion of guilt by whatever means, many inhuman cruelties were exercifed upon the unfortunate objects; particularly, an iron boot was drawn upon one of their legs. and a wedge driven with great force between it and the leg. Another influment, ftill carefully prelirved here, was likewife ufed, and is called the suzch bridie. It is made If iron in the thape of a dog's colhar, with two pikes
on the infide, aionat four inches diftant and too and a fuffor. half lones. Thefe pikes were put intu the mouth, and thire. the collar afterwards buckled ftrait on the bach of the head, to which was aflised mn iron chain, whereby the condommed pertons were led to the place of execution called the Piou-Feld, about a quarter of a mile to the northward of the tusn.

The lirects of Foffr are rather irregular: but many of the houfes are neat and well buik. Otnaburgs and coarfe linets are manufactured here; and many of the inhabitants are employed in making a coarfe kind of ihoes.

Forfar-Shire, a county of Scotiand, of which Forfar is the capital. Including Angus, Glenila, Glenefk, and Glenprofin, it extends between $4^{2}$ and 50 miles from eaft to welf, and t 6 were broadent, though in fome places the breadth does not exceed five miles. On the north it is divided from the Brae of Mar by a ridge of the Binchinnan mountains ; it is bounded on the fouth by the frith of Tas and the Britih ocean, on the eaft by Mearns, and on the welt by Perthhire. Part of the Grampian mountains runs through this county, which is agreeably diverfified with hill and dale. It produces fome lead and iron, together with freeitone, flate, and limetone. Coarfe linens and fail-cloth are the chiet manufactures of the county. It is well watered with lakes, rivers, rivulets, and fountains, fhaded with large forefis, roughened with brown mountains and waved with green hills interfperfed with fie!ds and meadows, and adorned with fine feats and plantations. Their heaths and woods abound with hart, hind, roebuck, and moor game; their ftreams are focked with trout and falmon. Their hills are covered with flocks of theep, and their fields afford plentiful harveits of wheat and all forts of grain. The mountains to the weft and north are inhabited by Highlanders: but the Lowlanders poffefs the towns and champaign country, and are remarkable for their politenets and hofpitality.

The population of this county in 1801 amounted to $9-778$. But in the following table is exhibited a view of its population, at two differert periods.

FORFEITURE, originally fignihes a tranfgreffion or ofitnce againt fome penal law. Ithe word in formed of the bafe Latin firiffafura; whence forfaifura and forfaizura, and the Freach forfuit. Forisfátura comes of forifacere; which, according to Ihdore, fignines to " hurt or offend," facere con:ra ratonem; and which is not imprubably derived of foris " out," and fucere," to du," q. d. an action out of ru'e or contrary to the rules. Borel will have forfat derived from the ufing of force or viulcuse: L, bincau, in his gloftary, will have forifata propealy to fignify a mulct or amend, not a forfit; which latier he derives from the Bas-Bieton forfed, " a penalty."

But, with us, it is now more frepuently uled for the efiect of fuch tranfgreltion; or the lufine fonce right, frivilege, eftate, honour, oface, or effer, its confequence thercof; thas for the trandarepon itfelf.

Forfeiture difers from corffenion, it that the former is mure general; while conficition is forticulaly apflied to luch thing as beemene fonfitel to the binge
 nobody clams.

Forfizures may be eitleer in civil or continai cras.

T] $\quad \mathrm{F} O \mathrm{R}$
eftate for life or years, may forfeit it many ways, as well Fne as by treafon or felony; luch as alienation, claiming a greater eftate than he hath, or allirming the reverlion to be in a ftranger, \&c. When a tenamt in tail make leafes not warranted by the itatute; a copyholder commits wafte, refufes to pay his rent, or do fuit of court; and where an eftate is granted upon condition, on non-performance thereof, \&c. they will make a forfeiture.

Entry for a forfeiture ought to be by him who is nest in reverfion, or remainder, after the ellate for feited. As if a tenant for life or yeat commits a forfeiture, he who bas the immediate reverfion or remainder ought to enter, though he has the fee, or only an eftate. tail.
II. Forfeiture in criminal cafes is twofold ; of real, and perfonal eftates.

1. As to real eitates by Attander in high treat fon, a man forfeits to the hing all his lands and tenements of inheritance, whether fee-fimple or fee-tail ; and all his rights of entry on lands and tenements, which he had at the time of the offence committed, or at any time afterwards, to be for ever velted in the crown; and alfo the profits of all lands and tenements, which he had in his own righi for life or years, lo long as fuch intereft thall fubift. This forfeiture velates $B / x, k, o r=$ bachwards to the time of the treafon committed; fo at coworm. to avoid all intermediate fales and encumbrances, but not thofe before the fact : and therefore a wife's jointure is not forfcitable for the trealon of her huiband; becaufe fettled upon her previous to the treafon committed. But her dower is forfcited, by the exprefs provition of itatute 5 and 6 Edw . VI. c. It. And yct the huband thall be tenant by courtefy of the wife's lands, if the wife be attainted of treafon; for that is not prohibited by the itatute. But, though after attainder the forfeiture relates back to the time of the treaion committed, yet it does not take effect unlefs an attainder be had, of which it is one of the fruits; and therefore, if a traitor dics before judgment pronounced, or is killed in open rebellion, or is hanged by martial law, it works no forfeiture of his lands: for he never was attanted of trafon. But it the chief juatice of the Ling's bench (the fupreme coroner of all England) in perfon, upon the view of the body of him hilled in open rebellion, records it and retums the aecord into his own court, both lands and guods ilall be forfeited.

The natural juftice of forfeiture or confifation of property, for treafon, is founded on thi, confideration : That lie who hath thus violated the fundamental priacipes of govermment, and broken his part of the original contract between hing and people, hath abandoned his connexions with fociety, and hath no longet any night to thofe advantages which before belonged to him perely an a member of the community ; among which facial aciantages, the right of tranfenting or tranfmitting property to whels is une of the clief. Such forieiture, moseover, wherely his pulterity muft furier as well as lianfelf, with help to rettrain a man, not only ly the fante of his duay, and dreat of perfonal punihment, but alfo by his pathom and natural affections; aud will internll every dey nelent and relation he has to keep hine from offendiag: acordias to that 1, waiful letament of (iicoo, " nec iom me frat quan

 cmicires pa"chts ratubicue ration.." And therefore Aulus Cafecilius, a Roman lawyer in the time of the tiumbirate, ufed to hoalt that he had two reafons for defifiting the power of the tyrants; his old age and his want of chiidren; for chiidren are pledges to the prince of the fanher's obedience. Yet many nations have thought, that this pollmuncus punilhment furours of hardluip to the imocent; efpecially for crimes that do not llike at the very root and foundation of fociety, as treafon againit the government expresly docs. And therefore, although confifations were very frequent in the times of the earlier emperors, yet Arcadus and Honorius, in every other intance but that of treafon, thought it more jutt, iti e/li prenam, ubi et nova c?; and ordered, that " peccala fius teneant autores, nec alecrius progrediatur mitu;, quam repcriatior delituon;" and Jultiaian alio made a law to reftrain the punifhment of relaions; which directs the forfeiture to go, except in the cafe of crimen macifitis, to the next of kin to the delinquent. On the other hand, the Macedonian laws extended even the capital punifhment of treafon, not only to the children, but to all the relations of the delinquent; and of confe their eflates munt be alfo forfeitec, as no man was left to inherit them. And in Germany, by the fanous golder bull (copied almoft rerkatim from Juntinian's code), the lives of the fons of fuch as confpire to kill an elector are fpared, as it is exprefied, by the emperor's farticular hounty. But they are deprived of all their effects and rights of fuccelfion, and are rendered incapable oi any honour ecclefallical and civil: to the end that, being always poor and neceffitous, they may for ever be accompanied by the infamy of their father; may languin in continual indigence; and may find (fays this mercilefs ediat) their runidment in living, and their relicf in dying."

In England, forfeiture of lands and tenements to The crown for treafon is by no means derived from the sendal policy, but was antecedent to the eflablithment of that fyftem in this illand; being tranfmitted from our Saxon ancellore, and forming a part of the ancient Scandianvian conttitution. But in certain treafons relating to the coin (which feem rather a fpecies of the rrmen fol/a than the crimen luefie maiefatis), it is provided by fome of the modern latutes which conftitute the once, that it diall work no forfeture of lands, Gave only for the life of the offerders; and by all, that :t fall not deprive the wife of her dower. And, in orde: to abolin fuch hereditary punilhment entirely, it was enafted by flatute 7 Amn. c. 21. that, after the deceafe of the late pretender, no attainder for treafon 1 ould extend to the difnheriting of any hair, nor to the prejudice of any perion, other than the traitor himdff. By which the law of fore:tures for high trea-- $n$ would by thix time have bee: at an end, had not a tob fer quent flatute intervened to give them a longer duThe lindory of this matter is fomewhat finand worthy obicreation. It the time of the An, the crime of trention in seotind wis, by the in many refiest, diferent fom that of tha؛ M Meland, and percicutarly in its conserguence

in both pats of the united kingdons. In nerv-ma- Forieitnre. disling thele laws, the Scots nation and the Englifh houfe of commons ftruggled hard, partly to maintain, and partly to acquire, a total inmunity from forfciture and corruption of blood: which the houfe of lords as firmly ?evilted. At length a compromife was agreed to, which is etrablified by this flatute, viz. that the fane crimes, and no other, flould be treafon in Scotland that are fo in England; and that the Englifh forfeitures and corruption of blood thould take place in Scotland till the death of the then pretender, and then ctafe throughout the whole of Great Britain : the lords artfully propoing this temporary claufe, in hopes (it is faid) that the prudence of fucceeding parliaments would make it perpetual. This has partly been done by the itatute 17 Geo. II. c. 39 . made in the year preceding the late rebellion), the operation of thefe indemnifying claufes being thereby thll farther fufpended till the death of the fons of the pretender.

In petit treafon and felony, the offender alfo forfeits all his chattel interefts abfolutcly, and the profits of all treehold eftates during life; and after his death all his lands and tenements in fee fimple (but not thofe in tail) to the crown, for a very fhort period of time: for the king fhall have them for a year and a day, and may commit therein what wafte he pleafes; which is called the king's year, day, and wate. Formerly the king had only a liberty of committing watle on the lands of felons, by fulling down their houfes, extirpating their gardens, ploughing their meadows, and cutting down their woods. And a punifhment of a fimilar fpirit appears to have obtained in the criental countries, from the decrees of Nebuchadnezzar and Cyrus in the books of Daniel and Ezra; which, belides the pain of death inflicted on the delinquents there fpecified, ordain, " that their houfes thall be made a dunghill." But this tending greatly to the prejudice of the public, it was agreed in the reign of Henry I. of England, that the king flould have the profits of the land for one year and a day in lieu of the deftruction he was otherwife at liberty to commit : and therefore magna charta provides, that the king thall only hold fuch lands for a year and a day, and then reltore them to the lord of the fee, without any mention made of wafte. But the flatute ${ }_{17}$ Edward II. de prerogativa regis, feems to fuppofe, that the king flhall have his year, day, and watle; and not the year and day inflead of wafte: which Sir Edward Coke (and the author of the Mirror before him) very jufly look upon as an encroachment, though a very ancient one, of the royal prerogative. This year, day, and wafte, are now ufually compounded for; but ctherwife they regularly belong to the crown : and after their expiration the land would naturally have defended to the heir (as in gavelkind tenure it Rill does) did not its feudal quality intercent fuch defent, and sive it by way of efcheat to the lond. Thete forfitures for felony do alfo arife only upen attaind $\cdot \mathbf{r}$; and therefure a felo de fe forteits ro latids of imeritance or frethold, for he never is attwinted as a fiton. They likewife relate bark to the ti:ne the ofence was commited as well as forfeitures Gor treafon, fo an to avoil all internedtate charges and co:viy nces. This may be hard upma fuch as have waseriy enared with the ofender; but the cruelty and treach mat lie on the port, not of the law, but

## $\mathrm{F} O \quad \mathrm{~F}$

Forfeiture of the criminal: who has thus knowingly and dilhoneftly involved others in his own calamities.
2. The forfeiture of goods and chattels accrucs in every one of the high kinds of offence; in high treafon, or mifprifion thereof, petit treafon, felonies of all forts whether clergyable or not, felf murder or felony de $\int e$, petty larceny, itanding mute, \&c. For flight alfo, on an accufation of treafon, felony, or even petit larceny, whether the party be found guilty or acquitted, if the jury find the flight, the party thall forfeit his goods and chattels: for the very flight is an offence, carrying $w^{-1 / h}$ it a ltrong prefumption of guilt, and is at lealt an endeavour to elude and to ititle the courfe of juftice prefcribed by the law. But the jury very feldom find the fight : forfeiture being looked upon, fince the valt increafe of perfonal property of late years, as too large a penalty for an offence to which a man is prompted by the natural love of liberty.

There is a remarkable difference between the forfeiture of lands and of goods and chattels. (I.) Lands are forfeited upon attainder, and not before; goods and chattels are forfeited by conviction. Becaufe in many of the cafes where goods are forfeited, there never is any attainder; which happens only where judgment of death or outlawry is given : therefore, in thofe cafes, the forfeiture mult be upon conviction, or not at all; and, being neceffarily upon conviction in thofe, it is fo ordered in all other cafes, for the law ioves uniformity. (2.) The forfeiture of lands has relation to the time the fact was committed, fo as to avoid all fublequent fales and encumbrances: but the forfeiture of goods and chattels has no relation backwards; fo that thofe only which a man has at the time of conviction fhall be forfeited. Therefore a traitor or felon may bona fide fell any of his chattels, real or perfonal, for the futtenance of himfelf and family between the fact and conviction; for perfonal property is of fo fluctuating a nature, that it paffes through many hands in a fhort time; and no buyer could be fafe, if he were liable to return the goods which he had fairly bought, provided any of the prior venders had committed a treafon or felony. Yet if they be collufively and not bona fide parted with, merely to defraud the crown, the law (and particularly the ftatute 13. Eliz. c. 5.) will reach them ; for they are all the while truly and fubftantially the goods of the offender : and as he, if acquitted, might recover them himfelf, as not parted with for a goud confideration; fo, in cafe he happens to be convicted, the law will recover them for the king.

FORFEX, in Roman antiquity, was a way of drawing up an army in the furm of a pair of fheers. It was intended to receive the cuncus or wedge, if the enemy fhould make ufe of that figure. For when the firfex opened to admit the wedge, they had an opportunity of defeating their defign, and cutting them in pieces.

FORFICULA, the LARWig, a genus of infects belonging to the order of coleoptera. See Estonology Index.

FORGE, properly fignifies a little furnace, wherein fmiths and other artificers of iron or tteel, \&c. heat their metals red hot, in order to foften them and render them more malleable and manageable on the anvil.

An ordinary forge is nothing but a pair of bellows, she nozzle of which is directed upon a fmooth area, Vor. IX. Part I.
; $\quad I \quad \mathrm{I}$
on which coalo are placed. The nozzie of a pair of bellows may be alfo directed to the bottom of any furnace, to excite the combuttion of the coals plared there, by which a kind of forge is formed. In laboratories, there is generally a imall furnace confifting of one cylindrical piece, open at top, which has at its lower fide a hole for receiving the nozzle of a double bellows. This kind of forge furnace is very convenient for fufions, as the operation is quickly performed, and with few coals. In its lower part, two inches above the hole for receiving the nozzle of the betluw, may be placed an iron plate of the fame diameter, fupported upon two horizontal bars, and picrced near its circumference with four holes diametrically oppofite to each other. By this difpofition, the wind of the bellows, puibed forcibly under this plate, enters at thete four holes ; and thus the heat of the fire is equally diftributed, and the crucible in the furnace is equally furrounded by it. This contrivance is ufed in the forgefurnaces for melting copper, with this difference only , that thefe furnaces are fquare, which is a matter of no confequence.

As the wind of bellows ftrongly and rapidly excites the action of the fire, a forge is very convenient when a great heat is to be applied quickly: but it is not fuitable when the heat is to be gradually increafed.

The forge, or blaft of bellows, is ufed in feveral operations in fmall ; as to fufe falts, metals, ores, \&c. It is alfo much ufed in works in the great, which require ftrong heat, without much management; and chiefly in the fmelting of ores, and fufion of metallic matters.

Forge is alfo ufed for a large furnace, wherein iron ore, taken out of the mine, is melted down : or it is more properly applied to another kind of furnace, wherein the iron-ore, melted down and feparated in a former furnace, and then calt into lows and pigs, is heated and fufed over again, and beaten afterwards with large hammers, and thus rendered more foft, pure, ductile, and fit for ufe.

Forge, in the train of artillery, is generally called a travelling furge, and may not de improperly called a portable fmith's fhop: at this forge all manncr of fmith's work is made, and it can be ufed upon a march as well as in camp. Formerly they were very ill contrived, with two wheels only, and wooden fupporters to prop the forge for working when in the park. Of ldte years they are made with four wheek, which anfwers their purpofe much better.

FORGE for red-lot Balls, is a piace where the ball: are made red hot before they are fired off: it is buil, about five or fix feet below the furface of the ground, of itrong brick-work, and an iron grate, upon which the balls are laid, with a large fire under them.

FORGER, in Lazw, one guilty of forgery.
FORGERY (from the French forger, i. e. accudare, fabricare, " to beat on an anvil, forge, or form,") may be defined at common law, to be " the fraudulent making or alteration of a writing, to the prejudice of another man's right :" for which the offender may fuffer fine, imprifonment, and pillory. And alfo, by a variety of ftatutes, a more fevere punihment is inflicted on the offender in many particular cafes, which are fo multiplied of late as almot to become genera!. We tha! mention the principal inflances.

By fatute 5 liliz. c. 14. to forge or make, or kuow 13

17を界
rergery. incty to puith or give in cridence, any forgel deed, court-roll, u. sil!, with intent to afte, the right of real 1roperty, either freehold or copyhold, is punined by a forfeiture to the party grieved of doable colts and damenes; by ftanding in the pillory, and having both liv cars cut off, and his nollsils ilit and feared; by forfiture to the crown of the profits of his lands, and ty perpetual imprifoment. For any furgery relating ts a term of years or annuly, bonl, obligation, acquitance, releafe, or difcharge of any dejt or dematad of any perfonal chattels, the tame forfecture is given to the party grieved; and on the oftender is iatlictel the pillory, lofs of one of his ears, and half a jear's imprifonment : the fecond ofience, in both cales, being fclony without benefit of clergy.

Befles this general act, a multitude of others, fince the Revolution (when paper credit was firft eltablithed), have inflicted capital punilhment on the forging, altering, or uttering as true when forged, of any baik bills or notes, or cther fecurities; of bills of credt iflued from the exchequer; of South Sea bends, suc.; of lottery dickets or orders; of army or nuy debentures; of Fait lucia bond, ; of writings under fial of the London or royal exchange affurance; of the hand of the receiver of the pre-fines, or of the accountantgeneral and certain other officers of the count of cin? cery; of a letter of attomey or other power to receise or transfer itock or annuities; and on the perfonating a proprietor thereo, to receive or trinsfer fuch annuitiec, fock or dividends: alfo on the perfonating, or procuring to be perfonated, any feaman or other perfon, entitled to wages or other noval emoluments, or any of his perfonal reprefentatives; and the taking, or procuring to be taken, any falle oath in order to obtain a probate or letters of adminiflration, in order to receive fuch payments; and the forging, or procuring to be forged, and likewife the uttering or publithing, as true, of any counterfeited feaman's will or power: t) which may be added, though not itrictly reducible to this head, the counterfeiting of Mediterranean paifos under the hands of the loros of the admiralty, to protect one from the piratical itates of Barbary; the forging or imitating of any ftamps to defraud the public revenue; and the forging of any marriage regiter or licente: all which are, by difinct act of parliament, made felonies without beneft of clergy. By fatutes 13 Geo. III. c. 52 . \& 59. forging or counterfeiting any Itamp or mark to denote the ftandard of gold and tilver plate, and certain other offences of the like tendency, are punilhed with tranfportation for $1+$ years. By itatute 12 Geo. III. c. A's. certain frauds on the tamp-duties, therein defcribed, principally by aing the fame ftam-s more than once, are made fingle thony, and liable to tranfportation for feven years. And the fame punifhment is inflicted by ifatute 13 Geo. 111. c. $3^{8 .}$. on fuch as counterfeit the common * al of the corporation for manufacturing plate glats (thereby erected), or knowingly demand money of the comany by virtue of any writing under fuch counterSct ital.

1here are alfo two other general baws with regard ir forgery; the one 2 Gco. II. c. 25. whereby the fift Whence in forging or procuring to be forged, acting or , Whines therein, or uttering or publifhing as true, ary frged deed, will, bond, reriting obligatory, bill of en-
change, fromiliory note, indorfement or affignment thereuf, or any acquittance or receipt for money or goods, with intention to defraud any perfon (or corporation), is made felony without benefit of clergy. And by ttatute 7 Geo. II. c. 22. it is equally penal to forge, or caufe to be forged, or utter as true, a counterfeit acceptance of a bill of exchange, or the number of any accountable reccipt for any note, bill, or any other fecurity for money, or any warrant or order for the payment of money, or delivery of goods. So that, through the number of thele general and fpecial provinicts, there is now hardly a cafe poffible to be conceived, wherein forgery, that tends to defraud, whether in the name of a real or fictiticus perion, is not made a capital crime.

Forging, in Laze, the act of Forgery.
Forging, in fmithery, the beating or hammering iron on the anvil, after having firft made it red hot in the forge, in order to extend it into various forms, and fathion it intc various works. See Forge.

Thert are two "ays of forging and hammering iron. One is by the force of the hand, in which there are ufually feveral pcrions employed, one of them turning the iron and hamnering likewife, and the relt only hammering. The other way is by the force of a wa-ter-mill, which railes and works feveral huge hammers beyond the force of man; under the ftrckes whereof the workmen preient large lumps or pieces of iron, which are futtaned at one end by the anrils, and at the other by iron chains faftened to the ceiling of the forge. See Mill.

This laft way of forging is only ufed in the largett works, as anchors for thips, \&ic. which ufually weigh feveral thoufand pounds. For the lighter works, a fingle man ferves to hold, heat, and turn with one hand, while he hammers with the other.

Each purpole the work is detigned for requires its proper heat ; for if it be too coid, it will not feel the weight of the hammer, as the fmiths call it when it will not batter under the hammer; and if it be too hot, it will red fear, that is, break or crach under the hammer.

The feveral degrees of heat the fmiths give their iruns, are, firit, a blood-red heat; fecondly, a whiteHame heat; and thirdly, a fparkling or welding heat.

FORISFAMILIATION, in Law. When a child, upon receiving a portion from his father, or otherwife, renounces his legal title to any further fhare of his father's fucceflion, he is faid to be forisfomiliated.

FORK, a well known intrumet, confiting of a handle and blade, divided at the end into two or more points or prongs.

The pitch-furk is a large utenfil of this conftruction, employed in hay-making, \&c.

The table fork, an inflrument now fo indifpenfable, did not come into ufe in England till the reign of James I. as we leam from a remarkable paffage in Coryat. The reader will prebably fmile at the folemn manner in which this important difcovery or innovation is related: "Here I will mention a thing that might have been fpoken of hefore in difcourfe ot the firft Italian townes. I obferved a cuftom in all thore Italian cities and townes through the which I paffed, that is not uled in any other country that I faw in my travels, neither do I thinke wat any other nation of Chriftendoras

## $\mathrm{F} O \mathrm{~B} \quad\left[\begin{array}{lll}1 & \mathrm{j} & \mathrm{F} O \\ \mathrm{R}\end{array}\right.$

sume dutin wee it, but only Itaiy. The Itation and alfo molt ittangers that are commorant in lasly, doe always at their neenis ufe a little forke when they eat their meate ; for while with their knife which they bold in one hand they cut the mente out of the difs, they faiten the forke which they hold in the otlier hand upo: the fime dith, fo that whatioever be be that fitting in the company of any others at meale thall unadviledly touch the dish of meat with his fingers from which all the table doe cut, he will give occafion of offence unto the company as having trantgrefied the lawes of good manners, infomuch that for his error he hall be at leat brow-beaten if not reprehended in wordes. This form of feeding I underftand is geserally ufed in all parts of ltaly, their forkes for the moit part being made of yrom, iteele, and fome of filver, but thofe are ufed only by gentlemen. The reafon of this their curiofity is, becaule the Italian cannot by any means indure to bave his dihn touchcd with fingers, feeing all men's fingers are not alike cleane. Hereuron I myfelf thought good to imitate the Italian fahion by this forked cutting of meate, not only while I was in Italy, but alio in Germany, and often times in England fince I came home: being once quipped for that frequently ufing my forke, by a certaia learned gentleman, a familiar friend of nine, Mr Lawrence Whitaker; who in his merry humour doubted not to call me a table furcifir, only for ufing a fcrke at feeding, but for no other caule."

FORLI, an ancient and confiderable town of Italy, and eapital of a territory of the fame name, in Romagna, with a bihop's fee. The public fiructures are very handiome; and it is feated in a fertile, healthy, and pleafant country, 10 miles fouth-eat of Faenza. and 45 north-ealt of Florence. E. Long. 12. 1. N. Lat. 44. 29.

FOR LORN-HOPE, in the military art, figrifies men detached from feveral regiments, or otherwife appoint$e d$, to make the firit attack in day of battle; or, at a fiege, to itorm the countericarp, mount the breach, or the like. They are fo called from the great danger they are unavoidably expofed to; but the word is old, and hegins to be obfolcte.

FORM, in Picyfics, denotes the manner of being peculiar to each body; or that which conftitutes it fuch a particular body, and diftinguifhes it from every other.

Mr Harnis ufcs the term form likewife in another fenfe, as an cfficient animating principle; to which he imppofes Uvid to refer in the firtt lines of his Metamorphofis,

## In no:'a fert aminels mutitas dicere formas, C'rapora.———

Thefe animating forms are of themfelves no objects either of the ear or of the eye; but their nature or character is underitood in this, that were tbey never to eaert their proper energies on their proper fubjects, the marble on which the fculptor exerefies his att would remain for ever thapelefs, and the harp from which the herper calls furth founds would remain for ever filent.

Thus, allo, the animating form of a matural body is neither its organization nor its figure, nor any other of thofe inferior forms which anake up the fyitem of
its vitible çutlitics: but it is the power, whinh is yet S..m. able to preduce, preferve, mid enpley thefe. It is ine - , -a, puwer, which firit move, and then conducts that la tent procefs, by which the acom becomes an oak, and the embrys becomes a man; by which dizetion is performed in plants and animals, atd, which departing, the body ceates to live, and its thembers putiefy : and by which every being produces another like itielt, and every feccics is contimued. In animals, it is that higher faculty, which by emploving the organs of fenfe, peculiar to them as animals, ditinguihes them as fenlitive beings from vegetables; and $\mathrm{it}_{\mathrm{i}}$ is alio that more noble faculty, which by its own divine vigour, matilted perhaps with organs, makes and denominates him a being intellective and rational. So that: Mr Harris reckons two forts of forms, thofe which are pallive elements, and thofe which are eflicient caules. And all of them agree in this, that they give to every being its peculiar and diftinctive charater : and on the whole he concludes, that form appears in part, to be an element, and in part an efficient caule, i. e. a caufe which affociates the contituent elaments of natural fubftances, and which employs the;n, when afluciated, according to their various and peculiar characturs.

The philofophers generally allow two principles of bodies: mater, as the common bafis or fubitratum of all; and form, as that which fpecifies and diftinguifhes each; and which added to a quantity of common mat ter, deternines or denominates it this or that ; woud, or fire, or athes, \&c.

Subltantial forms feem to have been firft broached by the followers of Ariftotle, who thought matter, under different modes or modifications, not fefiecient to conititute different bodies; but that formething fubitantid was neceflary to let them at a greater diftance: and thus introduced fubikantial forms, on the footing of fouls, which feecify and dittinguith animals. What led to this erroneous notion were the circumitances of life and death: For obterving, that, as foon as the foul was departed out of a man, all motion, refpiration, nutrition, \&ic. immediately ceated, they concluded, that all theic functions depended on the foul, and confequently that the foul was the form of the animal body, or that which conflituted it fuch: thit the foul was a fubttance, independent of matter, no body doubted; and hence the forms of other bodies were concluded equally fubitantial. But to this it is andwered, that though the foul be that by which a man is man, and coniequently is the form of the human body, as human; yet it does not follow, that it is properly the form of this body of ours, as it is a body; nor of the feveral parts thereof, contidered as diftinct from each other : For thofe feveral parts have their proper forms fo clofely comnected with their matter, that it remains infeparable therefrom long after the foul has quitted the body; thus ileih has the form of lleth, bone of bone, \&ic. long atter the foul is removed as well as before. The truth is, the body does not become incapable of performing its accullomed functions becaufe the foul has delerted it; but the foul takes its leave, becaufe the body is not in a condition to perform its functions.

The ancient and modern corpufeular philofophers, therefore, with the Cartefians, exclude the notion of fubitantial forms; and thow, by many arguments, that 13 2 the

Form.
the form is only the modus or manner of the body it is inherent in. And as there are only three primary modes of matter, viz. figure, relt, or motion, with two others arifing therefrom, viz. magnitude and fituation, the form of all bodies they hold to confift therein; and lippofe the variations thefe modes are capable of, fufficient to prefent all the variety obfervable in bodies.

Forms are ufually diltinguined into s/fential and $a c$ ciutnial.

Eflential. Though the five modes above mentioned, generally taken, be adventitious; yet to this or that body, c. $g^{r}$. to fire or water, they arc effential: thus, it is accidental to iron, to have this or that maguitude, figure, or fituation, fince it might exift in different ones ; yet to a knife or hammer, the figure, magnitude, and folition of parts, which conflitute it a hammer or knife, are cffential; and they cannot exift or be conceived without them. Hence it is inferred, that though there be no fubitantial, there are effential, forms, whereby the feveral fpecies of bodies become what they are, and are diltinguithed from all others.

Alcidental forms, are thofe really inherent in bodies, but in fuch manner as that the body may exift in all its perfection without them. Such as whitenels in a $\mathrm{wal}^{\prime}$, heat in water, a figure of a man in wax, \&c.

Form is allo ufed, in a moral lenfe, for the manner of being or doing a thing according to rules: thus we fay, a form of government, a form of argument, \&ic.

Form, in Law, the rules eftablifhed and requifite to be obferved in legal proceedings.-The formal part of the law, or method of proceeding, cannot be altered but by parliament; for if once thefe outworks were demolilhed, there would be an inlet to all manner of innovation in the body of the law itfelf.

Form, in carpentry, is ufed to denote the long feats or benches in the choirs of churches or in fchools, for the priefts, prebends, religicus, or fcholars, to fit on. Du Cange takes the nane to be derived from hence, that the backs of the feats were anciently enriched with figures of painting and fculpture, called in Latin furmere typi. In the life of St William of Rofchild, we meet with forma as fignifying a feat for an ecclefiaftic, or religious, in a choir; and in that of St Lupicin, we have formula in the fame fenfe. In the rule of the monaftery of St Cæfarea, the man who prefides over the choir is called primiceria, vel formari.

At fchools, the word form is frequently applied to what is otherwife termed a clafs. See Class.

Form alfo denotes the external appearance or furface of a body, or the difpofition of its parts as to the length, breadth, and thicknefs.

Form is alfo ufed among mechanics, for a fort of mould wherein any thing is fathioned or wrought.

Frinter's FORM, an affemblage of letters, words, and lizies, ranged in order, and fo difpofed into pages by the compofitor; from which, by means of ink and a prefs, the printed fheets are drawn.

Every form is enciofed in an iron chafe, wher in it is firmly locked by a number of pieces of wood; fome loms and narrow, and others of the form of wedges. Ithere are two forms required for every theet, one for
each fide; and each form confifts of mere or fewer pages according to the fize of the hook.

Hatter's FGRA, is a large block or piece of wood, of a cylindrical figure; the top thereof rounded, and the bottom quitc that. Its ufe is, to mould or fathion the crown of the hat, after the matter thereof has been beaten and fulled.

Papermake'r's Form, is the frame or mould wherein the fhects are fallioned. See Paper.

FORMA paUperis, in law, is when a perfon has juft caule of fuit, but is fo poor that he cannot defray the nfual charges of fuing at law or in equity; in which cafe, on making oath that he is not worth 51 . in the world, on all his debts being paid, and producing a certificate from fome lawyer that he has good caule of fuit, the judge will admit him to fue in forma pauperis; that is, without paying any fee to counfellors, attorneys, or clerk: the itatute in Hen. VII. c. 12. having enacted, that counfel and attorneys, \&c. fthall be affigned to fuch poor perfons gratis. Where it appears that any pauper has fold or contracted for the benefit of his fuit whilft it is depending in court, fuch caufe thall be thenceforth totally difmiffed; and a perfon fuing in forma pauper is fhall not have a new trial granted him, but is to acquicfee in the judgment of the court.

FORMAL, fomething belonging to or conftituting the form of a thing. See Form.

FORMALITY, the quality of a form, or formula; or that which conflitutes and denominates them fuch.

Formality, as defined in the fchools, is any manner wherein a thing is conceived; or a manner in any object, importing a relation to the underitanding, whereby it may be diftinguifhed from another object. Thus, animality and rationality are formalities. The Scottifts made great ufe of formalities, in oppofition to the virtualities of the Thomifts.

Formalities, in matters of law, are frequently ufed for the formulas themfelves, or the rules prefcribed for judiciary proceedings. In contracts of ftrict law, all the formalities muft be flrictly obferved: an omiffion of the leaft formality may ruin the whole convention.

The term is alfo ufed for a certain order or deco. rum to be obferved.

FORMAN, Andrew, archbiftiop of St Andrew's, earl of Pittenweem, and of Cottingham in England, one of the lords of the regency appointed by the ftates during the minority of King James V. of Scotland, legate à latere, primate of all the kingdom of Scotland, and archbifhop of Bourges in France, was defcended from the family of the Formans of Hutton in the fhire of Berwick, and is confidered to have been one of the belt ftatefinen of the age in which he lived. He was employed in 1501 , along with Robert Blackader archbithop of Glafgow and Patrick earl of Bothwell, to negotiate a match between Ja. IV. of Scotland and Margaret eldeft daughter of Hen. VII. of England, which next year was ratified by the Scottilh ambafladors. He was afterwards frequently employed as Scots ambaffador to Rome, England, and France, upon the moft important occafions. In 1514 he was tranflated from the fee of Moray, to which he had been appointed in 1502 , to that of St Andrew's. During the time of

Forman. his poffefling the former, he was employet as mediator betwist Poge Julins II. and Louis X II. of France, who were at that time at variance; and he happily fucceeded in conciliating the difference. Having taken leave of the Pope, he paffed through France on his return home, where he was hindly received by the king and queen, who beftowed upon him the bithopric of Bourges in France, which annually brought him in 400 tons of wine, 10,000 franks of golt, and wher fmaller articles. Befides all this, he was mult liberally rewarded by Pupe Julius, who promoted him to the archbilhopric of St Andrew's, as has been already mentioned ; conferred on bim the two rich abbeys of Dunfermline and Averbrothic; and made bin his legate is latere. At that time, however, there were two other candidates for the archiepifopal fee. The learned Gavin Druglas, bilhop of Dunkeld, having been nominated by the queen, had actually tahen polfellion of it; but John Hepburn, a bold and factious man, baving teen preferred by the monks, drove out the officers of Gavin Douslas, and placed a flrong garrifon in the cattle. So great was the power of this man, that when Ferman was nominated by the Pope, no ferfon could be found who durit proctain the bulls for his election. At lat Lord Home, at that time the moit powerful nobleman in Scotlan!, wis induced, by large promites, belides fome gitts of great confequence, among which was the donation of the abbacy of Coldingham to his youngett brother David, to undertake the talk. It was executed at Edinburgh and St Andrew's; to which places Lord Home's brother went with 12,000 men; though the duing of it, contrary to Forman's inclination, proved a fource of much trouble to that nobleman afterwards. The quarrel betwist Hepburn and Forman, however, was at laft terminated by the latter furrendering the billoupric of Moray, as well as fome years revenue of the archbifhopric itfelf; paying Hepburn alfo 3000 Fiench crowns annually out of his eceleliatical revenues. On the appointment of the duke of Albany to the regency, Hepburn endeavoured to undermine the primate's credit with that nobleman, by reprefenting him as one who had in a manner collected all the money in the country, and who confequently might endanger the tranquillity of the kingdom. Thefe infinuations, however, were but little regarded by the regent ; and Forman had the good fortune afterwards to make up a difference between him and the nobility, which was likely to be attended with much bloodihed. In 1517, the archbihop was appointed by the flates one of the Iords of the regency, on occafion of the duke of A1bany's going to France. We have already mentioned his embafly to Pope Julius II. In M•Kenzie's Lives we are informed, that in the collection of the Letters (f the Scottilh Kings from the year 1505 till the year 1626 , in the lawyers library, there is a letter from that pope to King James IV, wherein he not only highly commends Forman, but likewife promiles that at the firll creation of cardinals he fhould be made one. This letter is dated the 6th of May 151t: but the pope died before he had an opporienity of performing his promife. In the lame colieation there is a letter from the duke of Albany to Leo X. Julius's fucceflor, whereia he prefies the pope to advance him to the dignity of a cardinal promifid him by his predecelfor,
$13] \quad \mathrm{F}$ O R
and to continue him his legate à latere. Archbuhtop Furnese Forman died in 1521, and s.av vuried at Dunfermline. Dempiter fays that he wrote a book': againlt Luther, a Furming. book coneernmg the Stoic Philuluphy, and a Collection out of the Decretals.

FORMATIUN, in Plillfiply, an act whereby fomething is formed or produced. For the formation of the fietus in the womb, lee Asatomy, No 129. 110.

Formation of Stones. See Stosf.
Formation of Metals and Mincrals. See Metal and Miseral.

Formation, in Grammar, fignifies the manner of forming one word from another; thus accountany fis is formed from accountant, and this laft from account.

FORMEDUN, in Law, (breve de forma donationis): a writ that lies for a perfon who has a right to lands of tenements, by virtuc of any entail, ariling from the flutute of Weltm. 2. Ch. II.

This writ is of three kinds, viz. a defcender, remainder, and revetter. Formedon in defcender, lies where a tenant in tail infeofis a ltranger, or is diffifed and dies, and the heir may bring this writ to recover the lands. Formedon in remainder, lies where a man gives lands, \&c. to a perfon in tail, and for default of iffue or his body, the remainder to another in tail: here if the tenant in tail die without iffue, and a itranger abates and enters into the land, be in remainder thall have thi, writ. Formedon in reverter, lies where lands are entailed on certain perfons and their iflue, with remainder over for want of illue; and, on that remsinder failing, then to revert to the donor and his heirs : in this eafe, if the tenant in tail dies without inue, and alfo he in remainder, the donor and his heirs, to whom the reverfion returns, may have this writ for the recovery of the ellate, though the fame be aliena ted, \&c.

FORMIIE, or Forma, in Aucient Geography, a naaritime townof the Adjected or New Latium, to the fouthealt of Cajeta ; built by the Laced.emonians, (Strabo) ; called originally H.mmic, on account of its commodious harbour. An ancient municipium. Formian; the people; who were admitted to the liberty of the eity the very year in which Alexandria was built ; but not to the right of luffrage till a long time after the fecond Punic war, (Livy). Formie at this day lies in ruins, near a place now called Mula.

FORMICA, the ANT, a genus of infeits belenging, to the order of hymenoptera. See Extonolos, Brade.

The infeats called white ants, which ahoud in Afri ca and the Ealt radio, belong to the genus termes, which tee in Exromology Indix.

Formata Leo, the ghat hoz, fo called from its de vouring great numbers of ants. It is the caterpiliar or worm of a fly much retembing the libeche or dragun thes; and feeds chictly upon ant.
FORMING is usd for the at of giting beng or birth to any thing.

The word is sito fmply wed for giving the fugure to any thing. The puiser turas his witem at he pleafes. Geometry te.ches how to f.me all kinds ot figures.

It is likewife uid for the prodaing of a thirg thus, the hineanethis of the face began to be formed.

## $\mathrm{F} O \mathrm{P} \quad\left[\begin{array}{lll}14\end{array}\right] \quad \mathrm{F} O \quad \mathrm{R}$

F', lisz, ? qume of a Sirge, is the making lines of circumFimata, valla to fortify the camp, and difoling things for the attack of i i place in form.

They alio lay, to form a fquadron or battalion; neanigig to range the foldiers in form of a fivadron, $\Delta$ S.

Forming the Line, is drawing up infantry, cavalry, a) attillery, into line of batele. See Livi.

Fonming is alfo ufed in grammar, in fetking of cerain tenfes of verbs, which are made from others by a change of certain letters. The prefent tenfe is formed tion the infinitive. Compound and derivative words iflo, and even all that have any etymology, are faid to be formed.

FORMOSA, an ifland in the Pacific ocean, between $119^{\circ}$ and $122^{\circ}$ of E. Long. and $22^{\circ}$ and $25^{\circ}$ N. Lat. about 100 niles eatt of Canton in China. It is fubject to the Chinefe: who, however, notwithftanding its vicinity, did not know of its exiftence until the year $1+30$. It is about 85 leagues in length, and 25 ${ }^{\circ} \mathrm{n}$ breadth. A long. chain of mountains, which runs from north to fouth, disides it into two parts, the eaftern and weftern. The Dutch formed an eftabliihment in the weftern part in $163+$, and built the fort of Zeatand, which fecured to them the principal port of the iland; but they were driven from thence in 1659 or 1661 by a celebrated Chinefe pirate, who made hithfelf matter of all the weftern part, which afterwards fitumitted in $\mathbf{1 6 8 2}$ to the authority of Kang-he emperor of China.

This weftern part of Formofa is divided into three Witinct governments, all fubordinate to the governor of Tai-ouns, the capital of the illand, who is himfelf lubject to the viceroy of the province of Fokirs.

This illand prefents extenfive and fertile plains, walesed by a great number of rivulets that fall from the eftern mountans. Its air is pure and wholefome ; and the earth produccs in abundatire, corn, rice, and the greater part of other grainc. Moft of the Indian fruits are found here, fuch as oranges, bananas, pine-apples, guavas, papaws, cocoa nute: and part of thofe of Europe, particularly peaclics, apricots, figs, raifins, chefnuts, pomegranates, water melon, \&ic. Tobacco, fusar, pepper, camphire, and cinnamon, are alto common. Horfes, theep, and goats, are very rare in this iland: there are even few hogs, although thefe animals abound in China. Doneftic poultry, fuch as fowls, seefe, and duchs, are exceedingly plenty ; pheatants slfo are fometimes feen; and monheys and ftags have multiplied fo much, that they wander through the country in large flocks.

The inhabitants of Formofa rear a great number of onen, which they ufe for riding, from a want of hories ard mules. They accuftom them early to this kind of fervice, and by dally exercife train them to go as well and as expeditioully as the beft horfes. Thele wen are farmikied with a bridle, fadd!e, and crupper. A Chincele louks as big and proud when mounted in this manner, as if he were cariked by the fieil Barbary c. nfer.

Wholefume water fit for drinking is the only thing wantirg in the ifland of Formofa. It is very extraordinary, that every kind of water in it is a deadly poitwn io Atrangers, for which no remedy has hitherto $\because$ ? $\because$. foun. 3. "One of the governor's fervants," fays

Father de Mailh, "whom I had in my train (a ftrong Formefs. and robett man), trufting too much to the force of his comtitution, would not believe what had been told fins concerning this water: he drank fome of it; and died in lefs thin five days, after every medicine and antidote had been adminillered without fuccefs. Thers is none but the water of the capital which can be drunk: the mandarias of the place therefore alway took care to tranfport a fuffiency of it in carts ir our ufe." Our autliur adds, that at the bottom of it moentain a league diftant from Fong-kan-hien there is a fpring that produces a ftream, the water of which is of a whitih blue colour, and fo nosious, that no one can approach it.

There are few mulberry trees in Formofa, confequently litile filk is made in the country. Numerous manufatures, however, would foon be introcuced into it, were the Chinefe permitted indiferiminately to tranfport themfelves thither, and to form eftablihments in the illand. Thote who go to it muft be protected by paffports from the Chinefe mandarins, and thefe palfports are fold at a dear rate; fecuritits are befides required. This is not all : when they arrive, money muit be given to the mandarins who are appointed to examine thofe who enter or quit the illand, and who generally difcharge this duty with the moft rigid feverity. If they give no prefent, or offer only a trifle, they meet with !ittle mercy; and are fure to be fent back, whatever paffport they may have. The Chinefe, through policy, connive at thefe exactions, to prevent too great a nnmber of people from emigrating to this illand, which is rendered a place of great importance by its proximity to China. They fear, and with great reafon (efpecially fince Tartar emperors have been on the throne), that if any revolt hould happen in Formofa, its intluence might fpread and occalion great difturbance in the whole empire. On this account, the Tartars kept a garrifon there of 10,000 men: which they take care to change every three years, or even oftener if they judge it neceflary.

Belides the capital, the Chinefe have alfo two other eities, and fome villages, where they inhalit alone; for they do not permit the Indians, who are their fubiects, to live among them; they fuffer none to remain but thofe who are either their llaves or domeftics.Thefe Indians are united into 45 villages; 36 of which lie to the north, and 9 towards the fouth. The northern villages are very populous, and the houles are built almoft after the Chinefe manner. The habitations of the fouthern iflanders are only heaps of huts or cottages of earth. In thefe huts they have neither chairs, benches, tables, beds, nor any piece of furniture; the middie part is occupied by a hind of learth or climney, raifed two feet hish, and conftructed of earth, upon which they drels their victuals. Their ordinary tood is rice, other fmall grain, and the game which the catch by courfing or kill with their arms. Thefe illanders run with fuch furprifing fivifinef, that they can almoft outhrip the fleetcit greylound. The Chinefe attribute this agility to the precaution they take of confining their huees and reins by a clule bardage until the age of 14 or 15 . Their favourite arms are lances, which they dart to the ditance of 60 or 80 feet with the greatelf dexterity and precifion. They ule buws and arrows, and can kill a phewat on wing with

## 

Formif. as much certainty as an Lurepean forefman could with a fufec. The'd rent le are very dirty in their momer of eating. They bave ncither thates, dhat, nor fpour, nor even the frall fick's uid in Clina. Whar ner they drels is placed on a plain board or mat, and they make ufe of their fagers for convering it to their mouths. They eat flefh half raw; and provided it has bee: only prefented to the five, it appears to them excellent. Their beds are formed of frefligathered leares. They go almost nakel, and war orily a piece of cloth which hans from their girdec to the:s knees. Thole among them, who, accurting to the judgment of the chiefs of the villuge, have bonne arsy the price for agility in running or desterity in the chafe, obtain the horourable privilcge of making on their fhin, by a very painful operation, feveral fantaftical figures of fiovers, tees, and ammals. All have the right of blachening their teeth, and of wearing ornaments os bracelets and crowns made of thells and cryttal.

The i.landers who inhabit the northern part, where the climate is fomething colder, clothe themfelver with the thins of the itags which they kill in lunting. Thiey make a kind of drefs of them without ilecres, that pretty much refembles a dalmatic, or veltment wo:n at the aliar by the Ruman clergy. They wear on their heads caps in the form of a cylinder, made of Falm leaves, and ornamented with feveral crowns placed one above amother, on the top of which they fix plumes compofed of the feathers of a cock or pheafant.

The marriage ceremonies of the inhabitants of Formola approach near to the fimple laws of nature. Thiey neither purchafe, as in China, the women whom they époufe, nor does interelt ever prefide over their unions. Fathers and mothers are fcarcely ever confulted. If a young man has a mind to marry, and has fixed his affection on a young girl, he appears for feveral lays Allowing near the place where fhe lives with a mutical iviltrument in his hand. If the young woman is fatified with the figure of her gallant, hie comes forth ant joins him: they then agree and fettle the marriage contract. After this they give notice to their parent, who prepare a wedding dinner, which is always given in the houfe where the young woman refides, and where the bridegroom remains without returning again to Eis father. The young man afterwards comiders the house of his father-in-law as his own. He becomes the whole fupport of it, and he has no farther connetion with that of his father; like married women in Europe, who generally quit their paternal home in order to live with their huband. Thefe illanders therefore feldom offer up vows for obtaining male children: they prefer daughters, becauic they procure them fons-in-law, who become the fuppurts of their cld-age.

Although the Formofans are entirely rabjected to the Chinefe, they fill preforve fome remams of their ancient govenment. Each village ciurta three or frur old men from among thofe wino have the seatelt reputation for probity. By this c'vice they bectens the rulers and judges of the rett of the hamket. 'they have the power of finally determing all differmen; and if any one thould refule to abide by their jugge. mert, he $\because$ ould be inmediately bainled from the vi!
 and none of the indations we datornats date to aceive !im
'A ie utives pay in grtin tie tribute impofod on Whem by the Chincfe. To traulto cioy thing that concens the laying on and comentint of $\because$ i. . govemment has ertublhed a Chincte is o. . . . . Who is obliged to learn the law yage and an :n. .,
 cruel extortioners to the mife. Wle 1eople, whan th: ought rather to protect: they are luch int.in! leeches, that they can farcely ever be fati-fed. Thi daily and dumehtic tyranoy has already ciule! t:e it fuction of thrce vilige in the funthern part of ther intind, where formerly there nere twels. The inhe bitants of thefe villages revolted, expelied their inter preters, refufed to pay tribute any lonscr to the Chinefe. and have united themelves to the independent nation in the eaitern part of the illand.

It was in the itland of Formofa that Johar Stres afirms to have feen with his own eyes a man who had a tail more than a fuot in length, covered with act hair, and greatly refembling that of an on. 'ihis main with a tail faid, that his deformity, it it was one, i roceeded from the climate, ard that all thofe of the fouthern part of the ifland were born with tails like his.- But lulon Struys is the only author who attetts the esiftence of this extraorlinay race of men; no other writer who has fpoken of Formofa makes the leaft mention of them. Another circumfance, no lef fingular, and which appears to be little better authenticated, is, that in this illand women are not permitted to bring forth children before they are 35 , although they are at liberty to marry long before that age. Rechteren * thus exprefies hinfelf concerning this Arange cultom:
" When women are firft married, they bring no chil- $E_{\text {cmif }}$ Indis dren into the world : they nuult, before that is permit- $V$ Vyages ted, have attained the age of 35 or 37 . When they vol. v. p. are big with child, their prieflefles pay them a viit, ${ }^{n o}$ and tread on their bellies with their feet, if it be nece:fary, and make them micarry, with perhaps greater pin than they would have in being brought to bed. It would be not only a thame, but an enornows crime, 10 bring forth a chiild before the teram preicribed. I have leen fome females who had already detroyed the frait of the:r womb 15 or 16 times, and who were biy for the 1 th when it was lawful for them to bring forth a living child."

To our defcription of Furmofa we fhall add the fol. lowing account of the dreadtul difater that lately befel this unhappy illand. The details were converyd by a letter from Peking, a.dreffed to M. Beriin, and La: d the 1 th of July $\mathrm{I}_{7} \mathrm{~s} 2$
" The waterv of the wean have well nigh deprived Chima of one of its mott valuabie wartine ponfotions. The illand of Tay-ouan, known in Europe by the name of Formoia, has been amolt fwallowed un by them. It has been reported here, that part of the mountain which divides the illand has funk and dilappeared : that the reft has been obertumed: and that the grcater part of the inhabitants have p ailied. Suck lave kean for fome days the fopatar reports in this c quital. Government, luwever, has put a hop to them, 'y informing the put of the real tocth: fuch as it in

## 

I then Las been amounced to the emperor by the officers who - have this frall portion of his territories undre their frsrifdiction. I cannot do better than trayfribe wiat they lawe written. The defpatches of the Chinefe of-- cer, addretied to the emperor, run thus :
"Bechen, governor-general of the prosinces of [oLiva and Tche-Kyang-ya, viceroy of Fokien, and rthers, make known to your majetty t!e diatter chat has lately befallen the ihand of Tay-ouan. Nlun-ha-hon, and other principal offcers of this ithand, have requainted us , that on the 21 t t of tive fourth moon (May 22. 1782), a moft furions wind, accompanied with heavy rain and a fwell of the feagteater than ever remenbered, had kept them under continual apprehenfion of being fwallowed up by the waves, or buried in the bowels of the earth, from the hour of $y n$ until the hour otei (A). This dreadful tempett feemed to blow at the fame time from the four cardinal points of the compafs, and continued with equal violence during the above-mentioned time. The buildings where the tribunals were held, the public granaries, the barracks, falt warehoufes, and works, have been totally deltroyed, and every thing they contained is loft : warehonfes and work fhops, as well as private houfes, for the moit part, prefent nothing but ruins and heaps of rubbih. Of 27 hips of war which were in the harbour, 12 have difappeared; two others have been dahhed to pieces, and $\mathrm{I} \circ$ are fhattered in fuch a manner that they are rendered entirely unfit for fervice; other finaller velfels of different fizes, above 100 in number, have Mared the fame fate; eighty have been fwallowed up ; five others, which had juft taken in a lading of rice for Fokien, have funk, and their cargoes, which amounted to 100,000 bufhels, are wholly lolt. With regard to other veffels, whether fmall or great, which had not entered the harbour, 10 or 12 of the largeit are reckoned to have been fwallowed up; thofe of inf:rior fize, as well as a prodigious number of barks, boats, and other fmall veffels of different kinds, have difappeared, without leaving the leaft piece of wreck behind them. As the whole illand has been covered with water, the provifions have been either fwept away, or fpoilt fo as to render them prejudicial to the health of thofe who ufe them in their prefent ftate. The crops are entirely loft. When we fhall have been informed of particulare, we thall not fail to give your majelty the earlieft intelligence of them.-After having received this letter from Mon-ha-hon, and the other principal officers refiding et Tay-ouan, I employed the utmoft diligence to give every affitance in my power to this unfortunate illand; and I ordered the travelling commifary, and Trey-oner, general of the province, to get particular information of the number of thofe who have perifhed, of the houfes deftroyed, and of the quantity of falt and other provifions that has been loft: I have likewife enjoined them to rebuild with the utmolt expedition the tribnnals, granaries, aad other public edifices; to defpatch proper perfons to fearch for the veffels and thips that have difappeared; to repair thote which are not altoge-
ther unfit fur fervice, and to fend immediately to the Formofa, neighbouring countries for falt and other neceflary pro- Formula. vifions: but above all, to afcertain in the molt accurate manner the different loffes fuitained by the inhabitants, and the precile number of people that have perithed, in order that I may be able to give the fulleft information to your majefty."
'The emperor of China caufed a particular detail of thefe lolles to be publihed, together with the following letter:
"Tchang-yu, \&c. Tchem-hoei-Thon-Tfong-ton of Fokien, and others, have informed me of the difmal event that hath taken place in the illand of Tay-ouan, which is a dittrict of the province of Fukien. They have written to me, that on the 2 flt of the fourth moon. [Here the emperor repeats what is contained in the preceding letter, and continues thus]: 1 command Trong-tou to get the beft information he can of the different loffes fuitained by the inhabitants of the illand, and to tranfmit the particulars to me, in order that I may give them every affiftance to repair them. My intention is, that all the honfes which have been thrown down fhall be rebuilt entirely at my expence; that thofe be repaired which are only damaged; and that provifions, and every thing which the people fland in immediate want of, be fupplied them. I thould feel much pain, were even one among them to be neglected: I therefore recommend the utmoft diligence and itricteft inquiry, as I am defirous that none of my fubjects fhould entertain the leaft doubt of the tender affection which I have for them; and that they fhould know that they are all under my eyes, and that I myfelf will provide for their wants. With regard to my thips of war, tribunals, and public edifices, let them be reftored to their former ftate with money taken from the public treafury, and let the general account of the whole expence be laid before me."

The miffionary who fent this account farther fays, From thefe letters it evidently appears, that this difafter happened in confequence of an earthquake ; but he adds, that the volcano which occafioned it mult be at a prodigious depth below the fea. He does not pretend to give an explanation of it ; he is contented with obferving, that the fame fcene feems to have paffed at the illand of Formufa as at Lima and Libon.

FORMULA, or Formulary, a rule or model, or certain terms prefcribed or decreed by authority, for the form and manner of an act, initrument, proceeding, or the like.

Formula, in Church-Ififory and Theology, fignifies a profeffion of faith.

Formula, in Medicine, imports the conftitution of medicines, either fimple or compound, both with refpect to their prefcription and confittence.

FORNACALIA, or Forstanm, in Roman antiquity, a feltival inftituted by Numa, in honour of Fornas, the godde's of ovens; wherein certain cakes were made, and offered in facrifice before the ovens.

FORNICATION (Fornicatio, from the fornices in Rome, where the lewd women prottituted themfelves for money), is whoredom, or the ast of incontinency, between fingle perions; for if either of the parties is married, it is adultery. Formerly court leets had power to inquire of and punith formication and adultery; in which courts the king had a fine affefied on the offenders, as apnears by the book of Domefday.

In the year 1650 , when the raling powers found it for their intereft to put on the femblance of a very extraordinary ftrictnefs and purity of morals, not only inceit and wilful adultery were made capital crimes, but alio the repeated act of keeping a brothel, or committing fornication, were, upon a fecond conviction, made felony without benefit of clercy. But, at the Reitoration, when men, from an abhorrence of the hypocrify of the late times, fell into a contrary extreme of licentioufneis, it was not thought proper to renew a law of fuch unfalhonable rigour. And thefe offens.es have been ever fince left to the feeble coercion of the Spiritual court, according to the rules of the canon tuw; a law which has treated the oftence of incontirestice, nay, even adaltery itfeif, with a great degree of tendernefs and lenity ; owing perhads to the comitrained celibacy of its firit compilers. The temporal courts therefore take no cognizance even of the crime of adultery otherwile than as a private injury. See ADULJ Y゙RY.

The evils of fornication, which too many wilh to confider as no fin, may be judged of from whe following a exticulars.

1. The malignity and mora! quality of each crime is not to be eftimated by the particulas effect of one oftence, or of one perfon's offending, but by tise gencral tendency and confequence of crimes of the fame nature. In the prefent cafe, let the libertine confier and fay, what would be the confequence, if the fame licentioninets in which he indulges were univerial? or what thould hinder it becoming univerfal, if it be immocent or allowalhe in him ?
2. Tomication fuppofes proftitution; and by profinution the uetims of it are brought to almott cer-- in mifery. It is no fmall guatity of mifery in the augregate, which, between wait, diteafe. and infnlt, anfored by thofe outcaio of human fociety who inf. it populous cities; the whole of which is a genemal confequerice of fimication, and to the increatic and Sol. IX. Part I.
 (ival cuntat ...s.
3. Furni ation produce ! Bit of angoverable lend neis, which introduce the mone angrated crime of folucion, ajultery, vilation, \& . The crinanal in dukences bewteen the fiso prepare an exty admithon for every fin that lech, it: they are, in low life, urutl. ly the fint flage in men's progides to the mot defperate villanies; and in high life, to that lamented dinis.uvenets of pinciple, which maniteds itfelt in a prut a of public condust, and a contcrapt of the obligations of religion and moral probity.
4. Fonnication perpetuates a difafe, which may be accounted one of the forent maladie of human nature, and the effects of which are faid to vifit the contitution. of even dittant generation.

The paffion being natural, proves that it was in. tended to be gratified; but under what restrictions, of whether without any, muft be collecited from differet : confiderations.

In the Scriptures, fornication is abfolutely and pe. remptorily conderned. - Out of the heart procend evil thoughts, murders, adulteries, fornication, theit: falfe witneis, blafphemies; thele are the things which deñle a man.' Thefe are Chrit's own words; and one word from him upon the fubject is final. The apoltles are more full upon this topic. One well-known 1 . fage in the Epitle to the Hebrews may fland in the place of all others; becaufe, admitting the authority by which the apoftles of Chritt fpake and wrote, it is decifive. 'Marriage and the bed undefled is honou:able amongl all men, lut whorenongers and adulte:er, God will judge; which was a great deal to fiy, it a time when it was not agreed even amongh philouphers that fornication wai a crime.

Upon thi fubjeft Mr Palcy adds the following obfervations *.
"The Scriptures give no fanction to thofe anteritics which have been fince impoled upon the world under the name of Chrifts religion, as the celibacy of the clergy, the praile of perpotual virsinity, the protithone conculitus cans grasta asere; but uith a juit knowledge of, and recard to the condition and interent of the human fpecies, have provided in the marriarge of one man with one woman an adequate grotitication for are propenfities of their matare, and hase seitsaned thens to that gratification.
"The avowed toleration, and in fome comtrics the licenfing, taxing, and regulating of public brotliel, his appeared to the people an authoriking of fornication, and has contributed, with other caulte, lo far to siliate the public opinion, that there is no practice of which the immorality is lo little thought of or acknowidged, although thare are few in which it can more plainly be made out. The legilators who late patronitad receptacles of prontitution ough: to bave forcfeen this eifect, as well as confidered, that whateior facilitates fornication, cimintines marringe. And as to the ufual apology for this relaned difcipline, the dinger of gieater enormities if accefs to protitutes were too ftrictly watched and prohibited; it will be time enough to lo ik , that, after the laws and the magitrites have do ne their utmos. The greateft vigilance of beth "ill do is more, than oppofe fome bound, and fome difficu'. tics to this intercourfe. And after abl, thefe preteaded C) fears

## F O R $\left[\begin{array}{lll}18 & \mathrm{R}\end{array}\right] \quad \mathrm{O} \quad \mathrm{R}$

Lirmis fearsare without foundation in experience. The wen fir Ferres. are in all refpects the moft virtuous in countries where the women are moit chate.
" If furnication be criminal, all thofe incentives which lead to it are acceffaries to the crime: as laficiwious converfation, whether expreffed in obfcene or difguifed under modett phrafes; alfo wanton fongs, pictures, books; the writing, publihing, and circulating of which, whether out of frolic or for fome pitiful profit, is productive of fo extenfive a mifchief from fo mean a temptation, that few crimes within the reach of private wickednefs have more to anlwer for, or lel's to plead in their excufe.
" Indecent converfation, and by parity of reafon all the reft, are forbidden by St Paul, Eph. iv. 29. 'I.et no corrupt communication proceed out of your mouth;' and again, Col. iii. 8. 'Put filthy communication out of your mouth.'
"The invitation or voluntary admifion of impure thoughts, or the fuffering them to get poffelfion of the imagination, falls within the fame defcription, and is condemned by Chrift, Matt. v. 28. 'Whofoever looketh on a woman to lutt after her, hath committed adultery with her already in his heart.' Chritt, by thus enjoining a regulation of the thought, frikes at the root of the evil."

FORNIX, in Anatomy, is part of the corpus callofum in the brain; lo called, on account of a ditant refemblance to the arches of ancient vaults when viewed in a particular manner.

FORRAGE, in the military art, denotes hay, oats, saley, wheat, graf, clover, \&c. brought into the camp by the troopers, for the fuftenance of their horfes.

It is the bulinefs of the quartermalter general to appoint the method of forrage, and poft proper guards for the lecurity of the forragers.

FORRES, a parliament town of Scotland in the county of Murray, claffing with Invernefs, Fortrofe, and Nairn. It is a fmall well built town, pleafantly lituated on an eminence near the river Findhorn. The country about it has a cheerful appearance, having a few gentlemen's feats, with fome plantations about them. O. a hill weft of the town are the remains of a caitle; and a melancholy view of a number of fandhills, that now cover that tract of land which was formerly the eftate of a $\operatorname{Mr}$ Cowben in the parih of Dyhe. This inundation was occalioned by the influx of the fea and the violence of the wind. It had been the cultom to pull up the bent, a long fiiry grafs near the thore, for litter for horfes, by which means the fand was loolened, and gave ray to the violence of the fea and wind, which carried it over leveral thoufand acres if land. The peofic having been prevented from pulling up any more of the grals, the progrefs of the fand is now nearly fopped, and the fea has retired; but the vind has blown fome of the fand from the hills over Cilm:e! Grant's hand, and dettroyed near 100 acres. A find bank, which is all dry at low water, runs out from this place for feveral miles into the Murray Frith. Som. of the land, which has been long forfaken by the ater, is now beginning to be ufeful again, and is turned ints grazing land. It Forres, coarle linen and fewing thread are made. Eait from the town, and on lie left hand gade of the road, is a remarkable obe-
liR, faid to be the molt ftately monument of the Gothic hind to be feen in Europe. It has been the fubject of many able pens; but totally overlooked by Dr Johnfon, who fays, " At Forres we found good accommodation, but nothing worthy of particular re-mark."-lt is thus defcribed by Mr Cordiner, in a letter to Mr Pennant: "In the firit divifion, underneath the Gothic ornaments at the top, are nine horfes with their riders marching forth in order: in the next is a line of warriors on foot, brandilhing their weapons, and appear to be thouting for the battle. The import of the attitudes in the third diviion is very dubious, their expreffion indefinite. The figures which form a fquare in the middle of the column are pretty complex but diftinct; four ferjeants with their halberts guard a canopy, under which are placed feveral human heads which have belonged to the dead bodies piled up at the left of the divifion; one appears in the character of executioner fevering the head from another body; behind him are three tmompeters founding their trumpets, and before him two pair of combatants fighting with fword and target. A troop of horfe next appears, put to tlight by infantry, whofe firit line have bows and arrows; the three following, fisords and targets. In the lowermolt divition now vifible, the horfes feem to be feized by the victorious party, their riders beheaded, and the head of their chief hung in chains or placed in a frame; the others being thrown together belide the dead bodies under an arched cover. The greateft part of the other fide of the obelik, occupied by a fumptuous crofs, is covered over with an uniform figure, elaborately raifed, and interwoven with great mathematical exactnefs. Under the crofs are two augult perfonages, with fome attendants, much obliterated, but evidently in an attitude of reconciliation ; and if the monument was erected in memory of the peace concluded between Malcolm and Canute, upon the final retreat of the Danes, thefe large figures may reprefent the reconciled monarchs. On the edge below the fretwork are fome rows of figures joined hand in hand, which may alfo imply the new degree of confidence and fecurity which took place, after the feuds were compofed, which are characterized on the front of the pillar. But to whatever particular tranfaction it may allude, it can hardly be imagined, that in fo early an age of the arts in Scotland as it muit have been raifed, fo elaborate a performance would have been undertaken but in confequence of an event of the molt general importance ; it is therefore furprifing, that no ditincter traditions of it arrived at the era when letters were known. The height of this monument (called King Sueno's flone) above the ground is 23 feet; befides 12 or $t 5$ feet under ground. Its breadth is 3 feet 10 inches by 1 foot 3 inches in thicknefs."

FORSKOHLEA, a genus of plants belonging to the decandria clafs. See Botany Indew.

FORSTERA, a genus of plants belonging to the gynandria clafs. See Botany Index.

FORT, in the military art, a fmall fortified place, environed on all fides with a moat, rampart, and parapet. Its ufc is to lecure fome high ground, or the paffage of a river, to make good an advantageous polt, to deiend the lines and quarters of a iege, \&c.

Forts are made of different figures and extents, ac-

## Furre <br> Fort.

Vitrised Fort:
cording as the ground requires. Some are fortified with battions others with dernibattions. Some again are in form of a fiquare, others of a pentagon. A lort differs from a citade', as this latt is built to command fome torn.

Korla! Fort, is one whore line of defence is at leant 26 fithoms long.

Star FORT, is a fonce or relubt, contituted by reentering and falient angles, baving commonly from five to eight points, and the lides tlanking each other.

Irirified Forss, a very fingulur kind of itructures found in the lighlands and northern parts of Scotland, in which the walls have the appearance of being meltud into a folid mats, fo as to refemble the lava of a volcano, for which indeed they have been taken by leveral perfons who have vifited them.

Thefe walls were taken notice of by Mir Williams an engineer, who wrote a treatile upon the libject, and was the firft who fuppofed them to be works of art; other naturalits having attributed them to a volcanic origin. Thefe works are commonly fituated on the tops of fmall hills, commanding an extenfive view of the adjacent valley or low country. The area on the fummit, varying, as is fuppoled, according to the number of cattle the proprietor had to protect, or the dependents he was obliged to accommodate, is furrounded with a high and Atrong wall, of which the ftones are melted, moft of them entirely ; while others, in which the fufion has not been to complete, are funk in the vitrified matter in fuch a manner as to be quite enclofed with it; and in fome places the fufion has been fo perfect, that the ruins appear like mafles of coarfe glafs. Mr Williams has not only abfolutely determined the walls in queftion to be the works of art, but has even hazarded a conjecture as to the manner in which they were conitructed, and which, aczording to him, was as follows. Two parallel dikes of earth or fod being raifed, in the direction of the intended wall, with a fpace between them fufticient for its thicknets, the fuel was put in, and fet on fire. The stones bet adapted for the purpole, called the plum ondding foine, are everywhere to be found in the neighbourhood. Thele vere laid on the fuel, and when melted, were kept by the frame of earth from running off; and by repeating the operation, the wall was raicd to a fufficient leight. This opinion of the tones being thrown in without any order, is thought to be confirmed by the circumitance of there not being anywhere a large one to be feen, nor a ttune laid in any particular direction, nor one piece which hats not in lome degree been affected by the fire. Mit William; mentions a fact tending to confrm bis lypothelis, vil. of a brick kiln fituated on the declivity of an eminence, fo as to be expofed to the wind, which happening to rife brikly one time when the kiln was burning, to increafed the heat, that the bricks were melted, and ran, like a lava, for a confiderable way down the hill.

The opinion of Mr Williams has been embraced by feveral other authors; particularly Mr Freebairn and 1) Anderfon, the latter having publithed two treaties, umon thefe buildings in the Archeologin. In the tane \%ork, however, we meet with a paper by the Hon. Daines Earrington, in which the athor exprete quite difeecnt ientiments. He obferves, that Mr Williand,
and the cther matiquaries who fuppore the wails in $v$ quellion to be woaks of int, imeque that the reaton of thair being combactat is this manmer mow the ignorance of coment, which in theik rans:c......; ; mvalied in Scotiand: but with repat in thin comentitance, he fary, th..t if one hide of the will whty was heated, and that to y command ir : ait, ih. matter in fution wond in atll lik imend if An wo the bottom, without operating in wh con i. () the loofe ftones theown in amongt it. T14 whas ney of the wall, being vitrifia! only on one ! ith, is iat? at remarkable, and takes place in mout of the torts of thikind to be met with at prefent: |eut with re: it it it, Mr Berrington oofences, that he himidt an beet twice in the Highland of S :otland, and hat found very few hills of any height which wete clothed with wood; the trouble thercfure of carrying it ul to the top of fuch a mountain would be vely contiderahle. Bat to this it might eafly be replicul, that we camot by any means argue from the preient thate of the bilis in the Mnghlands to their thate in a very remose period of antiquity. At that time, it is neither inapoliole, nor in the leatt improbable, that mot of the hilis in Scotland were overgrown with wood, or at any rate, there undoubtedly was plenty of peat, which is ftill ufed as fuel in Scotland, and which afords fuch a ttrong heat as to be advantageouly employed in imeleing iron, as we are informed by M. Magellan. A third particular mentioned by Mr Willians is, that thefe enclofuras were intended as places of defence; and in fupport of this opinion he alleges, that there are dried wells found within moll of them. But on this Mr Barrington obierves, that fheter from the weather was alfo neceflary, " apon the top of a ble:ik Scoteh hill, whilt whiky (or a luccedaneum for it would be often in greater requeft than the bare element of water." This objection, however, as well as the lath, is evidently very frivolous; for thefe buiddings might have roofs as well as any other; and whatever necelity there mighit be for whitky occafionally, water was certainly an indifpenfable requifite.

Mr Barrington having thus given his reafone for difenting from the opinion ot Mr. Wiliams and the antiduaries jult mentioned, proceed, to date his own. He tells as, that having travelled for 21 years the mok mountainous circuit in WVale, he has frequently o! ferved enclotures of dry Rones, particu'arly a long tract ia the wettern pat of Mtrionethhire, called in the lansuage of the country Dufryn, i. c. the zale. On firlt viening thetic fmall encloftres made with walls, of thick ftones, he was at a lof to ind gine how it could be worth while to conitruct fuch itrong fences for to inconfiderable a piece of ground as they encloled; but, on examining the adjacent country, he found it almot entirely covered with itonos of a dimilar kind; and, of confequence, the fmaller the fpace to be cleared, the lefs expentive would be the removal. " For the Fame reafon (fays he), fuch dry nalls are often of a great thicknef, and fometimes the comers of the enclofures are filled with dones to a great width, this being the only pomble nowa of procuring palture." 'lo a practice of the fame kind our :athor would aferibe the origin of the works in queition: but the objection occurs very itrongly, that the walls in siotland are vitrified, and it is not to be fuppoled that fuch trouble

mancer. Thi olyection, our author onve, would indeed he unanfocralile, ou the fuppolition that the wind tion vas made our pupple to flrengthen the walls of the fortict; lunt (ays he) may not the vitrification bave teen ore fine by volcanos, or by what are called ihomurices. The fame effect may be produced likeVife on dry walls of itone by lightning patheng along -hern. The loofe flones in either cate would not be receled becaufe they were glaffy, and would be piled un in the donce of the enclolum: as the great point ?nen thefe orcafions is to rlear the ground, and remove $\therefore$ e encumbering tomes to the fmallett ditlance. One of the adrocates for the deligned and not fortuitous virification, fays, that the pieces he had procured did vot eclemble what is called lasa. But every volcano nut necceffrily an Ethat or a Vefuvius; and confe. quently the marter difgorged from the crater mut perpetually vary both in fubtance and form. Vitrified maffe, larger or fmaller, will likewife be produced by the fame heans. It may be contended, indeed, that pafture thus procured, by clearing the ground, would be more convenient at the bottom or on the fides, than on the top of the hill: but to this I anfuer, that in rocky countries you mult get what pittance you can of loil, and often it will happen that the only detached and removeable ftones are on the fummit. When fuch enclofures have been made, they became very convenient for putting cattle into; and hence perhaps fome of the wells which Mr Williams hath mentioned."

Our author concludes his differtation on this fubject by obferving, that if vitrification anfwered the purpoie of cement, it is very extizordinary that the ancient inhabitunts of Scotland did not apply it to the houfes or huts in which they contantly lived, but referved this troublefome and expenfive procef merely for a fortincation, which might not perhaps be ufed in half a century againft an enemy. On this it is ahmoft fuperfluous to obferve, that in the ages of barbarity and bloodihed, in which thefe enclofures, whether natural or artificial, were fuppofed to be ufed as fortrefics, war was to frequent, that a defence againit an enemy might feem to be nocefliary every day, inilead of once in half a century. Bcfore we proceed further in the argument, howcver, it will be neceflary to give rome account of the fituation and arpearance of thefe fortreffes.

According to Mr Cardonnell, the largelt of them is fituated on the hill of Knockfarrill, to the louth of the valley of Strathpeffer, two miles weft from Dingwall in Rofsinire. The enclofure is 120 feet long and 40 broad within the walls; ftrengthened on the outfide with works at each end. $A$ range of habitations feems to have been erected againft, or under, the thade of the outward wall; of which thofe on the fouth fide leem to have been wigher and larger than thofe on the north. There are two wells in the middle, which, on being clested out, filled with water. On the fkirts of the hill to the fouth are many detached buildings; which, from the ftratum of dung found on removing tha ruins, appear plainly to have been ufed for fecuring the cattle. This place leens to have becn anciently of confequence, :und the refidence of fome powerful chicf, from a road which leads through the alis to the north-veft fer. To the cat of the vorks
cerable way along the ridge of the hill. The ead Forts. nes: the fort feems to have joined the outer wall, and - conated either of two parallel walls, clofed above, with a pallage between them under coter, or a high wall broad enough to walk on. In this wall there is the vellige of a brak about the middle, over which a bridge has been laid, to be drawn up or romoved as occalion might require.

The fort next in confequence to that of Knockfarril is fituated on the hill of Craig- Phacrich near Invemefs, " which (fays Mr Cardonnel) has this pecaliar circumitance, that there appears to have been two ritrified walls quite round the area. The inner one feems to have been very high and ttrong; the outer wall but low: probably the face between was intended for lecuring their cattle, as there are no remains of dry-ftone buildings, fuch as are found near the reft. Several parts of this outer wall appear quite entire, fticking to the firm bare rock, where it was firit run. The area within the inner wall is near 80 paces long and 27 broad." Of this we have an account $\ddagger$ by $\ddagger$ Erin Pijis Alexander Frafer-Tytler, Efq. profeflor of civil hiftory Tranfaca. in the univerfity of Edinburgh, who vilited it in the Vol. II. year ${ }_{17} 82$. The hill itfelf is a fmall conical eminence, fhis II. forming the eaftern extremity of that ridge of moun- Ar. 11 . tains which bounds Loch Nefs on the north-weft fide. It is fituated about a mile to the north of Invernefs, and is accemible on two different quarters, viz. the weft and fouth-eaft ; the former affording entrance by a narrow level ridge joining the hills on Loch Nels, and the latter by an eafy afcent from the high gromd above Invernefs. On approaching the hill from the weft, we firf meet with a road cut through the rock from the bottom to the top, in moft places is feet broad and nearly as deep; winding, for about 70 feet, with an eafy ferpentine direction, by which we gain an afcent over a filcep rock otherwife quite inacceffble from that quarter. This road, in our author's cpinion, is undoubtedly the work of art, and the vitrified matter on the top is the only thing which indicates the effect of fire; there being neither an appearance of pumice-1tone, lava, nor bafaltes, about the hill otherwife. There is indced plenty of plum-pudding ftene; which fome have fuppofed to be of the nature of volcanic tufa; but this opinion is rejected by our author as erroneous. " But the circumftance (fays be) which in my apprehenfion evinces, in the moft fatisfactory manner, that thefe appearances of the effect of fire on the fummit of this hill are not the operation of nature but of art, is the regular order and dif. pofition of thofe materials, the form of the ground, and the various traces of $\mathrm{k} i l l$ and contrivance which are yet difcernible, though confiderally defaced either by external violence or the obliterating hand of time? " To inveftigate this matter regularly, he begins with the winding road already mentioned, and which is cyidently cut through the rock for the purpole of gais. ing an eafy afcent from the level ridge to the fummit, which would otherwife have been impracticalle. In afcending by this road, there apparar, towards the middle, on the right hand, a fmail phatform overhang ing the paflage, and inclining by a very gentle declivity to the very edge of the rock. Fuat ctormous thons; tre phoced upers the photiorm, and on the edge and

## 

Vitried eafacnity of it, which hase evident? ! col a abded iy rose at into that postion; it be ing impolinte that they could have retted there, had they bees rollded duma from the higher parts. 'The obvious reaton ior placins? them in fuch a nefition has been, that on an ainan of danger they might be projected into the path below, Which could be done by the curt of a very few men: 2n 1 when this was dons, the pallage would be entirely obltructed, or at lealt rendered fo dificult that it cond be dctended by a few againl any number of aftilants. Sone other large thones are placed on an eminence to the left, probably with a view to bloch w, a hollow channel, by which an enemy might have attemyted to afcend. When we come to the top of the hill, a few feet below the rampart which crowns the whole, there appears an outward wall, approaching on the dides of the hill fo near the upper rampant, :s to have only a trench of 10 or 12 feet will between them. This onterard wall is in fome places folors as to be almont level with the rock, though in other places it rife, to the height of two or three fect; but even where loweff, it may be traced by a line of vituified matter ficking fatt to the rock all alons, and neariv of the Gme breadth, which is about nine feet. The remain of this wall are throngly vitrificd, except in one place on the north fide, where, for about 70 yards, the sampart is formed only of dry tones and earth. At the eall file, where the hill is more accethble, there is a prodigions mound of viufied matter, estending itielf to the thicknef, of above 40 feet. At the foutheat corner, and adjoining to this immenie mound, is an outwork, confiting of two femicircular vitribed waik, with a narrow pais cut through them i:t the middle; which appears to have been ato her, and per. haps the principal, entry to the fort.

The inner wall, furrounding the fumit of the hill, enclufes an oblong level area of about 75 vards long and 30 broad, rounded at each of the ends like the outward wall. It is of confiderable height, and nearly of the fame thicknefs with the outward one.-It has fome appearance of hoving been defended with four turrcti or battions: but the traces are fo imperfeet, that Mr Tytler does not lay much itrefs on his obfervations in this refpect; a number of fnall tumuli of earth, with a ftone in the centre, were more difcernible. On the eaft fide a portion of the internal fpace appears feparated from the reft by two ranges of fones fixed frongly in the earth, and forming a rightangled parallelogram. "This feparation (fays our author) is immediately difcernible by the eye, from this circumitance, that the whole of the enclofed fummit has been molt carefully cleared from itones, of which there is not one to be feen, unlefs thofe that form this divifion, and the fingle one in the midjle of the eircle of tumuli above mentioned. What has been the defign of this feparated face, it is dificult to eonjecture. It might perhaps have marked the ref:dence of thofe of a highor rank, or ferved as a temple for the purpofes of devotion." On the eaft el.d of the large area on the fummit is a weil of about fix feet in diameter, which has probably been funk very deep i: the rock, though now it is fillel up with rubbilh to witlin a yard of the top.

The ether fortitied hills *mentionel by Mr Cardonnel ase there of Dun- Evan in the fluse of Nain; Tus.

 fouth of Font Withem. Whe $!$ ah: hill of Finhaven, $\rightarrow$
 ruin of the farne diad.

Dun-ixan and the hill of Trhave: S.... he hesife been vinted by It Tytler, who sue an a rant of them in the parer already aotel; of whal the following is an abutrack. " On the fummit o: tio hiil of Dun-Evan, whole name implie that it kail keen originally a place of deicnce, are the remans of two walls furrounding an oblong frace ike that of Craig Phadrick alrealy deficribed, but fomewhat fmaller in fize. [Mr Cardonne] fars that it is about 70 paces long and 30 broad]. There are likewife the traces of a well in the enclufed area; and at the eath cond are the remains of a poodigious mafs of building, much more extenfive than that on Craig Phadrick." Here, however, our author could not perceive any marks of fire; and Mr Williams owns that the vituified ruins here are more waited than on Knocktarril or Craig Phadick. But with regard to the vitrifications here, our author is inclined to fuppole Mr Williams to bave been entirely in a millake. On the Caftle hill of Finhaven, however, the vituifed remans are very vifible all round the lummit, which is cleared of ftunes and lecelled, unlefs at one end, where there is a great hollow fpace feparated from the reft oi the area, and probably deninet exclunvely for the keeping of cattle. The encloled atea is about iq yards long, and upwards of 40 broad.

Befides there fortifications, the hill of Noth athores a remarkable appearance of the fame hind: of which Mr Cordiner gives the following defeription, not from his own obfervation, but thofe of a gentlemen of ciedit who vilited the place. " (n the top of the lill there is an oblong hollow, as I could guef, of alsut an Englifh acre, covered with a fine fivard of grats in the middle toward the ealt end of thi hollow is : large and deep well. The hollow is furrounded on all fides with a thick rampart of ilones. On three fidco of this rampart, from 8 to 12 feet thick, is one com. pact body of fones and minerals which have been in a ftate of funo:n, reimbling a mixture of hone and iron-ore, all vitrifed, calcined, and incorporated. On the north fide, the rampart conflls of broken pieces o: rock, which have the appearance of having been tom to pieces by fome extraordinary violence. If the calcined compact wall exifts under them, it is not at pre. fent vifible."

Such are the defcriptions of the moft remarkable of thele curious fortitications, which of late feem to have engnged the attention of the learmed in a confiderable degree. We have already taken notice, that by form they are fuppofed to be the works of art, by others the productions of a volcano. Mr Cardunncl adopts the opinion of NI Willmms as the moll probable, both with reffect to thair whe and mamer of conlluction. Mr Tytier takes notice of the remarkable difference of opinion ameng thofe who have viewed the places in queftion. " lt is curions to remark (hays he) how the fame appearances, to different obfenvers, lead to the moll oppofite opinions and eonclufions, The two gentlemen above mentioned ( ll . Williams and

Fitrificl e.t 'don'st, that the vitrified materials on the tons of Furt

 tur to the acrth of S athed, vitied tie hall of Craig
 it the mound o frite metter were not the rewouns of any ataticill whit, but the traces of an ancient wleano. In the l"nal Tranf, of the Roysl bucicty of London for 1-77, Part 11. N 20. is an accuant of $\dot{C r}_{\text {red }}$ Fctirick, the:e termed a l-kanic hill noar Ineron , m a letter from Thomas Wet, En. to Mr L.w. F.R.S. in which the writer does not hetitete to Nonounce this hill an extinguithed valcano; and having fent fipecimens of the burnt matter for the infpeciion of the Royal Society, the lecretary fuhjoins a note to the paper, intimating, that thele pipcomens having been examined by fome of the rembers well acquinted with volcanic productions, vere ly them judged to be real lasa. Such was likewic the opinion of the late Andrew Croblie, Efq. who, in an account which he gave to the Philolophical Society of Edinburgh in $1^{-2}$, of ofered fome very curious conjectures with regard to the procefo of nature, by which he fuppofei the whole of thi hill to have been thrown up from the butom of the fea by the oneration of intertine fire.

MI Tyster agrees with thofe who think the vitrified flructures to be artificial works: but he difies from Mr iVilitiams and others, who think that they were vitrified on purpoie for cementing the materials together. His reafon for this is, that the number of forts that thow marks of vitrification, is condiderable when compared with thole that do not. He therefore confiders the vitrification as accidental; and that it muil have been accomplined in the following manner. In the rude ftate in which we mult fuppele Scotland to have been in carly times, it is very probable that their buildings, both for habitation and defence, would be frequently conitructed of loofe dones of an irregular thape; of which, by themfelves, it would fasce be poffible to fabricate a wall of any tolerable ferength. Hence it became necelay to ufe trood as well as tone in their conlruction. This kind of building, then, in our aur thor's opivion, was begun by railing a double row of pratiades or frong lakes in the form of the intended firuedure, in the fome wa: as in that ancient mode of huilding devibed by Pailadio under the name of riempluta à caffa, or coffer-work. Thefe itales were proLably warped acrols by boughs of trees laid very clolely together, fo as to form two fences running parailal to each other at the diftance of fome fect, and to clole as to confinc all the materials of whatever lize that were thrown in between them. Into this inturnediate fpace $\operatorname{Mr}$ Tytler Suppofes were thrown boughs and trunks of trees, earth and ftones of all hizes, larke or fmall as they could quarry or collect them. Very ittle care would be necellary in the difpofition of thene materials, as the outward fence would keep the mound ia form. In this way it is ealy to conccive that a very flrong bulwark might be reared with great defpatch; which, joined to the natural advantage of a very inacceflible fituation, and that improved by artful contrivances for increafing the dificulty of accels, would form a ftruiture capable of anfwering every purpole of
fecurity or dutacs. The moft formidable attack a- Vitififa grinit if h a duicling would be fire, which would Forts. io doutt Ie airess attempted, and often with fuccers, by an eneray who indertook the fiege. If the beliegers prestiled in gaining an approach to the ramparts, and, furnowding the estertal wall, let fire to it in feveral Place, the cutincration malt feedily have become univertal, and the effect may be eably imagined. If there happened to be any wind at the time to increafe the heat, the ltony parts could not fail to come into ftuion: and as the wood burnt away, finking by their own waigit into a folid mafs, there would remain a wreck of vitrified matter tracking the f ,ot where the ancient rampert had tood; irregular, and of unequal heicht, from the fortuitous and unequal difribution of the fiony materials of which it had been compofed. This conjezture appears very probable from their appoatance at this day. They do not feem to have ever been much higher than they are at prefent, as the fragments that have fallen from them, even where the wall is lowch, are ver: inconfiderable. The durable nature of the materials would prevent them from fuffering any charges by time; though from the gradual increafe of the foil, they mult in fome places have loft connderably of their apparent height, and in others been quite covered. Mr Williams, in making a cut throngh the ramparts at Knockfarril, found in many places the vitrifed matter covered with peat mofs half a foot thick.

In confirmation of this opinion, our author likewife urges that in the fortification on Craig Phadrick, a large portion of the outward rampart bears no marks of vitrification. The reaton of this feems to be, that the fleepacts of the hill on that fide renders a low fence of tlones and turf fuficient ; and no rood had probably been employed in its contruction. "It appeiss therefore highly probable (conciudes our author), that the effect of fire upon thefe hill fortifications has been entirely accidental ; or to fpeak more properly, that fire has been employed not in the confrticition, but towards the demolition of fuch buildings: and for the litter purpofe it would certainly prove much more effic., cious than for the former. It is much to be doubted, whether it would be at all polible, even in the prefent day, by the utmoft combination of labour and of kiill, to furround a large fpace of ground with a double rampart of tlones compacted by firc, of fuch beight and folidity as to anfiver any purpofe of fecurity or defence againt an enemy. Any htructure of this kind mult liave heen iffegular, low, fragile, eafily fcaled, and quite infecure; a much weaker rampart, in fhort, than a Emple wall of turf or wooden pallifade. The ventiges yet remaining, as I have already obferved, give no room to fuppoie that the vitrified mound has ever been much more eatire than it is at prefent. The effect of firc upori ftrtetures reared in the manner I have fuppelid them to have been, will account mo!t perfectly for their prefent appearance. It was from necedlity that the builders of thele fortifications betook themielses to a node of thucure fo liable to be deflrosed by fire. In thofe parts where ftones could be eafily quarricd, of fuch fize and form as to rear a rampart by themelves of fublicient ftrength and folidity, there was no occafion to employ wood or turf in it; cosfluction; and it was therfure proof againt all of

## F O R

Fitrified faults by fire. Such are the ramparts which appear on Fort:, the hill of Dun-Jardel, Dun-Evan, and many others, on which there is not the frualleft appearance of vitrification. But on Craig Phadrick, and the other hills above defcribed, where, from the nature of the rock, the ftones could be procured only in irregular and generally finall fragments, it was necellary to employ fome fuch mode of conllruction as I have luppofed; and thefe rampaits, though folid and well calculated for defence againft every attack by force or itratagem, were not proof againgt an affault by fire."

Mr Cordiner is of opinion, that the vitrifications in queltion cannot have been the works of art, and ridicules the contrary hypothefis ; though without adducing any argument againt it. The Hill of Noth is by him fuppofed to have been a volcano. He defrribes it as " a moit majettic mountain, in general brown, with mols and heath, interiperfed with bare rock, in many places crumbling down. The higheft part of it is a circular hill, whofe verdure, as well as height, diftinguifhes it from the relt of the mountain. This is called the $T o p$ of $\mathrm{N}_{\mathrm{ot}}^{\mathrm{l}} \mathrm{l}$; and bears the trongeit refemblance to every defcription of a volcanic mount. At the diffance of many miles, one can diftinguih thofe ridges which are the buundaries of the crater, indicating the hollow in the top." The gentleman from whom Mr Cordiner received the account of the vitritications on the fummit, informs us, that on firit feeing fpecimens of them, he imagined that they had been pieces of thone calcined by the burning down of a calle; as he had found fomething very like them on the caitle-hill at Cullen, in parts where the fward of grafs was broken; but on reaching the top, and viewing the appearances on it already defcribed, he altered his opinion. "That men hardly befet (fays he) might climb up with fome provifions to this as a place of refuge, is probable: but that, on a barren mountain top, far from cultivated ground, half a day's journey from the plain; that there, in any puriod of fociety, man hhould have been tempted to build that amazing rampart, is not to be imagined: they lave found it a natural and extenfive fortref, and in critical circumftances have made ufe of it accordingly. That it has been occupied as a place of ftrength and of refuge, is very evident; for, fome hundred yards lower down on the hill, there are the remains of another rampart or wall, confiting of loofe itones piled together without any cement, carried quite round the hill. This lat has been built for an additional defence to thofe who nade their abode on the top. The top of Noth, for twothirds downward, is covered with a green feard; below that, it is brown with heath: this is the very re$v \in r i e$ of the adjacent mountains; and the greater verdure of the upper part I imputed to a new foil created by the athes of the sulcano. The opening, called a will, I fuppole to have been the latelt crater. About a mile fouth, down towards the lower grounds of the Cahrock, there is a very pretty regular green hill, which I afcribe to a later eruytion than thofe which may have formed the contiguous hills now covered with heath. There is an extraodinary luxuriant futing of water rulbes out at once from the fide of the hill of Noth; which is likewife fome comirmation of the opinion that a velcano has fome time caited there,
which has occafioned great hollows and referwoirs of Vierifici water in the heart of the mountain. And the wild ir- Forts. regularities of nature through all the Cabrock, the hideous and ilrange projection of rocks from the lides of the hills, would feem to indicate fome vall convulfions which the earth mult have fuffered in thele parts.
"The traces of ancient volcanoes (fays Mr Cordiner) are far from being unfrequent in Scotland. The hill of Finhaven is one inftance; and not only abundant in this fpecies of lava, but with tarras, or the pulvis puteolanus, an amalgama, as Condamine calls it, of calcined fones mixed with fcorias and iron ruft reduced to powder. The hill of Beregonium, near Dumtaffnage caftle, is another, yielding vait quantities of pumice or fcoria of different kinds; many of which are of the fame fpecies with thofe of the volcanic Iceland. The noble affemblage of balaltic columns at Staffe, thofe in the Ile of Sky, and the rock Humble, are but fo many evidences of the ancient volcanoes of this country. And finally, the immenfe ftratum of pumex vitreus or Iceland agate, on the hill of Dun-fuin in Arran, is the latt proof I thall bring in fupport of the queftion."

On this difpute we can only obferve, that whatever fide we embrace, the difficulties leem to be very great, nay almolt infurmountable. When we confider the great thicknefs of the walls on the top of Noth, from 8 to 12 feet, and the vall mound of vitrified matter, no leis than to feet in breadth, mentioned by Mr Tytler, we can farce conceive it polible that lefs than a volcaric fire could be able to form them. We may ealily allow, that, in the way this gentleman mentions, there might be confiderable vitrifications formed; but that fuch immenfe mafles thould be brought into perfect fufion by the imall quantity of fuel which could be put round them in palifades, or intermixed with the materials themelves, will be incredible to every one acquainted with the extrene difficulty with which flones of any magnitude are brought into complete fialion. We fee even in the indides of furnaces, though fometimes buit of no more infufible materials than common brick, no fuch effects follow. There is a ilight vitrification indeed, but it farcely ever penetrates to the depth of an inch or two, though very violent fires are kept up for a much lunger time than we could fuppofe the wood furrounding thofe walls to require for its being confumed. In conlagrations, where houfes are confumed, which are the only fimilar examples we have, no fuch effect is perceived. Even in the grent fire at London in 1666 , where fo many buildings were deilroyed, we do not hear of their wail? being vitrified, though the materials of many of them were undoubtedly as fufible as the rocks and tones of Craig Phadrick, or the Top of Nuth. If, on the other hand, we reject this, and adhere to the volcanic hypothedis, our dificulties are equally great. For where thall we find, in any other part of the world, an example of volcanose eicctiny lava in the form of walis enclofing a regular area? Inis would be attributing fuech a fiagulatity to the volcanoes of Scotland as the moft cstra:agant imagination cannot dmit. We mult thercfure conclude, that though thefe ruins are certainly the works of art, we have not yet fufficient data

inth n nea are ly guoch, Mr Tyene werve, that

 they have hees ratal." Tha, he iully doterves, mult have been betose the ne of mortar was 6anma for as the country aroonded in limetione, and the buildros cottaing would exert all their powers in giving them a proper derece of lirength, it would undoubted1y have been uled. Hence we are led to alcribe to thefe a very conderable segree of antiquity ; for as the Brtuon were tuaght the ule of mostar by the Ro. mans, it is probable that we mut date the origin of the itructures in queftion before the time ot the invafion of that people, or at leat foon after it; io that we muht look upon them to be more than 1650 years old; but how far beyend that period we are to fearch for their origin, does not appear. " All that we can conclude with certainty (fays our atithor) is, that they belong to a period of extreme barbaritm. They mult fave been conftucted by a people farcely removed from the itate of favages, who lived under no impreffon of fixed or regulated property in land; whofe only appropwisted goods were their cattle; and whofe fole fecurity, in a life of conitant depredation, was the retreat to the fummits of thofe hills of dificult accefs, which they had fortified in the beft manner they could. As the frace enclofed was incapable of containing a great number of men, efpecially if eccupied in part by tattle, it is prefumable, that thefe retreats were formed chiefly for the fecurity of the women and children of the canton, and of their herds. They could be decended by a few men, while the relt of the tribe were ergaged with their enemies in the field."

Our author concludes his differtation with a conjectare, that the fort in queition were conftructed, not only before the Roman invafion, but before the introduction of the rites of the Druids into Britain; as "there appears no probability that the inhabitants either lived under fuch a govermment as we know to have prebiled under the influence of the Druids, or had any acruaintance with thoie arts which it is certain they cultivated."

FORTALICE, in Scuts Law, fignifed anciently a finall place of Arength, originally built for the defence of the country ; and which on that account was formerly reckoned inter resalia, and did not go along with the lands upon which it was fituated without a fpecial grant from the crown. Now, fortalices are carried by a general grant of the lands; and the word is become fynonymous with manor $\mu$ lace, mefluage, \&ic.

FORTESCUE Sik Jons, lord chief juftice of the King's Bench, and lord high chancellor of England, i: the reign of King Menry VI. was defended from the atcient family of Forteloue, in the county of Dewor. He flucied the municopal laws of England in Liccola' 1 . of which be was made one 0 the goWmors it fourth med feventh years of the reign of Kitur He. VI. $h_{1}$, $2 \sigma$ ewas caliod to tle degoce कt indont at law, an: a $1+11$ was contituted the hing", liexcant. The follosing year he was made lord chini, thoe of the King." Berch; in which honowabie

flation $h$ : coutinted till near the end of that king's reigt, who howed him many particular marks of his fasuur, and advanced him to the poft of lord high ciancellor of England. During the reign of King Edward IV. he followed the fortunes of the houfe of Lancater, and wa; many wars in exile with Queen Nargaret and Prince Edward her ion. At length, they having a profpect of retricing their defperate fortuacs, the quaen and prince returned to England, and Sir John Fortetcue, with many others, accompanied them : but foon after the decinive battle of Tewkebury, 1 -e was thrown into prifon and attainted, with other Lancaftrians; but found means to procure his pardon from Edward IV. He wrote, 1. A learned commentary on the politic laws of England, for the ufe of Prince Edvard; to one edition of which Mr Selden wrote notes. 2. The difference between an abfolute and limited monarchy, as it more particularly regards the Englith conftitution (which was publighed, with fome remark;, by John Fortefcue, afterwards Lord Fortefcue, in 8vo, in $17^{1} 4$; and a fecond edition was publihed, with amendments, in 1719): And feveral works, which ftill remain in manufcript. He died neas 90 years of age; and was buried in the parifh church of Ebburton, where a monument was erected to his memory, in $167 \%$, by one of his defcendants.

FORTH, one of the noft noble and commodious rivers in Scotland. It takes its riie near the bottom of Ben-Lomond; and rumning from weft to eaft, receives in its paflage many confderable fireams, deriving their waters from the eminences in the midland counties of North Britain. Between Stirling and Alloa, the Fortn winds in a moft beautiful and furprifing manner ; to that, though it is but four miles by land, it is $2+$ by water between thofe two places. Below Alloa the river expands itlelf to a great breadth between the counties of Lothian and Fife, till at Queens-ferry it is contracted by promontorics thooting into it from both coaits; fo that, from being four or five, there it is not above two miles broad. In the middle of the channel lies a fimall illand called Inchgare\%, which has a fpring of frefly water: upon the niland there is an ancient fort, which has been lately repaired; and it there were either forts or bluckhoufes on the oppofite promontories, that part of the river which lies between Alloa and Guten's-ferry would be as fecure and convenient a harbour as could be defired. A little below this, near the north ihore, lies Inchcoim, on which are the remains of an ancient monaftery of confiderable extent; and oppofite to Leith itands the illand of Inchkeith, formerly fortified, but now in ruins. Below Queen's-ferry the north and fuuth hhores receding, the body of the water gradually enlarges till it becomes two or three leagues broad, affording feveral fafe harbours on both fides, and excellent roads throughout, unembarraffed with latent rocks, fhoals, or fands; and allowing fecuse anchorage to the largeit thips within a league of the coalt in almoit any part of the Frith, and to vefels of a fmaller fize within a mile or lefo. The Firth, or (as it is commonly written) the Frish, of Forth, is, at the mouth of it, from North Berwich to Fitenefs, full five leagues broad; having the little ithand of May (on which there is a lighthoute, and there might alfo be a fort) it the middle of it, and to the selt of this the rocky ithand of Bafs; notwith-

## $\mathrm{F} \quad \mathrm{O} \quad \mathrm{R}$

Forth. ftanding which, the largef fleet may entcr and fail up it many miles with the utmolt facility and in the greatett fafety. In ${ }_{7} 78 \mathrm{t}$, Admiral Parker's fleet lay fome weeks oppofite to Edinburgh, accompanied by 500 fail of merchantmen, the whole in full view of the city and caftle.

The Forth was known to the ancients by the name of Bodotria, or (as Ptolemy calls it Boderia, and has been ever famous for the number of its havens: fome of which are, indeed, in their prefent condition, fcarce worthy of that name. It is navigable for merchantmen as high as Alloa, 50 miles from the fea; and for coalters as far as Stirling, 24 miles further by water, though only four by land in a direct line, as already obferved. The tide flows only a full mile above Stirling to a place called Craigforth, where the proprietor intercepts the paffage of the falmon by a cruive or wear, very injurious to the large tract of country which itretches as far as Lomond weftward. The river from Stirling to the bridge of Aberfoil, at the entrance into the Weit Highlands, is only paffable for man or horle at few places, and thefe in dry feafons. It glides gently through a dead flat, from Gartmore ealtward; " and
they profecuted with great vigour as far as Icelani, till the time of the Union, from which period the eallern fiheries gradually dwindied away ; and the poor fifhermen, unable to fublitt themelves upon air and water, took up the trade of fimuggling ; but fo foon as the filhery laws fhall be amen!d, the falt dutien abolifhed, and an adequate bunty extended to boats as well as buffes, thefe poople will readily fall into the track of their anceltors, live by honelt indultry, and add new vigour to our naval itrength. Many of the ports are nearly choaked up, others want repairs, which neither the individuals nor the corporations of thofe decayed places can accomplifh. Though the harbours on the Forth are in general fmall, the depth of water might be made futficient for veffels of 20 j tons burden, which fully anfwers the purpofes of their coafting and Baltic trade ; but to obtain this, or even a lefs depth of water, an aid of 50,0001 . would be requifite."

By this river and the Clyde, Scotland is almont divided into two parts. The Forth falls into the eaft led below Edinburgh, and has an eafy communication with the whole eaitern coaft of Great Britain ; with France, Oitend, Holland, Hamburgh, Prulia, Dantzic, Ruilia, Sweden, Denmark, Norway, and Greenland. The Clyde falls into the Atlantic ocean below Glafgow, and communicates with the weftern coalt of Great Britain ; with Ireland, the fuuth of France, Portugal, Spain, the Mediterranean, America, and the Weit Indies. Thele two rivers, thus falling in oppofite directions into the two feas which environ our illand, and the neck of land between them amounting farcely to 27 miles, gave riie to the idea of a junction, fo as to open a communication acrofs the hingdom, and thereby cut oft the long dangerous narigation by the Land's End and the Pentland Frith : an object of vat utility, and which has been happily accomplithed. See Canil.

## FORTIFICATION;

THE art of rortifing a town, or cther p'..ce ; or of puting it in luch a pofture of defence, that every one of its parts defends, and is deterdad by, fome other parti, by means of ramparts, parare:moats, and other bulwarks; to the end that a mall numbe of nen within may be able to deiend themfelves for a confiderable time againt the allaults of a numerous army without, fo that the enemy in attack. ing them muft of necelfity fuffer great lofs.

The origin and rife of fortification is undoubtedly owing to the degeneracy of markind. In the filf ago of the world, men were diperfed up and doten ite conntries in feparate families, as we are told in the hiatories of the Jews and Scythians, who wandered frem one place to another, for the fake of finding pataure for their cattle. Thefe families became in tirse fo wumerous as to form large commurities, whelh fettled ail Towether in a place; from whence villages and $10:$ m had their origin and rife: but they fousd it wav necrilary, for the common fecurity, to furroma I thacis turns with walls and ditcice, to prevent all viotence: Vぃю. 1. 1.... 1 .
from their neigituars, and fudien iurprijes. This was fulicient for lome tinc, till oflenfive weapoas were invorted, and conquering became a fahion. Then walis with toop holes were made at proper diftances, in or dit to foreen the defenders aqainit the arrows of the af...lants: but finding that, as loon as the enemy got orice clufe to the wails, they could from no pirt be dilcovered or repuled; for this reafon thr added fquare towers at proper diftances from each other, fo that every part of the wall might be defended thy the adjacent fides of the tuwers. This manner of enclofing towns, however, was found to be imperfect, becaule there remaiard thill one of the faces of the towers which fronted the fic? that could not be feen from ang other point, and therefore could not be defended. To remedy this, they made the towers round initead of ipuate, buagining this figure to be the ftrongeit to reCit the taterins engines, as likewife to be better defended from the other farts of the wall.

Nuwhhianding the fuperiority of this method :buve the furbaet, there remained vet a part of the ic

[^0]the mean in that of all forts of towns, and the great in paticular cafos only.
-mimn'

## Metb d

 made thom chance the fizure of the towers ayaiv; that is, they made them finare as before ; but, intead of prelenting a face to the field as formerly, they prefented an angle ; by this means they eftectually found out hich a diponition of their works that no part could Le attacked without being feen or defended by fome other part.This late method was in ufe a long while; and would in all probability have continued to this day, if gunpowder had not been found out; but the wiolence of the guns and mortars foon convinced the world, that fuch towers and walls were but a weak defence againtt thefe thundering engines; and befides, as the nature of the attack was entirely changed, it was alfo neceffary to chance that of fortilying, likewife.

From that time ramparts were added to the walls, the towers enlarged into baftions, and all forts of outworks have been added, fuch as ravelins, counterguards, horn and crown worhs, and others of the like nature, in order to render the defence in fome meafure equivlent to the tack.

Notwithitanding all the improvements which have been made in the art of fortifying fince the invention of gunpowder, that of attacking is till fuperior to it ; engineers have tried in vain to render the advantages of a fortication equal to thofe of the attack; the fuperionity of the befiegers fire, together with the greater rumber of men, obliges generally, fooner or later, the beficged to fubmit.

The greatelt improvement made in the att of attacking happened in the year 1697, when M. Vauban made nirlt ufe of ricochet firing at the fiege of Ath, whereby the befleged placed bchind the parapets were as much expofed to the firc of the befiegers as if there had been none; whereas, before, they had been fecure as long as the parapet was not demolified ; and the worlt is, that there can be no remedy found to prevent this enfilading, withost falling into inconveniences almoll as bad as thofe which we endeavour to avoid.

Formificatios is either regular or irregular. Regu/ar fortification, is that built in a regular polygon, the fides and angles of which are all equal, being commonly about a muket thot from each other. Irregular fortitication, on the contrary, is that where the fides and angles are not uniform, equidifant, or equal ; which is oxing to a he irregularity of the ground, valleys, rivers, hills, and the like.

## Srct. I. Of Regular Fortifuaticn.

Abruouchi authors agree as to the general form in the prefent manner of fortifying, yet they moftly difier in particular conftruclions of the parts. As it would be both needlefs and fuperfleous to treat of all the different methols hitherto propofed, we thall content ourfelves with explaining thofe only which are moft efteemed by the beit judges, and have been moflly put in practice.

## Confruction of M. Vavban's Method.

This met?od ic divided into little, mean, and great; the litt/e is chictly ufed in the conftruction of citadels,

We flall give the conitruction of the mean, as being mott ufeful; and refer the reader to the table hereaf. ter, for thote dimenfions which are different in thefe feveral fortifications.

Intcribe in a circle a polygon of as many fides as the fortification is deligned to have fronts; let $A B$ (fig. 1.) be one of the fides of half an hexagon, which bifect by the perpendicular CD ; divide half AC of it into nine equal parts, and one of thefe into ten others; then thefe divitions will ferve as a fcale to contruat all the parts of the fortification, and early of them is fuppofed to be a toife or fathom, that is, fix French feet; and therefore the whole fide AB is fuppoted to be $180^{\circ}$ toifes.

As the dividing a line into fo many equal parts is troublefome and tedious, it is more convenient to have a fcale of equal parts by which the works may be confructed.

If therefore, in this cafe, the radius is taken equal to 180 toifes, and the circle defcribed with that radius being divided into fix equal parts, or the radius being carried fix times round, you will have a hexagon infcribed; AB being bilected by the perpendicular CD as before, fet off 30 toifes from C to D, and draw the indefinite lines $\mathrm{ADG}, \mathrm{BDF}$; in which take the parts $\mathrm{AE}, \mathrm{BH}$, each equal to 50 toifes: from the centre E defcribe an arc through the point H , meeting $A D$ in $G$, and from the centre $H$ defcribe an arc through the point E , meeting BD in F ; or which is the fame, make each of the lines EG, HF, equal to the diftance EH; then the lines joining the points A, E, F, G, H, B, will be the principal or outline of the front.

If the fame conftruction be performed on the other fides of the polygon, you will have the principal or outline of the whole fortification.

If, with a radius of 20 toifes, there be defcribed circular arcs, from the angular points $\mathrm{B}, \mathrm{A}, \mathrm{M}, \mathrm{T}$, and lines are drawn from the oppofite angles, $\mathrm{E}, \mathrm{H}$, \&ic. fo as to touch thele arcs, their parts, $a b, b c$, \&c. together with thefe arcs, will reprefent the outline of the ditch.

## Definitions.

1. The part FEALN, is called the baltion.
2. AE, AL, the faccs of the battion.
3. EF, LN, the flanks.
4. FG, the curtain.
5. FN, the gorge of the baftion.
6. $\mathrm{AG}, \mathrm{BF}$, the lines of defence.
7. AB, the exterior fide of the polygon.
8. CD, the perpendicular.
9. Auy line which divides a work into two equal parts, is called the capital of that work.
10. $a b c$, the comnterfcarp of the ditch.
i1. A, M, the flanked angles.
11. H, E, L, the angles of the fhoulder, or fhoulder only.
12. G, F, N, the angles of the flank.
13. Any angle whofe point turns from the place is called a falient angle, fuch as $A, \mathbf{M}$; and any angle
oi whofe point turns toward, the place, a reenterge as, $A$,
14. If there be dawn two lines paralle! to the primcipal or out line, the one at 3 toifes dintance, and the other at 8 from it ; then the face $4 v$ inchuled betwen the principal one and that firthat dilant, is callod the rampar:-

And the fpace $x x$, contained by the principal line, and that near to it, and which is generally itained black, is called the parapet.
16. There is a fine line drawn within foar fect of the parapet, which expreifes a ttep called bangiatte.
N. B. All works have a parapet of three toifes thick, and a rampart of 8 to 12 , befides their llopes. The rampart is elevated more or lefs above the level of the place from 10 to 20 feet, according to the na-
 (1) inetr.
 6 to 7 fat abo:e the reth, in order cover the troop c.essi. which are dram up thene itan tion for ene the cheny in
 than the ramon, of aimat four bict iomer than the parapet fo that whan ter tonup fand ufun it they may juit be able to fire over the prapuet.
17. The iody of the place, is all that which is contained within this inrt rampart: for which reafon, it is often faid to conniruct the brody of the place; which means properil, the contruction of the baitions and curtains.

I 8 . All the works which are confructed beyond the ditch before the body of the place are called ourwork.

TABLE.

|  | Fiti) |  |  |  |  |  | Litel Fortis. |  |  |  | Man |  | Great. |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Side of Polyg. | 80 | 90 | 100] | 12 | 120 | 130 | 140 | 150 | 160 | 178 | 180 | 190 | 200 | 260 |
| Perpendicul. | 10 | 1 | $12{ }^{\frac{1}{2}}$ | $1+$ | ${ }^{15}$ | 16 | 20 | 21 | 23 | 25 | 35 | 31 | 25 | 22 |
| Faces bait. | 22 | 25 | 28 | 32 | 33 | 35 | 40 | 42 | 45 | 47 | 50 | 53 | 55 | 60 |
| Cape of ravel. | 25 | 28 | 301 | 35 | 38 | 42 | 54 | 501 | 50 | \| 521 | 5.1 | 55 | 60 | 50 |

In the firt vertical column are the numbers expreffing the lengths of the exterior fides from 80 to 260 . In the fecond, the perpendiculars anfwering to thefe fides. In the third, the lengths of the faces of baftions: and in the fourth, the length of the capitals of the ravelins.

The forts are moftly, if not always, fquares: for which reafon, the perpendiculars are made one-eighth of the exterior fides; becaufe if they were more, the gorges of the baftions would become too narrons:

The little fortification is chielly defigned for citadels, and are commonly pentagons; the perpendiculars are made one-feventh of the exterior fide: the mean is ufed in all kinds of fortifications from an bexagon upwards to any number of fides; and the great is feldom ufed but in an irregular fortification, where there are Come fides that cannot be made lefs without much expence or in a town which lies near a great river, where the fide next the river is made from 200 to 260 toifes; and as that fide is lefs expofed to be attacked than any other, the perpendicular is made fhorter, which faves much expence.

The faces of the baitions are all ${ }^{3}$ ths of the exterior fides, or nearly fo, becaufe the fractions are neglected.

It may be obferved in general, that in all fquares the perpendicular is th of the exterior fide, and all pentagons ith, and in all the reft upward 'th.

## 1. Confruftion of Orillons and retired Flanks.

Defribe the front MPQRST as before, and divide the flank into three equal parts, of which fuppofe $S r$ to be one : from the oppofite flanked angle II draw a line $11 r$, in which take the part $m r$ of 5 trifes; take likewife $\mathrm{R} n$ in the line of defence MR, produced, equal to 5 toifes, and join $n m$, upon which as a bafe defcribe the equilateral triangle $n f^{n} n$, and front the
angle $p$, oppofite to the bafe as centre, is defcribed the circular flank $n m$.

Andif $\mathrm{S} r$ be bilected by the perpendicular $\mathbf{1}, 2$, and another be erected upon the face 51 , at $S$; the interfection 2 of thefe tivo perpendiculars will be the centre of the arc which forms the orillon.

The crillons ate very ufeful in covering the retired flanks, which cannot be feen but direitly in the front ; and as thefe orillons are round, they cannot be fo eafily delfroyed as they would be if they were of any othe: figure.
2. Confruation of Raveline or Half moons.

Fig. 2. Set off 55 toifes, from the re-entering angle $O$ of the counterfcarp, on the capital OL or on the perpendicular produred, and from the point $L$ draw lines to the Goullers AB; whofe parts LM, LN, terminated by the counturicarp, will be the face, and MO, ON, the femi-gorges, of the ravelin required.
This is M. Vauban's method of conftructing ravelins, according to fome authors: and others will have the faces of the ravelin to terminate on thote of the battions within 3 toifes of the floulders; which feems to be the beft way, for thefe ravelins cover the Hlauhs much better than the others.

The ditch before the ravelin is 12 toifes, its counterfcarp parallel to the faces of the ravelins; and is made in a circular are, before the falient angle; as likewife all ditches are in gencral.

When the ravelins are made with tlarks, as in fir. 3 . the faces flould terminate on thofe of the bations, at leatt 5 tififes from the thoulders.

The danks are made by fetting off 10 toifes from the extremities of the face, from $f$ to $h$, and from $n$ to $/$; and from the points $h, l$, the flanks $h, l, l, p$, are drawn paraliel to the capital LO of the savelin.

$$
\text { 1) } 2
$$

There

The re are ionctime redubes made in the ravein, fuels as in fig. 2. which is done by fetting off 16 toifes from the canemities of the faces on the lemi-gorges from N to $t$, and from M to $a$; and from the points $b$, a, the faces are crawn parallel to thofe of the ravelin; the ditch before the redoubt is 6 toifes, and its countericarp parallel to the faces.

## 3. Coffucticn of Tenailles.

A t:naille is a work made in the ditch before the curtains, the parapet of which is only 2 or 3 feet haler than the level ground of the ravelin. There are three diriment furts: the firfl are thofe as in fig. 4 . whin hare made in the dizection of the lines of defence, leaving a prafige of 3 toifes between their extremities and the tianks of the bations, as likewife another of 2 in the rididic for a briige of communication to the raselia.

The fecond fort are thofe as in fig. 5. Their faces are in the lines of defence, and 16 toifes long, befides the paflage of 3 toifes between them and the flanks of the bations; their nanks are found by defcribing wacs from one houlder of the tenaile as centre through the other, on whichate ict off 10 thies for the iamhs Cericd.

And the third fort are thofe as in fig. 6. Their faces are 16 toiles, as in the fecond fort, and the thanks are pazallel to thofe of the bations.

The wie in general of tenailles is to defend the bottom of the ditch by a grazing fire, as likewife the level ground of the ravelin, and efpecially the ditch before the redoubt within the ravelin, which can be defended from nowhere elfe fo well as from them.

The firft fort do not defend the ditch fo well as the nothers, as being too oblique a defence ; but as they are not fubject to be enfladed, M. Vauban has generally proferred them in the fortifying of places, as may be feen in the citadsl of Lille, at Landau, New Brifac, and in a great many other places.

The ficond fort defend the ditch much better than the firft, and ado a low flank to thofe of the baftion: but as thefe flanks are liable to be enfladed, they have itut been much put in practice. This defect might however be remedied, by making them fo as to be covered by the extremities of the parapets of the oppofite ravelins, or by forse other work.

As to the third fort, they have the fame advani...ge as the fecor:3, and are likewife liable to the fame Clijections; for which reafon, they may be ufed with the fame precautions which have been mentioned in the tecond.

Tenailles are fitcemed fo neceffary, that there is hardly any flace fortitied without them: and it is not ithout reafon. For when the ditch is dry, the part behisd the tenailles ferves as a place of arms, from which the troops may fally, deltroy the works of the enemy in the ditch, oppole their defeent, and retire with fafty; and the communication from the body of the flace to the ravelin becomes eafy and fecure: which is a greit advantage ; for by that nieans the raelin may be a much better defence, as it can be fupplied with troops and neceffaries at any time. And if the ditch is wet, they ferve as harbours for boats, which way carry out armed mest to criofe the paf-
fage over the ditch whenever they pleaie; and the communication from the tenailies to the ravelin beconies likewile much eafier than it would be without them.

## 4. Confruction of Lunettes.

Fig. 7. Lunettes are placed on both fides of the ravelin, fuch as $B$, to increafe the ftrength of a place: they are conftructed, by bifecting the faces of the ravelin with the perpendicular LN; on which is fet off 30 toifes from the counterfearp of the ditch, for one of its faces; the other face, PN, is found by naking the femi-gorge TP of 25 toifes; the ditch before the lunettes is 12 toifes, the parapet 3 , and the rampart 8 , as in the ravelin.

There is fometimes another work niade to cover the falient angle of the ravelin, fuch as A, called botre; whofe faces are parallel to thofe of the ravelin, and when produced bilect thole of the lunettes; the ditch before it is 10 toifes.

There are likewife lunettes, fuch as D in f.g. 8. whofe faces are drawn perpendicular to thofe of the ravelin, within a third part from the falient angle; and their femi-gorges are only 20 toifes.

Thefe kinds of works may make a good defence, and coft no very great expence; for as they are fo near the ravelin, the communication with it is very eafy, and one cannot well be maintained till they are all three taken.

## 5. Confruction of Tenaillons.

Fig. 9. Produce the faces of the ravelin beyond the counterfcarp of the ditch, at a diftance MN of 30 toifes, and take on the counterfcarp of the great ditch 15 toifes from the re-entering angle $p$ to $q$, and draw N $q$; then $q$ NM $p$ will be the tenailles required; its ditch is 12 toifes, that is, the fame as that of the ravelin. Sometimes there is made a retired battery in the front of the tenaillons, as in B; this battery is 10 toifes from the front to which it is parallel, and 15 toifes long.

There are commonly retrenchments made in the tenaillons, fuch as O ; their parapets are parallel to the fronts MN, and bifect the fide $q \mathbf{N}$; the ditch before this retrenchment is 3 toifes; and there is a banquette before the parapet next to the ditch of about 8 feet, called berm; which ferves to prevent the earth of the parapet (which feldom has any revetment) from falling into the ditch.

It is to be obferved, that the ravelin, before which tenaillons are conftructed, mult have its falient angles much greater than the former confruction makes them; otherwife the falient angles of the tenaillons become too acute; for which reafon we made the capital of this ravelin 45 toifes, and the faces terminate within 3 toifes of the houlders.

## 6. Conforuction of Counterguards.

Fig. 10, II. When the counterguard is placea before the ravelin, fet off 40 toifes on the capita! of the ravelin from the falient angle $A$ to the falic... .n le le $\mathbb{K}$, of the counterguard; and 10 from $C$ to 1 , on the ceunterfarp of the ditch.

Wken the counterguard is befure the bafion, fuch as

## Sect 1.

FORTIFICATIOX
of in fus 2 . :t athent angle $\vec{F}$ is 50 toiles from the fuHornw rk. lient angie E of the battion, and the drtadth near the \&c. Citch of the ras clin 10 : vitís as betore.
Plare The ditch before the counterguards is 12 toifes, and Ccxai it counterfcarp parallel to the faces.

Counterguard are macle before the ravelin on fome particular occalion only ; but :re frequently conflructed before the bations, is cosering the flanks wonderfully well. Some authors, as Mr Blondel and Mr Cothorn, will have thew netch narrower than they are bere.
7. Confluition of Huthzorks.

Fig. 12. Produce the capital of the ravelin be pond the folient at le $A$, at a diflance $A B$ of about So tuifes; draw DBE at right angles to AB ; in which tike BD, BE, each equal to 55 toiles; and on the exterior fide LE , trace a front of a polygon in the fame namerer as that of the body of the place. making the perpendicular EF 12 tuife, and the faces 3 .

The branches $\mathrm{D} a$, L. ${ }^{\text {, }}$, of the hermwork, when produced, tuminate on the faces of the Ention, within 5 tuilis of the flonulder: The dith of the hornwoik is 12 toiles, and its counterfarp partliel to the branches; and in the front icminates at the thoulders, in the fame manner as the great ditel belore the haftions.

The capital of the ravelin before the front of the homwork is 35 toifes, and the faces terminate on the thoulders, or rather 2 or 3 tolies beyond them: and the ditch before the ravelin is 8 toifes.

There are fometimes retrenchments made within the homwork, fuch as $\mathrm{S}, \mathrm{S}$; which are conftruited by erecting perpendiculars to the faces of the ravelins, within 25 toifes of their extremities. This retrenchment, like all others, has a parapet turfed only with a berm of 8 feet before it; as likewife a ditch from 3 to 5 toiles broad.

Fig. 13. When a hornwork is made before the baition, the diftance DL of the front from the falient angle of the bation is 100 toifes, and the branches terminate on the faces of the adjarent ravelins within 5 toifes from their extremities; all the rat is dele fame 4: before.
8. Confrution of Crosonwork.

From the falient angle, A (fig. I4.) of the ravelin, an a centre, defcribe an arc of a cincle with a radius of about 120 toifes, cutting the capital of the ravelin froduced at C ; from the point C , fet off the cords CB, CF, each of them equal, 110 toifes; and on ench of which, as an cxterior fide, conltruct a front of ? pulygon of the fame dimenfors as in the hornsork; -hat is, the perpendicular hould be is toifes, the faces $\{$, and the branches terminate on the faces of the baAions within 25 toifes of the houlders.

The ditch is 12 toifes, the capital of the ravelin 35 , and its ditch 8; that is, the fame as in the horn"ork.

Sometimes the cromnwork is made before the barion, as in fige 15 . The arc is defcribed from the lalient ancrle $A$ of the baltion, with a radius of 120 toife, is before ; and the branches terminate on the face of the adjacent ravelins within $2 j$ toifes of then entromi-
ties; the ret of the dhamen ar. 1 contrations are the fame i. Werion
 but when a large frat of ground tatis beyoul the forti- Pive fication, which min lit be iddwatageous to an enemy ccaxn in a liege, or to crier tome gute ur entrance inta a town.

## 9. ConfruGion of Cownays and Glucir.

Although we have not litherto mentioned the co-vert-way, nevertheids all fortifications whatfeever have one; for they are efteemed to be one of the molt eflintial parts of a modern fortificstion; and it is certain, the taking the covert-way, when it is in a good condition and well defended, is generally the moof bloody action of the fieg .

After having conitructed the boly of the place, and a.l the ontworks which are tlinight neceflary, lines are draw: p..:alled to the outmuft counterfarp of the ditches, at 6 thiles difant from it; and the face $m n, m n$, inchuded betwein that line and the cuuntericarp, will be the covert way requined.
F.5. 15. There is in every re-enteriag angle of the counte foup a place of amms $m$; which is tound by let. ting off 2 : thite from the re-entering angle $a$, on both fide, irom $a$ to $b$, and from $a$ to $c$; and from the points $b, c$, as centres, arcs are defctibed with a radi..s of 25 tuida, io as to intertoct each other in $d^{\prime}$; then the lines drawn from this interfection to the puints $b, c$, vill $b e$ the faces of the places of arms.

If lines are drawn par allel to the lines which terminate the corert-way, and the places of arms, at 2 . toifes diftant from them, the fpace $x, x, x$, between thete lines and thole which termisate the coveri-way will be the glacis.

At the extremities of the places of arme, are traverfes made fuch as $: \quad$, , which firve to enclufe them; thefe traverles are 3 tuiles thicin, ont as lone as the covertway is broad; and a pariage is cut in the glacis round them, of about 6 or 8 feet, in orde: to hive a free communication with the relt of the covert-way.

There are alfo traverfes of the fame dimenfons before every falient angle of the balion and outworks, and are in the fome cire tion as the faces of thole works produced; and the thicknels lies at the fame fide as the parapets.

The paffages round thefe laf traverfes are likewile from 6 to 8 feet wide.

In each place of amas are two fally pors $\approx \approx$, which are 10 or 12 fect wide, for the troops to fally out; in time of a fegeg they are thut up with bariore of grics.

> 1o. Conltuquion of A rowe and D: achich Ren' ni'

An errow is a wosk made befor the tillene and of the glaci, furh as 1 , fie. 16 . 1t iv computai $\because$
 before it 5 toiles, terminatiag in a limpe at botn c.o. The communic.iton form the cover :iay ivt, , atrons is 4 or 5 tomen lide ; and these is atranie, or

ground whicin night be advaitageous to the befiegers; illewife to oblige the enemy to open their trenches farther (flit than they would do otherwile.

Therr ditance from the cowrt-way ought not to evceed 122 toifes, that it nay be difinded by nufket dhut from thence.

The gorge $a b$ is $q$ twifes; the flanks $a c$, $b, f$, which are perpendicular to the gorge, 10 ; and the faces $c d$, $f d, 30$ : the ditch before it is 6 toifes, ending in flopes at both ends; the covert-way + ; the branches of the cover:-way are 42 toifes long, or thereabouts; the faces of the places of arns $y, y$, which are perpendicular to the branches, 10 ; and the other, which is paralLel to them, 14.

The commenication from the covert-way into the reloubt, is 5 or 6 toife wide; and there is a traverie made juit at the entrance, and another in the middle when it is pretty long. The parapets of this communication terminate in a flope or glacis.

If thefe redoubts are above 50 toifes diflant from the covert-way, the beliegers carry their trenches round, and enter through the gorge; by which the troops that are in them are made prifoners of war, if they do not retire betimes; to prevent which, fome other outworks ihould be made to fupport them.

## 11. Confru7ion of Second Ditches and Covert-ways.

Fig. 17. When the ground is low, and water to be found, there is often a ditch about 10 or 12 toifes made round the glacis; and oppofite to the places of arms are conffructed lunettes, beyond the ditch: fuch as D , whofe breadth on the counterfcarp of the ditch is 10 toifes, from $b$ to $a$, and from $c$ to $d$; and the faces $a \mathrm{~L}, d \mathrm{~L}$, are parallel to thofe of the places of arms; the ditch before them is from 8 to 10 toifes wide.

The fecond covert-way is 4 toifec, the femi-gorges of the places of arms, $m$, about 15 , and the faces perpendicular to the counterfarp; the fecond glacis is from 15 to 18 toifes broad.

This fecond cosert-way has traverfes everywhere, in the fame manner as the firit.

> 12. Confruction of Profles.

A profile is the reprefentation of a vertical fection of a work; it ferves to fhow thofe dimenfions which cannot be reprefented in plans, and is necellary in the building of a fortification. Profiles are generally conilructed upon a fcale of 30 feet to an inch. It would be endlefs to defcribe all their particular dimenfions; we fhall therefore lay down the principal rules only, given by M. Vauban, on this fubject.

1. Every work ought to be at leaft $6^{\circ}$ feet higher than that before it, fo that it may command thofe before it : that is, that the garrion may fire from all the works at the fame time, with great and fmall arms, at the befiegers in their approaches. Notwithttanding this fpecious pretence, there are feveral authors who object againd it. For, fay they, if you can difcover the enemy from all the works, they can difcover, by the fame reafon, all the works from their batteries; fo that they may deftroy them without being obliged to change their fituation, and thereby difmount all the guns of the place before they come near it.

But if all the works were of the fame height, thofe
within cannot be deftroyed, till fuch time as thofe before them are taken: guns might be placed in the co-vert-way and outworks to obftruct the enemy's approach; and when they come vear the place, they might be tramported into the inner worls: and as the body of the place would be ruach lower, the expence would be conlidenably diminitied.

But when works are low, they are eafly enfiladed by the ricochet batieries, which is a kind of firing with a fuall quantity of powder, by giving the gun an elevation of 10 or 12 degrees: this might however be partly prevented, by making the parapets near the falient angles, for the fpace of 8 toifes on each lide, 5 or 6 feet higher than the rell of the works.
2. The covert-way fhould be lower than the level ground, otherwife the body of the place mult be raifed very bigh, efpecially where there are feveral outworks: this is to be underitood only when the works exceed each other in height, otherwife it need not be below the level.
3. The bafes of all inward flopes of earth fhould be at leall equal to the height, if not more.
4. The bafes of all outward ilopes of eaith, twothirds of their heights.
5. The flopes of all walls, or revetments, fhould be one-fith of their height; or one-fixth might perhaps be fufficient: the height of a wall is eftimated from the bottom of the ditch, and not from the beginning of its foundation.
6. The ilopes of all parapets and traverfes are onefixth of their breadth; that is, 3 feet towards the field; or the infide, where the banquettes thould be 3 feet higher than the outfide.
7. When the revetment of a rampart goes quite up to the top, 4 feet of the upper part is a vertical wall of 3 feet thick, with a fquare flone at the top of it projecting 6 inches; and a circular one below, or where the flope begins, of 8 or 10 inches diameter: they go quite round the rampart, and the circular projection is called the cordon.

Where the flraight part of the wall ends and the dope begins, the wall is always made 5 feet thick; and the counterforts or buttrefles reach no higher than that place.
8. When the rampart is partly walled and partly turfed, then one-fifth of the height which is turfed mult be added to 5 feet, to get the thicknefs of the wall above.

And having the thicknefs of any wall above, by adding one-fifth of its height from the bottom of the ditch, the fum will be the thicknefs of the wall at the bottom ; but if a fixth part is only taken for the flope, then a fixth part muit be added.

For inflance, fuppole a rampart of 30 feet high from the bottom of the ditch, and that 10 of which are to be turfed; then the lifth part of 10 , which is 2 , added to 5 , gives 7 for the wall above; and as this wall is 20 feet hish, the fifth of which is 4 , and 4 added to the thickneis 7 above, gives 11 for the thicknefs near the foundation.

Fig. 18. Reprefents (in military perfective) the profiles of the body of a place, the tavelin, and covert-way; ccxxirn. which gives a clear idea of what is meant by a profile, and from which thofe of all other works may be eafily conceived. The mont effential priaciple in fortification confifs Pate in making all the fronts of a place efually ftrong, to CCXXIII that the enemy may fond no advantage in attacking either of the fides. Ihis can happen no otherwife in a regular forti.ication lituated in a plain or even ground: but as there are but few places whi hare not irregular either in their works or lituations, and the nature of the ground may be fuch as makes it impracticable to build them regular without too great expence; it is lo much the more necelfary to fhow in what contills the itrength or weaknefs of a town irregularly fortified, io that the weakeit part may be made Atronger by additional outworks; as likewife, if fuch a place is to be attacked, to know which is the flrongelt or wrakeit part.

## 1. Confrution of an Irregular Place.fituated in an open cuntry.

It the place to be fortified is an old town enclofed by a wall or rampart, as it molt frequently happens, the engineer is to coaffider well all the diferent circumstances of the figure, fituation, and nature of the ground; and to regulate his plan accordingly, fo as to avoid the difadvantages, and gain all the advantages polible: he thould examine, whether by cutting off fome parts of the old wall or rampart, and taking in fome ground, the place can be reduced into a regular figure, or nearly $f_{0}$; for if that can be done without increafing the expence confiderably, it thould by no means be omitted. Old towns have often towers placed from diftance to diftance, as Douay, Tournay, and many other places, which are generally made ufe of, and mended when it may be done. If there is a rampart without baftions or towers, it mult be well confidered whether baftions may not be added, or if it is not better to make only fome outworks: if the ditch about this rampart is not too wide and deep, it would be advantageous to make detached baftions; otherwife ravelins and counterguards mutt be conftrueted. Special care mult be taken to make all the fides of the polygon as nearly equal as polibie, and that the length of the lines of defence do not exceed the reach of muiket-hiot; but if that cannot be done, thofe lides which are on the narrowelt part fhould be made the longefl.

If it fhould happen that forme of the fides are inaccelfible or of very dificult approach, either on account of fome precipice, marhy ground, or inundation, they may be made much longer than the oihers which are of eafy accefs, and the flanks need not be fo large as the reft; by doing fo, there will be fome expences faved, which may be ufed in making the other tides flronger by adding more outworks.

There are few fituations but what are more advantageous in fome parts than in others; it is therefore the bufinefs of an engineer to difinguih them, and to render thofe fides fliong by art which are .oot fo by nature.

If the fituation is low and watery, lunctes or tenaillone, and fuch other fmall outwork, hand be contructed ; becaufe they are not of any ereat expence, and may make a very good defence. But if une lide of the place only is low, and rumsing water is to bo hat, a is.
cond ditch and covert-way with hunettes may be made. by obferving, that if the firit glacis is made to llope, $f 0$ as to become even with the level of the water in the fecond ditch; or if the water can be fwelled by means of dihes or iluices, fo as to overtlow the belt part of the firit glaci, it thould be donc: for by fo doing cclate thefe works will be able to make a very grod defence, fince the befiegers will find it a diflicult matter to lodge themfelves upon this glacis; which camot be done but within a few toifes of the firlt covert-way, where the befieged are ready to receive them, and to dellroy their works with great advantage ; whereas the encmy cannot fupport their workmen but from the fecond covertway, which is too far off to be of any great fervice to them.

But if the fituation is of a dry nature, without any water upon it, caponiers flould be made in the great ditch, from the curtains to the ravelin, and batteries raifed in the entrance of the ditch before the ravelin, whofe parapet muth flope off into a glacis fo as to afford no cover for the enemy behind them. Arrows and detached redoubts are lil.ewife very proper to be ufed in fuch a cafe; and fometimes horn or crownworks, if it hould be thought convenient: but thele worh thould never be conitructed without an abfolute neceffity, either to oceupy a fpot of ground which might be advantageous to the enemy, or to cover fome gate or entrance into the town ; for they are of great expenee, and their defence feems not to be aadwerable to it.
Mof of the places in Flanders are fortified with hornworks, fuch as Ypres, Tournay, Lille, and others.

If the place to be fortified is new, and the fituation will not admit of a regular contruction, particular care mult be taken in choofing fuch a foot of ground as is moft advantageous, and leall liable to any diladvantaves cither in the building of in the maintaining of it. All hills or rifing grounds thould be avoided, which might command any part of the works; marthy grounds, becaufe fuch fituations are unwholefome; or lakes and fanding waters for the fame reafon, eacopting a lake is or may be made navigable. Good water thould be had either within the place or near it, for it is abolutely necellary for men and cattle : the sir thould be wholefome; otherwife the continual ficknefs that may reign in fuch a place might prevent people to come and live in it, and the garrifon would not be in a condition todefend themfelves as they ought to do. In thort, all the difierent circumfances attending fuch an undertaking thould be maturcly conidered before a rcfolution is taken to fortify any place.

When a fituation is fixed upon, the nest thing to be confidered is, the bignefs of the town and the number of its outwork; which watk atfolutely depend upon the conequence fuch a place is of to at nation. If it is only to guard a $\mathrm{pa}^{\text {'s }}$ or entrance into a country, it need not be fo large: but it it is to be a phe evther to promote or to protect trade, is hould be laree and commodious ; the flreets hondlla wid., and the buldens receular and convenient. A to fiat regards the fortification, its condraction dhowd depend on the nature of the fituation, an! the num or of works, on the funds or eapence a prince or a mation will be at; whach, honetice, ought to be according to the benctit ariing
f:om tull a place; for as fuch undertakings are of very great cypence, an engineer cannot be too lparing in his works; on the contrary, the greatelt econony thould be ufed both in regard to the number of works and to their contruction. The body of the place may have ( 1 ) revetments quite up to the top, or only in part and the relt turfed; but as to the outworks, they thould have half revetments, or they may be made with turf only; as being not fo neceflary to prevent the place from being furprifed, which may neverthelefs make a good defence.

Fig. 19. is the plan of an ochagon, one half of which is fimilar and equal to the other half; it being fuppofed, that the fituation would not admit of fortification quite regular. The exterior fides are each 180 toifes, and the works are conftructed according to our method: but becaufe the fides AB, EF, are weaker than the reft, as has been proved before, we have added terailles, rodoubts in the ravelins, and lunettes, to render them nearly equal in flrength with the others; and if counterguards were made before the baftions A and $B$, it would effectually fecure that front. Inftead of Inettes, any other works m.:y be made, as may be thought convenient and according to the nature of the \&round. If it hhould be judged neceffary to add other outworks to the ravelins all around the place, care mult be taken to add likewife more to the fronts AB, FF, in order to render the advantages and difadvantages of attacking on either fide equal.

## 2. Comfrufion of an Irris uiar Place fituated on a hill or rock.

In tire confruation of fuch places, care muft be tahen that no neighbouring hill commands any part of the works. The town thould alnays be built on the highelt part ; but if it thould be thought more convenient to place it lower, then the upper part muit be fortified with a fort. The fituation fhould be made level as near as pofitble, by romoving the earth from fome places to fill up others; and if it cannot well be levelled without extraordinary expence, works muft be made on the higheit part, fo as to command and protect the lower. The works onght to occupy all the upper part of the hill: hat if it thould be too extenfive to be all enclofed, or forirregulur as not to be fortified without great ineonvenience, the parts which fall without floould be forified with fome detached works, and a communicotion with the place mutt be made either above of under sman.l. 'there thould be no cavity or hollow roads within camon flot tound about the place, where the enemy ariugt be able to approach under cover. It there lheuld hapen to be alpring near the top of the i.ill, it thould be anclofed in the fortifation, or if that canoi le donse, b; fome wosk or other for there is wh hine more neceliar:, anl at the fane time farcer, in liah finmices, thon wuter; fors which reafon there r...nat be too nuch cre in providin! it : feveral cifantin ase tw be made to recrive the min water, and t. Heforve it ; whis hould be dag likenife, though
ever fo deep, the water of which will ferve for common ufe.

Places built on hills or rocks fhould never be large ; for their ufe is generally to guard paffes or inlets into a country, and are feldom uleful in traffic; and it is a difficult matter to provide for a large garrifon in fuch fituations: neither fhould any fuch place be built without fome very material reafons; but when it is abfolutely neceffary, great care and precaution fhould be taken to render the works as perfect as the fituation will admit of, and at the fame time to be as frugal in the expence as poffible.

## 3. Conflruction of Irregular Fortifications fituated near rivers, lakes, or the fea.

As the intent of building thefe kind of places is chiefly to facilitate and protect trade, they are of more importance than any other kind, efpecially in maritime countries, where the principal ftrength and power depends on them : for which reafon, we fhall treat of this conftruction more largely than of any other.

The firft thing to be confidered is their fituation, which ought to be fuch as to afford a good harbour for fhipping, or a fafe and ealy entrance in ftormy weather ; but as it is hardly poflible to find any where ftips may 0 in and lie fecure with all winds, care fhould be taken to make them fafe to enter with thofe winds which are moft dangerous: but it is not fufficient that the harbour is fafe againft ftormy weather, it thould likewife be to againit an enemy both by land and water, for it often happens, that fhips are de= ftroyed where it was imagined they were fecure, which is of too great confequence not to be provided againft; for which reafon, forts or batteries mult be built in the moll convenient places, to prevent the enemy's fhips from coming too near, fo as to be able to cannonade thofe in the harbour, or fling fhells amongft them; and if there is any danger of an enemy's approach by land, high ramparts and edifices muft be built, fo as to cover them.

When a river is pretty large, and it is not convenient for making a harbour without great expence, the fhips may ride along the fhore; which for that reafon, muft be made acceltible for thips of burden: this may be done by advancing the quay into the river if the water is too thallow, or by digging the river fufficiently deep for that purpofe.

And to prevent an enemy from coming up the river, forts mult be built on both fides, efiecially when there are any turnings or windings. Antwerp is fuch a place; for the Scheldt is fufficiently derp to carry thips of great burden which may come quite near the townwall; and feveral forts are huilt below it on both tides, to that it would not be an eafy matter for an enemy to come up the river.

When the river is but fmall, fo that no fhirs of burden can come throngh it, it is lutiecent to make it run through fome of the works, where proper landing-places are concived, from whence the goods may be carried into

[^1]

. N",

of into the place; as at Sarcelouis, where a hornwork is
Irregular built beyond the Sarre, in the gorge of which the
Furtifica- goods are landed.
tion.
$\underbrace{\text { tion. If the breadth of the river does not exceed } 200}$ yards, it commonly palles through the middle of the town, and proper quays are made on each fide ; in fuch a cafo, the fortification is fo contrived, as that the river paffes through the curtain, in order to have a battion on each fide to defend the coming in and going out.

When M. Vauban fortified near rivers, he made always the exterior fide near the water much longer than nay of the others; fuch as Hunninghen on the Rhine, and Sarrelouis on the Sarre; but for what reaton he fortified thefe places in that manner, has not been told ty any author.

But it is plain that the fides which terminate at the river are the weakeit; becaule the befiegers trenches being fecured by the river, they may draw mott of their troops off, and act therefore with more vigour and ftrength on the other fide: befides, as the ftrength of a fide increafes in proportion as the angle of the polygon is greater, by making the fide next the river longer, the angles at the extremities become wider, and confequently the adjacent fides itronger.

There are other advantages, befides thofe mentioned already, which arife from the lengthening that fide: for if the river is pretty deep, fo as not to be fordable, that fide is not liable to be attacked ; and by increafing its length, the capacity of the place increafes much more in proportion to the expence, than if more fides were made ; the centre of the place will be likewife nearer the river, which makes it more convenient for tranfporting the goods from the water fide to any part of the town.
FI'. 20. Toilluftrate this method of M. Vauban's, we fhall give the plan of Hunninghen : this place was built for the fake of having a bridge over the Rhine, for which reafon, he made it only a pentagon; the fide $A B$ next to the river is 200 toifes, and each of the others but 1 So.

About the fpace $a b c$, which lies before the front
 with fluice, to retain the water in the diekn, in dry feafons: and to prevant an erieny fiom deitroying the flaice near the foint $c$, wherehy the water would man
 in the litele it! and hadd by, in order lo cover that Ce...: auice; without which precaution the plate might be infulted from the siver lide, where the water is thellow in dry feafons.

The homwork K beyond the R hine was built to cover the bridge; but is this work camot be well defended arof the river, the hommork $H$ was made to fupport the other.

Before finilhing the defeription of this $\left[^{\text {than, we that: }}\right.$ fhow how to find the long fide AB.

After having inferibed the two fides GE, GF, in is circle, draw the diameter CD , fo as to be equally diflant from the line joining the points EF that is parallel to it. On this diametor fet off 100 toiles on each fide of the centre ; from thefe points draw two indefinite perpendiculars to the dimeter; then if from the points EF, as centres, two arcs are defcribed with a radius of 180 toifes, their interfections $A$ and $B$, with the faid perpendiculars, will determine the lons fide AB , as likewife the other two FB and E.A. Ia like manner may be found the long or thort fide of any polygon whatfoever.

When a place near a river is to be fortified for the fafety of commerce, particular care thonld be iaken in leving a good fpace between the houles and the water fide, to have a quay or landing place for goods brought by water; it thould alfo be contrived to have proper places for flips and boats to lie fecure in fiormy weather, and in time of a fiege; and as water-carriage is very advantageous for tranfporting goods from one place to another, as likenife for bringing the necellary materials, not only for building the tortifications, but alfo the place itfelf, the expences will be leffened confiderably when this convenience can be had; for which reafon, places fhould never be built anywhere elfe but near rivers, lakes, or the fea; excepting in extraordinary cafes, where it cannot be avoided.

## $\mathrm{F} \quad \mathrm{O} \quad \mathrm{R}$

Fortin
if
$\underbrace{\text { Fortitude. }}$

FORTIN, Forteler, or Field-fort, a fconce or little fort, whofe flanked angles are generally 120 fa thoms diftant from one another.

The extent and figure of fortins are diferent, according to the fituation and nature of the ground ; fome of them having whole baftions, and others demi-baitions. They are made ufe of only for a time, either to ucfend the lines of circumvallation, or to guard fome saffage or dangerous polt.

FORTISSIMO, in Mufic, fometimes denoted by IFF, or $f f f$, fignifies, to fing or play very loud or itrong.

FORTITUDE, a virtue or quality of the mind, generally confidered as the tame with Cotrace; though in a more accurate fenfe they feem to be ditinguifistle. Courage may be a virtue or a vice, acoordisy; Von. IX, Part I.

## F O R

to circumfances; fortitude is always a virtue : we fpeak Fortutude. of defperate courage, but not of defperate fortitude. A contempt or neglect of danger, without regard to confequences, may be called courage; and this fome brutes have as well as we: in them it is the effect of natural inflinct chielly; in man it depends partly on habit, partly on tirength of nerves, and partly on want of confideration. But fortitude is the virtue of a rational and confiderate mind, and is founded in a fenie of honour and a regard to duty. There may be courage in fighting a ducl, though that folly is more frequently the effect of cowardice ; there may be courage in an act of piracy or rolbery: but there can be no tortitude in perpetrating a crime. Fortitude implies a love of equity and of public good; for, as Plato asu Cicero ullerve, contage evented for a felfith purpole, or E witho..

## $\mathrm{F} O \mathrm{P} \quad\left[\begin{array}{ll}\mathrm{H}\end{array}\right] \quad \mathrm{F}$ O R

Futitude without a regard to juitice, ought to be caile a audacity rat're than tortitale.

Hav virt..e takes dufferent names, according as it acts in opposition to different furt; of cvil; but fome of thoie nomes are applicit with confiderable latitode. With repect to danser in general, fortitude may be termed intrepifity; with refpect to tie dangers of war, salmor with reffeet to pain of boly or dillrefs of mind, fatince; with relpect to laboor, arivity; with refnect to injory, forbeerance; with refpect to our condition in geveraf, mosnantimity.

Fortitude is sery becoming in both fixs ; but courage is not fo fuitable to the fambe characier ; for in women, on ordinary uccations of danger, a certain deg:ee of timidity is not unfeemly, becande it betokens genthenefs of difolition. Yet from thole of very high rank, from a queen or an eapreli, courage in emergencies of great public danger wenid te expected, and the want of it blamed; we thould ovcrlock the fex, and confider the duties of the ration. In genersl, however, malculive bollnen in a woman is difarecable; the erm airas conveys an offenfive idea. The fomble warrio of antiquity, whether real or fabulons, Camilla, ' Pbieftris, and the whole commanity of Amszoss, were unamable perfonages. But female courage exerted in defence of a child, a hubband, or a near relation, wculd be trae fortitade, and delerve the higheit encomiums.

The motives to fortitude are mary and powerful. This virtoe tends greatly to the happinef of the mdividua!, by giving compolure and prefence of mind, and keeping the other pafions in due fabordination. To public good it is efiential; for withcut it, the inSependence and liberty of nations would be impoffible. It gives to a characker that clevation which pots, orator, and hillorians, have in all ages vied with one anwher to celebrate. Nothing fo effectually infpires it is rational piety ; the fear of God is the beft lccurity asainft every other fear. A troe eftimate of human iife; its hivernels and uncortainty; the numberlefs eviry and temptations to which by a long continuance in this world we mut unavoidably be expofed; ought by no means to difourage or to throw any gloum on our future prolpects: they thould teach us, that many thirgs are mane formilable than death; and that nodings is loll, but much gainct, when, by the appointroent of Providence, a weil fpent life is brought to a raclatior.

Let it be conigered too, that palllanimity and feariulnets can never avail us any thing. On the contrary, they debafc oar natare, poiton all our comforts, a:d make us detpicable in the cyes of others; they caiken our reafon, difumert our fomem, enfeeble cur efforts, extinguifh our hopes, and add tenfold poicnancy to all the evib of life. In battle, the brave Beier is in lefs danger than the coward ; in le's danfer even of death and wounds, tecaute better prepared tw defend himfelf; in far lefo danger of infelicity; and has before him the animating bojee of victory and howur. So in lije, the man of true fortitude is in lefs dunger of difappointment than others are, becanfe his iondertanding is clear, and his mind dilencombered; he is prenared to meet calanity without the fear of mang under it: and be has lefore him the near pro-
fpect of another life, in which they who pioully bear the cvils of this will obiain a glorious reward.

FORTUNA, a goddefs worlhipped with great de votion by the ancient Greeks and Romans; who believed her to pretide over human affairs, and to distrihute wealth and honour at her plealure. See FokTENE.

FORTUNATE islanins, in Ancient Geog̣raply, certain illands (concerning the fituation of which asthors are not agreed) famous for the golden apples of the Hrsperides.- The common opinion is, that they aie the CAMAKy I/ands.

FORTUNE (Tv$\chi^{*}$ ), a name which among the ar cients leems to have denoted a principle of fortaits, wherely things came to pafs, without being neceli. tated thereto: but what and whence that principle is, they do not feem to have ever precifely thought. Hence their philofophers are often intimating, that men only framed the phantom Fortune to hide their ignorance ; and that they call Fortune whatever befals a man without his knowing for what purpole. Hence Juvenal (fat. N ver. 366 .) athirms, they weie men who made a deity of fortune.

## Nullum numen abefl, fis fil prodentin ; fidte Nos facimus, Furtune, deam, culoquet loanzus.

The iagenious Mr Spence gives another reading of this pallage:

## Nullum numen halies, fi./u prudentia ; fed to <br> Nos facimus, Furtura, deam, cal/ que locamus.

This reading, he thinks agrees beit with the context : Juvenal fays, ver. $35^{66}$, that the two things we thould pray for are good health and good tente; that we night be the nuthors of our own happinel's if we pleafed, ver. $3_{3} 6$. ; that vistue is the only way to true hap. pinefs, ver. $3 \sigma_{4}$; that if we ourlelves are prodent, Fortune has no power over us; and that, in truth, the i no goddefs at all, and has only ufurped a feat in heaven from the folly of manhind, ver. 366 . Fortune was yet confidered as a deity by the old Romans, bu: was made fo by the devotion and folly of the vulgar ; and Mr Spence lays, that he has feen an anciont gean, in which Cybete, the mother of the gods, is reprefented as turning atray her head from Fortone, in an attitude of difowning and rejecting her; (Polymetis, p. 150, 154 , \&c.)

According to the opinion of the heathens, therefore, fortune in reality wis only the arrival of things in a fudden and thexpected manner, without any apparent caule or reafon: fo that the philotophical lenfe of the word coincides with what is valuarly called chance.

But in religion it had a farther force; ahtars and temples in great nombers were contecrated to this Fortune, as a deity. 'This intimates, that the heathens had perfonifed, an:d even deified, their chance; and conceived her as a furt of goddefs, wh. difpoled of the tate of mon at her pleatiare. Hence that invocation of Horace, O diva, graium que regis Antizm, in the $35^{\text {th }}$ ode of the firit book, where he recommends Auguftos, then preparing for a vilit to Britain, to her protection. From thefe different fentiments it may be inferred, that the ancients at one time tock Fortune for a peremptory caufe, bent unon doing grod to

## $\mathrm{F} O \quad \mathrm{R}$

Fortane, fone, and perfecuting others; and fometimes for a Foity. blind incontant caufe, without any view or detcrmisa-
tion at all.

If then the word frrtune had no certain idea in the mouth of thote who erected altars to her, much le-1s can it be afcertained what it denntes in the mind of thore who now ufe the word in their writings. They who would fublitute the name Providence in lieu of that of Fortunc, cannot give any tolerable ienie to hali the phrales wheeein the word occurs.

Horace paints the goddefs, preceded by Necellity, holding tails and wedges in her hands, with a crampiron, and melted lead to fallen it ; rarely accomparied with Fidclity, undefs when the abandons a family; for in that cale Fidelity never fails to depart widh her, as well as friends.

She is direfpectfully fooken of by mott of the Roman writers, and reprefented as blind, incontant, unjuft, and delighting in mifchief, (ovid. ad Liz. ver. $5^{2}$, ver. 374 . Hur. lib. i. od. 34 . ver. 26. lib. iii. od. 29. ver. 15. Statius, Theb, xii. ver. 505.) However they had a good as well as a bad Fortune, a conitant and incondant Fortune; the latter of which was reprefented with wings, and a wheel by her, (Hor. lib. iii. od. 20. ver. 56.) Juvenal alludes to a hatue of Fortune, which exhibited her under a very gnod character, as the patronels of the poor infants that were expolied by their parents in the ftreets, (Sirt. vi. ver. 605.

The painters reprefent her in a woman's habit, with a bandage before her cyes, to thow that the acts without difcernment; and Itanding on a wheel, to expreis her initability. The Romans, fays Lactantius, reprefented her with a cornucopia, and the helm of a thi!, to ohow that the dittributes riches, and directs the atfairs of the world. In effect, it is with fuch characters that we fee her reprefented on fo many medals, with the infeription, fortuva avg. Fortuin redve, foktunet avg. or Redveis, \&ic. Sometimes the is feen pointing at a gloke before her feet, with a fceptre in one hand, and holding the cornucopia in the other.

The Romans had a virile as weil as a muliebrian Fortune, for the objects of their adoration: the Foriuna virilis was honoured ly the men, and the Fortuna mulielris by the women. They honoured Cortune allo under a vaifety of other appellations.

The Romans derived the worthip of Fortune from the Greeks, under the reign of Vervius Tullius, who dedicated the firt temple to her in the public manhet. Nero allo built a temple to Fortune. The Fortune worfipped at Antium was probably of the mont chalted character of any among the Romans; if we may judge by the account which Horace gives us of the great folemn proceffions that were made to her, (Hor. (ih. i. od. 25. ver. 22. But the molt celebrated temple of Fortune was at Preneite. Statius ipeatis of icveral Forturses there, and calls them the Prame/find ilirores, (lib. i. Sylv. iii. ver. 8o.)

Foksune-7ellers. Perlons pretending to tell fortuncs see to be pumihed with a year's imprifonment, and flanding four times on the pillory. Stat. ix. Gco. 11. $\therefore 5$.

FORTY DAys Cour', the court of attachement or woodmote, held before the verderors of the furelt onee every furty days, to inquire concerning all offenders ghaint vest and renion. See Itrachmbem.

FORUMI, in Ruman antiquity, a public hardiss place within the city of Rume, where canles wete jadicially tried, and orations delivered to the people.

Fotury was alfo ufed for a place of trathe, anfece ing to our market-place. Thefe were Fencrally calle. 1 fora venalia; in contreditiaction to the former, which were called fora ci:wh.a.

The fore crailia were publis courts of jutice, vely magnificent in thembelves, and furrounded with [orticoes and itately edifices; of thefe there were fix very remarkable: r. Frum Romamum. 2. Jialanum. 3. Augu/lum. 4. Palladum. 5. Forum Thajami. 6. Forian Saliyfiti. The Forum Romamum was the mort noted, and is often called fimply Forum, by way of eminerice. Here was the pleading place called Rofora, the Comitium, the fanctuary of Saturn, temple of Cafor, \&ic. See Rostra, Comithum, \&ic.

The fora steralia, or market-places, were very numerous. The chief of them were the forum hoartum for oxen or beef; fuarmm for livine; pigorium for bread; cupedinarium for dainties; olitorum for garden iluff.

The Grecian A 弓ogur exactly correlpond with the Roman fora, being places where courts and markets were held. At Athens they had many fora, but the chieft of them were the old and the ncw.

Forvm Indicere, was the act of the pretor appointing the place in Rome where caufes were to be tried. Agere forum denoted the bringing on caufes out of Rome, in a Roman province (Cicero, Suetonius); the fame with agere conventum (Florus).

The term forum added to a proper name, denoted fome market town or borough ; as,

Forvm Allunn, a place mentioned only by Tacitus; and, from what he fays of it, thought to be Ferrara, capital of the duchy of that tame in Italy. E. Long. 12. 5. N. Lat. .4+. 46 .

Forem Appii (Ciccro, Luke); a town of the Vulfci, in Latium, on the Via Appia, a little beyond the Tres Tabernac ; fet down in the Jerulalem Itinerary as 1 tuated near the river Nymplucus: now entirely extinct.

Fokema Cornelii, a town of the Cifpadana, built by Sylla: Now Imola, a city in Romagna, and turritory of the Pope. E. Long. 12. 12. N. Lat. $4 t$. 30.

Frium Domitii, a town of Gallia Nasbonenfis: prohobly built by Domitius Ahenobarbus, who commanded in thole parts: Now Frontignan, or Frontigniac, in Langseduc, near the Mediterranean. E. Long. 3. $3^{\circ}$. N. Lat. $43 \cdot 30$,

Forim Fulon, a town of Liguria, furnamed $V_{G} l_{\text {con- }}$ finum: from which it is conjectured that it is now l'alenow, in the duchy of Milan; which is confrmed by Peutinger's diftances. E. Long. $9^{n}$. N. Lat. $45^{\circ}$
Fordm Ga!lorzm, a fman town of the Ciipadana, on the Via Amilia, eight miles from Mutina, beyond the river Scultema. Here Antony defeated Panfa, and was in histurn defeated by Hirtius: Now Caflelfrancr, in the territory of Bologna, - Mother Forum Gallorum, a toma of the Vafoones in the Hither Spaia: Now Gurvea, a limall town of Arragon.

FORCs Yultum. There ae feveral towns of this name; as a Forum Yulum of Gallia Narbonenfs; or Fsitulum Now Frogus, or Frojules, in Provence, at E. 2
the.
$\mathrm{F} 0 \mathrm{~S} \quad\left[\begin{array}{lllll}6\end{array} \quad \overrightarrow{\mathrm{~F}} \mathrm{O} \quad \mathrm{S}\right.$
the nusth of the Argens. Foran Juiam Carnortam, to the north of Aquilia, in the Tranfpadma: Now Ci cidal d: Fion, formerly Cividal d' Aufria, in the territory of Venice.

Forva uhumarus, a town of the Infubres, in the Trmfipadana: Now Crema, cajital of the Crematro, in the territory of Venice. E. Long. 10. 15. N. Lat. 45. 22.

Forva Litiz, a town of the Semnones, in the Cifpadana : Now Furl, in Romagna. E. Long. 12. 45. N. Lat. 4.1. 25.

Forva Stzufanorum, fituated on the eat fide of the Liger, in Gallia Celtiea: now Fours, on the Loire, in the Lyonnois, capital of the territory of Forez. E. Long. 4. ${ }^{1} 5$. N. Lat. 45. 44:

Forem Tiberii, a town of the Pagus Ti,urinus, in Pelgica, on the left or fouth file of the Rhime : Now Kauf.r/ful'; literally the tribunal of Tiberius. which he hele! there when commander in the Rhetian war.

Forem V'olcani (S:rabo); the Campi Phligrai of Pliny : a place in Campania encompafted with rocky eniisences, near Puteuli, and dillant from it two miles towards Naples, emitting fmoke, and in fome places Hame, like a large extemive furnace, and yielding fulphur: Now called Sulfatara, in the Terra di Lavoro.

Foruar is allo ufed, among cafuilts, \&c. for jurifdiction; thus they fay, In for legir, \&e.

FOSS, or Fosse, in Furtification, \&c. a ditch or moat. The word is French, formed of the Latin participle f./rum, of the verb fidio," 1 dig."

Fuss, $F, r_{a}$, in Anatomy, a kind of cavity in a bone, with a large aperture, but no exit or perforation. When the aperture is very narrow, it is called a finur.

Foss is particularly ufed for the cavity or denture in the back part of the neck.

FOSS. migand, or Navicularis, is an oblong cavity, forming the infide of the pudendum muliebre, and which prefents itfelf upon opening the labia; and in the middle whereof are the carunciuk myrtiformes. See Ǎitovy.

Foss.l, in our ancient cuftoms, was a ditch full of water, where women committing felony were drowned; as men were hanged: Nam et ipli in omnibus tenementis fiuis omne" al, antiquo legalem hiabuere juftitiam, videlicet tirrum, foflam, furcas, et, finilia. In another fenfe it is taken for a grave, as appears by thele old verfes:

## Hic jacent in fofa Bedee vencrabilis offa: <br> Hic eft foflatus, qui bis erat hic cathedratus.

Foss 11 ay was anciently one of the four great Roman highways of England: fo called, according to Camden, becaufe it was ditched on both fides, which was the Roman method of making highways.

FOSSARII, in antiquity, a kind of officers in the eaftern church, whofe bufinets was to inter the dead.

Ciaconius relates, that Conftantine created 950 foffaries, whons he took out of the divers colleges or companies of tradefmen: he adds, that they were exempted from taxes, fervices, burdenfome offices, \&c.
F. Goar, in his notes on the Greck Euchologion, itfinuates that the foffarii were eftablifhed in the times of the apoitles; and that the young men, who carried off the body of Ananias, and thofe perfons fall of the
fear of God who interred St Stephen, were of the nember.

St Jcrome afferes us, that the rank of foffarii held the firtl place among the clerks; but he is to be underflood of thofe clerks only who hait the direction and intendance of the interment of the devout.

FOsse, the Roman military way in South Pritain, begins at Tomefs, and palles through Exeter, Ivelcheiter. Shenton Mallet, Bath, Cirencefter, Leicefter, the Vale of Beivoir, Newark, Lincoln, to Barton upon the Humber, being fill vilible in leveral parts, though of 1400 years ftanding. It had the name from the folles or ditches made by the dides of it.

FOSS1L, in Natural Hiffory, denotes, in general, every thing dug out of the earth, whether it be a native thereof, as metals, flones, falts, earths, and other minerals; or extraneous, repofited in the bowels of the eath ty fome extraordinary means, as earthquakes, the deluge, \& \&

Natize follils are fubtances found in the earth, or on its furface, of a fimple itructure, exhibiting no appearances of organization; and thefe are included under the general names of fimple and compound, earthy or metallic minerals. See Mineralogy.

Extraneous foffils are bodies of the vegetable or animal kingdoms accidentally buried in the earth. Of the vegetable kingdom, there are principally three kinds; trees or parts of them, herbaceous plants, and corals. and of the animal kingdom there are four kinds; fea fhells, the teeth or bony palates and bones of fifhes, complete fithes, and the bones of land animals. See Grology.

Thefe adventitious or extraneous foffils, thus found buried in great abundance in divers parts of the earth, bave employed the curiofity of leveral of our latetc naturaliits, who have each their feveral fyltem to account for the furprifing appearances of petrified fea filhes, in places far remote from the fea, and on the tops of mountains; thells in the middle of quarries of tlone; and of elephants teeth, and bones of divers animals, peculiar to the fouthern climates, and plants only growing in the eaft, found foffil in our northern and weltern parts.

Some will have thefe fhells, \&c. to be real ftones, and itone plants, formed after the ufual manner of other figured fones; of which opinion is the learned Dr Lifter.

Another opinion is, that thefe folfil flells, with all the foreign bodies found within the earth, as bones, trees, plants, \&c. were buried therein at the time of the univerfal deluge ; and that, having been penetrated either by the bituminous matter abounding chiefly in watery places, or by the falts of the eartb, they have been preferved entire, and fometimes petrified.

Others think, that thofe thells, found at the tops of the highelt mountains, could never have been carried thither by the waters, even of the deluge; inafmuch as moft of thefe aquatic animal, on account of the weight of their fhells, always remain at the bottom of the water, and never move but clole along the ground. They imagine, that a year's continuance of the waters of the deluge, intermixed with the falt waters of the fea, upon the furface of the earth, might well give occafion to the production of hells of divers kinds in different
climate: ;

## F O S

$\underbrace{\text { Forer. }}$ climates; and that the univerfal faltacis of the woter was the real caufe of their refemblance to the fea theth, as the lakes formed daily by the retention of rain or fpring water produce dificerent kinds.

Others think, that the waters of the fea, and the rivers, with thote which fell from henven, tumed the whole furface of the earth apfide down ; after the fame manner as the waters of the Loire, and other riveri, which roll on a fandy bettom, overturn all their fands, and even the earth iticlif, in their fwellings and inundations; and that in this general futwerfion, the thells came to be interred here, fifhes there, trees there, \&ic. Sie Defice.

1) Woodward, in his Nitural Hitory of the Earth, purfuing and improving the hypothelis of Dr Burnet, maintains the whole mals of earth, with every thing belonging thereto, to have been to broken and diffored at the time of the deluge, that a new earth was then formed on the bofom of the water, contifing of different itrata or beds of terreitrial matter, ranged over each other ufually according to the order of their fpecific gravitics. By this means, plant', animals, and efpecially fithes and ihells, not yet dilloived among the $r k$, remained mised and blended among the mineral and foifil matters; which prelenved them, or at leall allumed and retained their figures and impreflions either indentedly or in relievo. Sic Ghology.

Fossil Pache See Petroreem, Mineriaggy Index.

FOSTER JMEs, a nonconfurmitit divine, very highly celebrated for his pulpit eloquence and erudition, was born at Excter in the year 1697. At the age of five ycars he was put to the free ichool of that city, where his, progrefs in the acquifition of grammar was io rapid, that his malter boattel of him as the molt eminent genius in his fchool. From this feminary be went to the academy where young men deligned for clergymen in the dilifenting interett werc educated, where his progrefs and applaufe were equally great. His apprehenfion was reinarkably quick, his judgment folid, memory retentive, cloquence commanding, and his talents fur argumentation were truly admirable; but above all, his piety was genuine, and few men poffeficd candour, modelty, liberality, integrity, tendernefs and benevolence, in fuch a remarkabie degrec. He commenced preacher at the age of 21 , and was much admircd where he occafionally officiated. About this time the doctrinc of the trinity was much agitated in the welt of England, which was not confonant to the nutions of Mr Fofter, and the honcity and opennefs of his heart wculd not allow him to conceal thefe, which brought fo much odium upon him foom the orthodos party, that he retired to thuther fene of action. He became paffor of a congregaion at Milloorne-fort, in Somerfetliire; but as foon as his hearers became zealouly attached to what was deemed the orthodov opinion, he retired to Alhwick under the hills of Mendip, in the fame county. In thi) aflum he preached to two congregation at a little dift.ince from each other, as poor as they were plain, the united contributions of which did not amment to 15 l. per annum. Ia this humble poverty and ubfurity he lived for fome ycars, honourable, however, as it was occationed by his determined uprightnefs and fancerity. In the year 1722 , he gave the world hi, "Eflay on
$37 \quad \mathrm{E}$ O S
Fundmentat, with a particular regard to the doc. F ie thine of the ever-blefied 1rimity," \&. The defigh of $-\infty$ this wotk was to check ans unihuritable and intolerent firit, at that time extremely pacolent, by thowing that the tinitalian nution is i.en a fur durental article of Chritianity, or made an eurris ectaition of falsation in the facre: fowiptere a detmon acompanict this eniny, entitled " T": refurrection ut Chrit ; insed, and vindicated dä.int the med importan ohjecticus of the ancient Jew-, or moden Deift, and hi difciplen flom to be fullicient witnello of the fact." Froms Ahawich he removed to Trowbridee in Wihthite, where his corigregation did not whilly excecd 22 or $3 \supset$ people.

By reading Dr Gale's treatice on intant baftifm, he bectme a convert to the doctine, that inumerfion is the trne fcrip:urai rite, and was accordingly foon after baytifd in Lendon in confurmity to that mode. Tla uareferied manner of adopting whaterer his conficience 'veli wed to be treth, cacludel him fiom almoll every religions paty amory whom he might otherwife lave expected preferment. But white he deliberated with himelt whether be thould abandon the miniltry, and acpuire the knowledge of fome mechanical employ ment, Robert Houlton, Eli. took him to li, houte in the cupacity of cllaphain, where his cire of azquain: ances became wider and more refpectabue. In 1724. he was appointed to fucceed $\operatorname{Dr}$ Gale in the baptitt congregation in Barbican, London. In the year 1728 he commenced a Sunday evening lecture in the Old Iewry, which he continued till within a thort time of his death, with fuch a degree of popularity as few diflenters at that time experienced. In 173I appeared his valuable work, entitled " The ufefulnefs, truth, and excellency of the Chrittian revelation, defended againit the objections contained in a late book, called Chriitianity as old as the Creation," \&c. In this reply Mr Fotter exhibited no ordinary thare of talents and ingenuity, and it was admired by the candid and judiciotis of every defcription. Dr Tindal, againt whom it was written, is faid to have fpoken of it always with great relpect. He publified a volume of fermons in the year 1734, followed by other three volumes, the lait of which appeared in $17++$. At this time he was appointed fucceflor to Dr Jeremiah Hunt, in the protiftant congregation at Pinner's-hall. In $174^{6}$, he attended the earl of Kilmarnock when under fentence of death for hightreafon, after which he puliilhed an otavo pamphet. with the title of "An account of the behaviour of the late earl of Kilmarnock after his featence, and on the day of his execution."

He received from the Marifhat collese of Therdeen the degrec of doctor in divinity, accompanied with handiome letters from the principal and Profetlor For. dyce, the latter of whom thus :adraded him. "We beg that you will be fo grood a to ascept of the diplo ma, an a fmall mark of the fincere vetheration we have for you, and of the fufe we entern in of the eminent fervices you have done to the caule of rimerte, religions, and virtue, by your writing in well ar public intructions," The firil volume in quarto, of his • Difourk on all the Principal Branches of Natural Retighom and Sucial Vaituc,' was publihed in the year then, wad she fecond appeared in 1752 . They were publiuhed t: hubeription; and to evince the high edimation is whict

Ister in thenow a d vitue were held, $20=0$ tames were con$\|$ tained in the liz, many of them dikinguinced by their Euhergi! di nitied tank and literam abilitics.

In the munth of April 1750 , he was feized with a wilent diftumper, from the effects of which he never thoroughly recovered; yet while at all abie to oficiate, he continued to preach till the beginning of 1,52 , when se had another attack, which feems to have been of a 1salytic matare. After declining for fome time, he expited like a genuine Chritian on the $j$ th of Novem her, in the $55^{t h}$ year of his age. His private and public hite were alike irreproachable. Such was the wondesful extent of his beneficence, that he muit have died in indigent circumatances, had it not been for the numerous fubicriptions to his difcourfes on natural religion. Mr Rider gives him the following eulogium. "Hic voice was naturally fweet, ftrong, diftinet, harmonious, always adapted to his matter, always varied as his metliod changed; as exprellive of the fenle as the moft judicious recitative. Monotony was a fault he was never guilty of. His action, the foul of eloquence, was grave, expreffive, free from diftortions, animated without being theatrical; in fhort, fuch as became the pulpit. He reminded us of Paul at Athens, arrefting the attention of his auditors." It was no doubt fuch rare accomplifiments which induced Mr Pope to be an occafional hearer, and to pay him the following compliment :

Let modeft Fonter, if he will, excel
Ten metropolitans in preaching well.
In a poem defcribing the refpective merits of diffenting minitters at that poriod, and fuppofed to have been the work of Mr Savarge, we find the following lines upon Dr Fotter.

But fee th' accomplith'd orator appear, Renind his language, and his reafoning clear ; Thou only, Foiter, haft the pleafing art, At once to charm the ear, and mend the heart.
Benides the works furmerly taken notice of, Dr Foiter publified three funeral fermons, one of which was intended for that celebrated confellor Mr Emlyn; together with a number of cfays in the Old Whig.

Fosprr, Samul, an ingenious Englith mathematician o. the lat century, and aftronomical profeflor in Grefham college, was one of that learned afociation which met for cu'tivating the new philuophy during the political confufions, and which Charles II. eitablifhed into the Royal society. Mr Folle:, however, died in 1652, before this incorporation took place; but wrote a number of mathematical and aftronomical treatifes, too many to particularize. There were two other mathematical fudents of this name; Wiiliam Fotter, a difciple of Mr Oughtred, who taught in London; and Mark Foller, $\therefore$ thior of a treatite on trigonometry, who lived later tan the former two.

FOTHIER, or FODDER, is a meight of lead, contaising cight pizs, and every pig one and twenty It one and a half; fo that it is aboat a ton or common cart luat. Amoner the plumbers in London, it is nineteen hunded and it half; and at the mines it is two and Ewenty hundred and athalf. The word in of Teutonic ming from fuder.

FOlHERGILL, Dr Glorgr, was born in Weht
morland in 1705 , where his family had been long fthereit. leated on a competent eifate that had defcended regulurly for feveral generations. After an academical education in Queci's college, Osford, of which he became a fellow, he was, in 1751 , elected principal of St Edmund's hall, and prefented to the vicarage of Brumky in Hamphire. Having been long atficted with an atthma, he died in 1760 . He was the author of a collection of much eiteemed fermons, in 2 vols, 8 vo. The firt volume confifts of occafional difcourles, publined by himelf; the fecond printed from his NISS.

Fothergill, Dr Yuhn, a late eminent phyfician, fon of John and Margaret, Quakers, was born in 1712, at Carr End in Yorkhire, where his father, who had been a brewer at K narefhorough (atter having travelled from one end of America to the other), lived retired on a fmall eftate which the cultivated. The Doctor was the fecond of five clildren (four fons and a daughter), and received his education under the care of his grandfather Thomas Hough, a perion of fortune i: Chefhire, which gave him a predilection for that county), and at Sethergh in Yorkhire. He afterwards ferved his time to one Mr Bartlett an apothecary at Bradford. From thence he removed to London, and becanse a pupil of $\mathrm{Dr}_{r}$ (afterwards Sir F.dward) Wilmot, at St Thomas's Hotpital. He then went to the univerfity of Edinburgh to itudy phyfic, and took hiv dueter's degree there. From Edinburgh he went to Leyden; whence, after a thort itay, he returned to London, and began to practife about the year $174^{\circ}$, in a houfe in White-hart Court, Lombard-ifreet, where he refided during the greatett part of his life, and acquired moit of his fortune. In 1746, he was admitted a licentiate of the College of Phyficians in London; and in 1754 a fellow of that of Ediaburgh, to which he was a confiderable benefactor. He afterwards became a member of the Royal Medical Society at Paris, and a member both of the Royal and Antiquarian Societies. He continued his practice with uninterrupted fuccefs till within the laft two years of his life, when the illnefs which he had brought on himielf by unremitted attention, obliged him to give up a confiderable part of it. Befides his application to medical ficience, he had imbibed an early tafte for natural hitory, improved by his friend Peter Collinfon, and employed himfelt on coquillage and fmaller objects of botany. He was for many years a valuable contributor to the Gentleman's Magazine ; where his obfervations on the weather and difeafes were begun in April 1751, and difcontinued in the beginning of 1756 , being difappointed in his vrews of exciting other experienced phyficians in different parts to imitate the example. He had very extenfive practice, but he did not add to his art any great or various improvements. His pamphlet on the wicerous fore throat is, on every account, the bet of his publications; but owes much of its merit to the information of the late D: Letherland. It wa, firt printed in 1748 , on the re-appearance of that fatal diforder which in 1739 hal cartied of the two only fons of Mr Pelham. In 1 ght 2 D. Fothergilt purchaied an eitate at Upton in Eflex; and formed a botanic garden there, the fecond in Europe; hew is the firit. In $1-66$ he began regularly to withdraw, from Midfummer to Xlichaelmas, from the evcenive fatigue of his profelfion, to Lee-Hall, near Middewich, in Chefine; which, though he only rent-

##

He wot no fec, doring thi :esefs, hut atmentod to predrebe gratis at on innat 2tiddendioh once a veck. 1. 106-, atter he found himtelf oblized to reva lis attention to bugmels. he removed imm lis howf in: :e (ity, to rolide in Harpur-itreet, Ked-Lion Sjuate. Some time before his death he lad been imlutrons to contrive a mothod of generatiag and prefersing ice in the Weit Indies. He was the patron of Sidmey Putlimfon, and dres $u_{p}$ the freface prefixed to his acrount of the vayage to the Suath Stas. At his aronce ato was made and primed thentire new trand anon of the whole Bible, from the Hetrew and Greek onigad. Ly Anthony Purver, a Quaker, in two rowmes, 1764 , folio, and al.o, in 1750 , an edition of Bithop Percy's " Key to the Ners T'vilament," adapted to the uie of a fembary of young (guakers, at Acworth, near Letds in Yorkinire, founded in 1778 by the Socicty, who purchaled, by a fubfeription in which Dr Yothergill thood foremont, the houle and an elt.ite of thirty acres which the Foundling Hofpital held there, but which they fom inconvenient for their purpofe on account of dittance. The Duetor himfeit fint projected this on the plan of a fmaller inftitution of the fame kind at Gilderfomes. He alfo endowed it handlomely $\mathrm{L}_{\mathrm{y}}$ his will. It now contains atove 302 children of koth lexes, who are clothed and initructed. Among the other beneficent fhemes juggelted by Dr Fothergill were thofe of bringing fih to London by land carriage, which, though it did not in every relpect fucceed. tended to deftroy a fuppoied combination: and of rendering bread much cheaper, though equally wholefome, to the poor, by making it with one part of potatoes and three parts of houfehold tour. Bit his pablic benefactions, his encouragemests of fienence, the intances of his attention to the heath, the police, the comenience of the metropoit, \&ic. we camot pretend to fpecify. The fortune which Dr Futhorgill had acguired was immenfe; and, taking all things together, the houfe and moveables in Harpur-ftreet, the property in Ellex, and the eltate in Chethise (which he held on $\therefore$ leafe, and his ready moner, amounted to $\delta 0,0<01$. His buinefs when he was in full practice was calculated at near neonl. per annum. In the infiuenza of 1775 and $17-6$, he is laid to have bad 60 pationts va his lift daily, a:d his profit wav extimited at $800=1$. fer atmam.

The diforder which hattened his death was a firrhus of the proftata, and an offerution in the bladder in which were found after ki death two quati of rater), which had been gradually coming on him for is years patt, occatoned By a delicacy, which made him unwiling to alight from his carriage, and when, after his tempozary reco:cry trom it the year before he died, be fubmitted to ufe relict in his carriage, it was too late. A 1 . Powht here, was tried and behaded in the hall; and her fon afterwards, forgiving and even taking into favour her greateft enemy Cecil, only took the childith revenge of beating down the cafle; which he fo compeecly demolihed, that no more than the earthworks now remain. Within the firt work is a farm-houfe "ith lome carved ftoncs wrought into it, and at the fouth-weft corner of the inner trench are fome mafles of Itone walks. Sir Robert Cotton carricd the wainfor of the hall to Connington.

FOU-TCHEOV, a city of China, in the province of Fo-fins. It carrics on a confiderable trade; but is cliefly remarkable for the magnificence of its principal bridge, which has more than 100 arches, conilructed of white itone, and ormamented with a double baluftrade throughout. This city is the relidence of a viceroy, and has under its jurifdiction nine cities of the third clafs.

FOUGADE, or Coticasse, in the art of war, a little mine, about 8 or 10 fect wide, and 10 or 12 deep, Cug under fome work or poft, which is in danger of falling into the enemy's hands; and charged with facks of powder, covered with flones, eath, and whatever elle cau make great dellruction. It is lit on fire like ther mines, with a faucifle. Sce Mine.

YOUL, or Foule, in the fea language, is ufed "hen a hip has been long untrimmed, fo that the grafs weeds, or barnacles, grow to her fides under water. A rope is allo foul when it is either tangled in itfelf, or hindered by another, fo that it cannot run or be overhauled.
Fol's imports, allo, the ruming of one flap againft another. This happens fometimes by the violence of the wind, and fometimes by the carelefsnefs of the people on board, to flips in the fame convoy, and to ilips in port by means of others coming in. The damages occafoned by running foul, are of the nature of thofe in which both parties mult bear a flare. They are ufually made half to fall upon the fufferer, and half upon the veffel which did the injury; but in cafes where it is evidently the fault of the mafter of the veffel, he alone is to bear the damage.

Focl-Water. A flip is faid to make foul water, when, being under fail, the comes into fuch ftooal water, that though her keel do not touch the ground, yet it comes fo near it, that the motion of the water under her raifes the mud from the bottom.

Fo's is alfo a difeafe in cattle, proceeding from hlood, and a waterifh rheum that falls down into the lege, and makes them fwell.

Fovi or Pimpled Face. See Gutia Rofacea.
FOULA, or FovL I/land, one of the Shetland infes, lying between fix and feven leagues weft from the main land. It is about three miles long, narrow, and full of rough, fteep, and bare rock; ; one of which is io large, and runs up to fuch a beight, that it may be clearly feen from Orkney. This, it is probable, is the Thule of Tacitus. It has fcarcely any pafturage, and but little arable land. The only commodities exported are flock filh, train oil, and feathers.

FOULAHS, a vect'e of Africa, which inhabit the confines of the great def r: Sahura. The principal of the Foulah intes is that w... :n Sierra Leona, and of which Jetembo is the capital. See Sierr.s Leoma.

FOUMART, if fuccies of Mustrin. See MaM- Eumart Malis Index. buiding which is under ground. Sce Arcmineterf, No 104.

Palladio allows a fixth part of the height of the whole building for the hollowing or under-digging; mulefs there be cellars under ground, in which call be would have it fomewhat lower.

Fousintios, denotes allo a donation or legacy, either in money or lands, for the maintenance and fupport of fome community, hofpital, fchool, \&c.

The king only can found a college, but there may 'facib's be a college in reputation founded by others. If it Lazv Dita. cannot appear by inquifition who it was that founded a church or college, it thall be intended that it was the hing, who has power to found a new church, \&c. The king may found and erect an hofpital, and give a name to the houfe upon the inheritance of another, or licenfe another perion to do it upon his own lands; and the words fundo, creo, \&c. are not neceflary in every foundation, either of a college or hofpital, made by the king; but it is fufficient if there be words equivalent : the incorporation of a college or hofpital is the very foundation; but he who endows it with lands is the founder; and to the erection of an hofpital, nothing more is requifite but the incorporation and foundation. Perfons feifed of eftates in fee fimple, may erect and found hofpitals for the poor by deed enrolled in chancery, \&c. which thall be incorporated, and fubject to fuch vifitors as the founder fhall appoint, \&c. ftat. 39. Eliz. c. 5 .

FOUNDER, in a general fenfe, the perfon who lays a foundation, or endows a charch, fchool, religious houfe, or other charitable infitution. See Fousdation.

Founder, allo implies an artift who cafts metals, in various forms, for different ufes, as guns, bells, flatues, printing characters, candlefticks, buckles, \&c. whence they are denominated gun-founders, bell-founders, fi-gure-founders, letier-founders, founders of finall works, \&c. See Foundery.

Founder, in the fea language: A flip is faid to founder, when by an extraordinary leak, or by a great fea breaking in upon her, the is fo filled with water, that the cannot be freed of it; fo that the can neither veer nor fteer, but lie like a $\log$; and not being able to fwim long, will at laft fink.

FOUNDERED, in Farricry. Sce there, § sli.
FOUNDERY, or Foundry, the art of cafting all forts of metals into different forms. It likewife fignifies the workhoufe or finelting hut wherein thefe operations are performed.

Founderr of Small Works, or cafing in Sand. The fand ufed for calling fimall works is at frill of a pretty foft, yellowifh, and clammy nature; but it being necefiary to ftrew charcoal duit in the mould, it at length becomes of a quite black colour. This fand i, worked over and over, on a board, with a roller, and a furt of knife; being placed over a trough to receive it, after it is by thefe means futticiently prepared.

This done, they take a wruten board of a length and breadth proportional : the things to he caff, and putting a ledge round it they thll it with land, a little

## F O U

Founderg. millened, to thate it duly colere. Then they tahe e:ther wood or netal models of what they intend to cath, and apply them to to the moult, and pretis tiem into the fana, as to leave their impretliun there. Along the middte of the mould is laid half a fmall brats cylinder, as the chic fand for the metal to rum throug?, when meited, into the models or patterns; and from this chief canalare placed feveral others, which eatend to eath model or pattern placed in the frame. After this frame is finilhed, they take out the pattems, by frit luofening them all round, that the fand may not give way.

Then they proceed to work the other half of the mould with the fame patterns in juit fuch another frame; only that it has pins, which, entering into holes that correfpond to it in the other, make the two caviLies of the pattern fall exataly on cach other.

The frame, thus moulded, is carried to the melter; who, after extending the chief canal of the counterpart, and adding the crofs canals to the feveral models in both, and ftrewing mill dutt over them, dries them in a kind of oven for that purpofe.

Both parts of the mould being dry, they are joined together by means of the pins: and to prevent them giving way, by reafon of the melted metal paling through the chief cylindrical canal, they are fcrewed or wedged up like a kind of prefs.

While the moulds are thus preparing, the metal is fufing in a crucible of a fize proportionate to the quantity of metal intended to be caft.

When the moulds are coolin, the frames are unfcrewed or unwedged, and the caft work taken out of the fand, which fand is worked over again for other cafting.

Foundfry of Statues. The cafting of flatues depends on the due preparation of the pit, the core, the wax, the outer mould, the inferior furnace to melt off the wax, and the upper to fufe the metal. The pit i, a hole dug in a diy place iomething deeper than the inrended figure, and made according to the prominence of certain parts thereof. The infide of the pir is commonly lined with tione or brick; or when the figure is very large, they fometimes work on the ground, and saife a proper fence to refift the impulion of the melted metal.

The inner mould, or core, is a rude mafs to which is given the intended attitude and contours. It is raifed on an iron grate, frong enough to fultain it, and is ftrengthened within by feveral bars of iron. It is generally made einner of potters clay, mived with hair and horfe dung ; or oi plafter of Paris mixed with brick duit. The ule of the core is to tupport the wax, the thell, and lefien the weight of the metal. The iron bars and the core are taken out of the brafs figure through an aperture left in it for that purpole, which i- foldered up afterwards. It is neceflary to leave fome of the iron bars of the core, that contributc to the ittadinefs of the projecting part, within the brals tigure.

The wax is a reprefentation of the intendel ilatue. if it be a piece of iculpture, the was fhould be all ot the fculptor's own hand, who ufually forms it on the core: Thuugh it may be wrought le parately in cavitice, moulded on a molel, and afterwards arronged on the

Vot. IX Part $\mathrm{I}^{\text {. }}$

 the wo.

Whem the wax, whel, i, tombed thita, a of
 pendicuar to it from top : botom, to ins id canals for the comeyance of the mena to all I res of the work; and as vent hole, to give puficentan
 hot metal came to encompatis it.

The work being brought thav far, muft be -weat. with its eliell, which is a hime of cruth lide over the was, and which being of a iu:t matter, cally reweiv: the inpreffion of cvery part, which is afterward, cunmunicated to the metal upon its t.king the phace of the was, between the ihell and the mould. The the: ter of this outer mould is varied according as cinituot $l_{\text {dyers }}$ are applied. The fird is generally a conapofition of clay, and old white crucibles well groun 1 and fitsed, and mixed up with water to the co:ffitetce of a colour fit for painting : accordingly they apt ly it witi a pencil, laying it feven or eight times urer, and heting it dry between whites. For the lecond impreilien they add horle dung and natural earth to the former compoition. The third imprefion is only horfe d ag and earth. Laftly, The thell is finihed by laying on feveral more impreliions of this lad matter, made very thick with the hand.

The ibell, thus finithed, is fecured by feveral iron girths, bound round it, at about :If a foot diliance from cach other, and fattened at the butum to we grate under the ftatue, and at top to a circle of itca where they all terminate.

If the itatue be fo big that it would not be eafy io move the moulds with lafety, they mult be wrought on the fipot where it is to be calt. This is performes? two ways: in the firft, a fquare hole is dug uad=: ground, much bigger than the mould to be mate therein, and its infide lined with walls of fret-ftone on brick. At the botom is made a hole of the inere materials, with a kind of furnace, having its aperture outwards: in this is a fire made to dry the moun, and afterwards melt the was. Over this fumnce is placed the grate, and upon this the mould, \&c. fimme as above. Lattly, At one of the edges of the iquare pit, is made another large furnace to melt the martit. In the other way, it is fufficient to work the mant? above ground, but with the like precuation of a 1 ir nave and grate underneath. When tinihed, tow with are to be run around it, and by the life therus a maffive made for a meling furnace. For the rett, the method is the lame in both. The mould bemg tinilhed, and enclofed an deficribed, whether unter quand or above it, a mo'eras fire is lightel in the furance under it, and the whule covacd with planh, that the wax may mach gently down, and run out it piper rontrived for that purpole, at the foot of the mould, which are aterward exactly clofed with carth, fo toun as the was is carried ut. This done, the hole is thled up with bricks thrown i:1 at randon, and the fire in the furnace augmented, till fuch time as both tho tricks and mould become rid hot. After thi, the fine beiny extinguithed, and every thing cold a Ih.... F t.

## F O U $\quad$ U $42 j \quad$ j O U

Inmber: the: trine out the 1-sichs, ath fill op their place with eaninmoidened, und a little Leaten to the top of tise
 'Tikic pespuratory mownes being duly takea, there remins nothing lut to meit the metal, and run it into the ramud. This is the onice of the furmace above defriard, which is comony made in the form of an overt with thee mentures, one to put in the wood, monter fir a vent, and a inird to ruas the metal out at. irom thin lat afoathe, which is kept very clole while the metal is in fution, a tmall tube is laid, whereby the melied metal is conveyed into a large earthen baton, over the mould, into the bottom of which all the big branches of the jets, or calte, which are to convey the metal into all the parts of the mould, are inleated.

Theie caits or jets are all terminated with a kind of plugs, which are kept clofe, that, upon opening the furnace, the braf, which guiles out with violence, may not cater any of them, till the bafon be full enough of mater to run into them all at once. Upon which occalion they pull out the plugs, which are long iron rods with a head at one end, capable of filling the whole diameter of each tube. The whole of the furwi.ne $i$ - opened with a long piece of iron fitted at the end sieash pole, and the mould filled in an initant. This completes the work in relation to the calting part ; the reft being the feuptor's or carver's bufinefs, who, taking the figure out of the mond and earth wherewith it is encompanied, faws off the jets with which it ap$f^{\prime}$ eirs covered over, and repairs it with chiffels, gravers, pircheons, \&c.

Folndert of Bells. The metal, it is to be obferved, is diferent for vells from what it is for Astues; there being wo tin in the ftatue metal; but these is a fifin, and fometimes more, in the bell metal.

The dimet.fions of the co-e and the wax for bells, if a chime of bells efpecially, are not lef: to chance, but z:muf be meatured on a feale, or diapafon, which gives the beight, aperture, and thicknefs, ncecflary for the ieveral tones required.

1: is on the wax that the feveral mouldings and other ranaments and infcriptions, to be reprefented in reliavo on the outlisu of the bell, ase formed. The chapoet or tonque is not properly a part of the bell, but is furnithed from other hands. In Europe, it is winally of iron, with a large knob at the extreme; and is fulfended in the middle of the bell. In China, it is only a luge wooden mallet, fruck by force of arm as aitut the bell ; whence they can have but little of that cortenancy fo much admired in fome of our chimes of halis. The Chinefe have an e::traordinary way of increating the fond of their belis, viz. by leaving a hole under the cannon; which our bell-founders nould reckon a defect.

The proportions of our bells difier sery much from thofe of the Chinefe. In ours, the modern proportions are, to make the diameter 15 times the thicknefs of the brim, and the height 12 times. The parts of a well are, 1. The fow:ding bore, termimated by an inferior circle, which grows thinner and thinner. 2. The brim or that part of a beil whereon the clapper Itrikes, and which is thicker than the relt. 3. The outward
firkiag of the nishe of the bell, or the puint under Foundery. whin it grove wider to the brim. 4. Whe wain or furnitare, and the part that grows wider and thicker quike to the brim. 5. The uper vale, or thot pat which is above the wait. 6. The pallet which fupports the daple of the clapper within. or The bent and holloned branches of metal uniting with the cannons, to receive the iron key, where'y the bell is huns up to the beam, which is its fupport and counterpoife when rung out.

The bufinels of bell foundery is reducibie to three particulars. 1. The proportion of a lell. 2. The forming of the mould. And, 3. The nelting of the metal. 'There are two hinds of proportions, viz. the fimple and the relative; the former are thofe proportions only that are between the feveral parts of a bell to render it fonorous; the relative proportions eftablih a requifte harmony between feveral bells.

The method of forming the profile of a bell, previous to its being calt, in which the proportion of the feveral parts may be feen, is as follows: the thicknefs of the brim, $\mathrm{C}_{1}$ (Plate CCXXIII.) is the foundation of every other meature, and is divided into three equal parts. Firft, draw the line HD, which reprefents the diameter of the bell ; bifect it in I and erect the perpendicular F $f$; let DF and HF be alfo bifected in E and G , and two other perpendiculars $\mathrm{E} e, \mathrm{G} a, \mathrm{bc}$ erected at E and G : GE will be the diameter of the top or upper vafe, i. c. the diameter of the top will be half that of the bell; and it will, therefore, be the dinmeter of a bell which will found an octave to the other. Divide the diameter of the bell or the line HD into 15 equal parts, and one of thefe will give C 1 the thicknefs of the brim; divide again each of thele 15 equal parts into three other equal parts, and then form a fcale. From this fale take 12 of the larger divifions or $\frac{2}{5}$ of the whole fale in the compals, and fetting one leg in $D$ defcribe an arc to cut the line $\mathrm{E} e$ in N ; draw ND, and divide this line into 12 equal parts; at the point 1 crect the perpendicula* ${ }_{1} \mathrm{C}=10$, and $\mathrm{C}_{1}$ will be the thickaeds of the brim $=\mathrm{I}_{\mathrm{S}}^{\prime}$ of the diameter: draw the line CD ; bifect DN ; and at the point of bifection 6 crect the perpendicular $6 \mathrm{~K}=1 \frac{1}{2}$ of the larger divinons on the fcale. With an opening of the compars equal to twice the length of the feale or 30 brims, fetting one leg in N, defcribe an arc of a circle, and with the fame leg in K and the fame opening defcribe another are to interfect the former : on this point of interfection as a centre, and with a radius equal to 30 brims, defcribe the are NK ; in 6 K produced take $\mathrm{KB}=\frac{\frac{1}{3}}{3}$ of the larger meafure of the fiale or $\frac{1}{3}$ of the bim, and on the fame centre with the radius $30 \frac{1}{5}$ brims defcribe an arc $A B$ parallel to NK. For the arc BC, take 12 divifions of the fale or 12 brims in the compafs; find a centre, and from that centre, with this opening, defcribe the are BC, in the fame manner as NK or AB were defcribed. There are various ways of deferibing the are $\mathrm{K} p$; fome defcribe it on a centre at the diflance of nine brims from the points $p$ and $K$; others, as it is done in the figure, on a centre at the difance only of feven brims from thofe points. Eut it is necellary firl? to find the 1 pint $p$, and to determine the rounding of

## F O U $\quad i 4 . i \quad 1 \quad 0$

3oandery the boll pI．For this purpore，on the fuint $\mathcal{C}$ as a rentre，and with the radius $C$ i，deforibe the are $1 p n$ ； bifect the part i， 2 of the line D ：t，and eactang the perpendicular $s m$ ，this perpendicular will cut the are 1 p $n$ in $n$ ，which terminates the rounding i $\%$ ．Some founders mate the bendings i a third of a brim lover Gian the middle of the line DN ；viluers make the pat C I D more actte，and inteat ot making C I perpendi－ cular to DN at 1 ，draw it $\frac{1}{6}$ th of a boim higher，making it fill equal to one brim；to that the line 1 I ）is longer than the bxim C＇i．In order to trace out ihe top pat $\mathrm{N} a$ ，take in the compals eight divitions of the feale or eight brims，and on the points N and D as centrec， detcribe arcs to interfect each other in 8：on this point 8 ，with a radius of eight brims，dcferibe the arc $\mathcal{N} b$ ； this arc will be the exterior curve of the top or crown ： on the fame point 8 as a centre，and with a radius equal to $7 \frac{2}{3}$ brims，defcribe the arc $\mathrm{A} c$ ，and this will be the interior curve of the crown，and its whole thichnefs will be one third of the brim．As the point 8 does not fall in the axis of the bell，a centre M may be found in the axis by defcribing，with the interval of eight brims on the centres D and H ，arcs which will interfect in M ；and this point may be made the centre of the inner and outer curses of the crown as before．The thicknefs of the cap which ftrengthens the crown at $(9$ is about one－third of the thickneis of the brim；and the hollow branches or ears about one liath of the diameter of the bell．The height of the bell is in ploportion to its diameter as 12 to 19 ，or in the proportion of the fundamental fund to its third major：whence it follows，that the found of a bell is priticipally compofed of the found of its catremity or brim as a fundamental，of the found of the crown which is an octave to it，and of that of the beight which is a third．

The particulars necetlary for making the mould of a bell are， I ．The earth ：the molt cohetive is the betl； it mul？be well ground and fifted，to prevent any chir！－ 2．Brick tone；which mult be ufed for the mine， mould，or core，and for the furnace．3．Horfe dung， hair，and hemp，mixed with the earth，to render the cement more binding．4．The wax for inferiptions， coats of arm，\＆ec．5．The tallow equally mixed with the was，in order to put a slight lay of it upon the outer mould，before any letters ：are appiicd to it．6．The conls to dry the mould．

For making the mould，they have a faffold con－ fiting of four boards ranged upon trefiels．Upon this they carry the earth，grofly diluted，to mix it with horfe du：g，beating the whole with a large fat tula．

The companes of confruction is the chic：influ－ ment for maling the mould，which confint of two dif－ terent legs joined by a third piece．And，latt of all the tombers thelues，on which are the agravings of Ast letters，castidges，cuats of arms，N．C．

They firt dig a ho！e of a difticient depth to contain the mould of the bell，together with the cale or canl－ ：on under ground；and about fix inches lower than the teraphain，where the work is performed．＇1li． hale must be wide enough ifr a frec pritige beeneter the morld and walle of the hoke，or beta，en one mou＇！ and inuther，whea feceal i，ös ore to lec cati．it

 matifun：The tais of the mowit are，the wite，the molel of the beil，and the thetl．Whe：bla water lur－ fore of the core if furm the they to taie the core， which is made of bricks that are lath in courles of uqual height umon a lay of plain cart？．At the layize of each brick，they bring near it the branch of the com－ panies，on which the curve of the core is thaped，fo as that there may remain between it and he conve the ditance of a line，to be afterwords villud up with layers of cement．The work is continued to the top，only leaving an opening for the coals to bake the cort．This work is covered with a laver of cement，mace of earth and horfe dung；on which they move the companies of contruction，to make it of an even fmoothnets crery－ where．

The fixt layer being finilhed，they put the fite to the core，by filing it haif with coak，thrusht an open－ ing that is kept thut，during the baking，with a cake of earth that has been teparately baked．The frit fire confumes the itake，and the fire is left in the core half or fometimes a whole day：the firt layer biog thoroughly dry，they cover it with a fecond，third， and fourth；each beins moothed by the bond of the complies，and thoroughly dried before they proceed to another．

The core being completed，they take the compaties to pieces，with intent to cut off the thicknefs of the model，and the compafles are immedintely put in theit place to begin a lecond piece of the mould．It cun－ tiths of a minture of earth and hair，aplied with tit land on the core，in fereral cakes that clofe togethe：． This work is finilied by feveral layers of a thimes cement of the fome matter，fmoothed by the compalic， and thoroughly dried before another is liid on．Tace futt layer of the model is a mixture of nax and srene fread over the whole．Atier which are applied the inderiptions，coats of arms，\＆c．befmencl with a per－ cil dipped in a vellel of wav in a chating dith：this is done for every letter．Beture the theil is beerun，the comparies are taken to piece，to cut oif all the wont that fllls the place of the the hoefs to be given to the thell．

The firlt laver is the fame earth with the reft，fified very fine：while it i－tempering in water，it is misel with cows hair to make it conere．The whole being a thin cullis，is gently poured on the model，that fills cvactly all the fituolities of the figura，die，and this is repeated till the whole is two hine thick over the model．When this laser is thorowhly hied，they cover it with a fecond of the lame matier，but fome－ what thicher；when this fecond tyer beeomes of tome comitence，they anfly the compalo again，and light a fee is the core fo an tomath of the was of the in－ Finutions，\＆C．

Ifer this，they go on with other layers of the thent． Iy weans of the rompafies．Here they add to the （i）whir at quantity of homp，tprad apen the losers． ：2n 1 ancranais lancothed by the board of the com－

 urrourd, it euite cloii, which prevents the eatratation of the riet.al. 'I he was thould be takon out before the meris of the metal.

The ear of the hell requires a feparate work, which is done during the drying of the feveral incruftations ut the cement. It has feven nings : the leventh is calied the bridge, and unites the others, being a perpendicuiar fuycet to fromgthen the curves. It bas an arerture at the top, to aumit a large iron yes, bent at te fottom; and this is insreduced into two boles in t'e beam, faftened with two strone iron keys. There cor made's maice of the rings, with malles of beaten cort', that are dried in the fire in order to have the $\therefore$ live of them. Thefe rings are genty prefted upon : leyer of tarin ard coms hair, one hall of its depth; aI ther taken out, without breaking the mould. Ihis operation is repeated 12 times for 12 half moulds, -hat two and two united may make the hollows of the .A rings : the fame they do for the hollow of the bridge, wad bake them all to unite them together.

Ufor the open place left for the coals to be fut in se thed the rings that conititute the ear. They firit ya into this open place the iron ring to fupport the $\therefore$ pou of the beil; then they make a round cake of Ahe, to illl up the diameter of the thicknefs of the core. This cake, after baking, is clapt upon the opening, and foldered with a thim mortar fpread over tt, which binds the cuver clofe to the core.

The hollow of the model is flled with an earth, fuficiently moit to fix on the place, which is itrewed at feveral time upon the cover of the core; and they beat it gently with a peftle, to a proper height ; and a workman fmooths the earth at top with a wooden zowel dipped in water.

Upon this cover, to be taken off afterwards, they ariemble the hollows of the rings. When every thing is in its proper place, they itrengthen the outfide of the hollows with mortar, in order to bind them with the bridge, and keep them teady at the bottom, by means of a cake of the fame mortar, which fills up the whole aperture of the thell. This they let dry, that it may te removed without breaking. To make room for the metal, they pull of the hollows of the rings, through which the metal is so pars, before it enters into the vaenity of the moull. The fhell being unloaded of its Fr, they range under the millitone five or fix pieces of wood, about two feet long, and thick enough to riach almof the lower part of the fhell; between thefe and the mould, they drive in wooden wedges with a mallet, to thake the theil of the model whereon it refts, So as to be pulled up and got out of the pit.

When this and the wax are removed, they break tho model and the layer of earth, through which the metal mult run, from the hollow of the rings, between the fhell and the core. They fmoke the inide of the fhell, by burning Itraw under it, that helps to fmooth the furface of the bell. Then they put the fleell in ti.e place, fo as to leave the fame interval between that and the core; and before the hollows of the rings or the cap are put on again, they add two vents, that are wited to the ri:ags, and to each other, by a mafs of buked coment. After which they put ua this mats of
the cap, the riscs, and the vent, over the Rhell, and Foundery. GHer it wih thin cement, which is dried gradually by covcring it with burning coals. Then they fill up the pit with earth, beating it itrongly all the time round the mould.

The furmace has a place for the fire, and another for the metal. The fire-place has a large chimney with a fpacious afh-hole. The furnace which contains the metal is vaulted, whofe bottom is made of earth, rammed down; the reft is built with brick. It has four apertures; the firit, through which the flame revibrates; the lecond is clofed with a tiopple that is opened for the metal to run; the others are to feparate the drofs or fcorize of the metal by wooden rakes: through thefe laft apertures paffes the thick fmone. The ground of the furnace is built lloping, fur the metal to run down.

Foundeky of Creat Guns and Mortar Pizces. The method of cating thefe pieces is litt'e different from that of bells; they are run mafy, without any core, being determined by the bollow of the the li; and they are afterwards bored with a ikeel trepan, that is worked cither by horfes or a water mill.

For the metal, parts, proportions, \&c. of thefe pieces, fee Gunnery.

Letter Fuundert, or Cafing of Printing Letters.
In the buinefs of cutting, calting, \&c. letters for printing, the letter-cutter mult be provided with a vice, hand-vice, hammers, and files of all forts for watchmakers ufe ; as alfo gravers and foulpters of all forts, and an oil ftone, \&c. fuitable and lizeable to the feveral letters to be cut : a flat gage made of box to hold a rod of fteel, or the body of a mould, \&c. exactly perpendicular to the flat of the ufing fle: a liding gage, whofe ufe is to meafure and let off dillances between the fhoulder and the tooth, and to makk it off from the end, or from the edge of the work; a face gage, which is a \{quare notch cut with a file into the edge of a thin plate of tteel, iron, or brafs, of the thicknels of a piece of common tin, whofe ufe is to proportion the face of each fort of letter, viz. long letters, afcending letters, and thort letters. So there mult be three gages; and the gage for the long letters is the length of the whole body fuppofed to be divided into 42 equal parts. The gage for the afcending letters Roman and Italic are $\frac{5}{4}$, or 30 parts of 42 , and 33 parts for the Engliih face. The gage for the fhort letters is $\frac{3}{3}$, or 18 parts of 42 of the whole body for the Roman and Italic, and 22 parts for the Englifh face.

The Italic and other ftanding gages are to meafure the fcope of the Italic items, by applying the top and bottom of the gage to the top and bottom lines of the letters, and the other lide of the gage to the ftem: for when the letter complies with thede three fides of the gage, that letter has its true fhape.

The next care of the letter-cutter is to prepare good fteel punches, well tempered, and quite free from all veins of iron; on the face of which he draws or marks the exact fhape of the letter with pen and ink if the letter be large, or with a fmooth blunted point of a needle if it be fmall; and then with fizeable and proper haped and pointed gravers and feulpters, digs or foulps out the deel between the floces or marks he made on the face of the punch, and leaves the mates
at ading

You dery fandine on the fiece Honing well bis pud ti... i: it ic ftrekes with letter, he deepens the hiton, with the farme tocls, for it a letter be not deen is yro, artion to its walth, it sill, when med at pret, petit hark, and be good for nothing. 1 his work i conest y regulated by the be:th of the counter-pund . Ihen he nor's the outide with proper fie tili it be tit for the n.atrice.

But before we proceed to the Ginking and juflifying of the natrices, we mat provide a mueld to jutity t.em by, of which there is a draught in Pl tit CCXXIli. t. . 1. 2.

Every mould is compofed of an uppez and an under part. The under part is delineated in fig. t. The upper part is morked fig. 2 . and is in all retpects made line the under part, exceptine the fool belind, and the ruw or foriaz all' betine; and evepting a fmall roandill wirc between the boty and ou-i -1, new the trak, where the under port buth a facil rambinc Eroore made in the body. 'Thiswire, or rather hatis wire, in the upper part makes the nick in the thank of the letter, when part of it is reccived i:to the croove in the under part. Thufe two parts are is evaetly ftted and gaged into one anthe: (viz. the mate gage marked $c$ in fir. 2. into the female morked gin fic. . . ), that when the unper part of the molld is properly placed on, and in the under part of the mouil, both to re. ther make the entire mould, and may be IIN back vards for ufe fo far, till the edse of either of tive bod'es on the middle of either earriage comes futt to the edge of the female gages eat in each carriace; and they may be lid formard fo far, till the bondies on either carriage tuach each other : and the fiding of thele tio pats of the mould backwards makes the thank of the letter thicker, beeaufe the bodies on each part dtand wider alunder; and the fliding them forward, makes the hank of the letter thinner, becaufe the bodies on each part of the mould ftand clofer tugether. The parts of the mould are as follow: viz. a, The carriage. b, The body. c, The male gage. de, The mouth-piece. fi , The regitter. g , The female gage. b, The hag, a $a$ a $a$, The bottom-plate. $b b l$, The woed on which the bottom-piate lies. $c c c$, The mouth. $d d$, The throat. edd, The pallat. $f$, The nick. $g s^{3}$, The ftool. $k$ h, The fpring or bow.

Then the mould mutt be jultifed: and firt the founder juftifies the body, by cafting about 20 proofs or famples of letters; which are fet up in a compofing itick, with all their nicks towards the right hand; and then by comparing thefe with the pattern letters, fet up in the fame manner, he finds the evact mealure of the body to be caft. He alfo tries if the two lides of the body are parallel, or that the body be no bigger at the head than at the foot, by taking half the number of his proofs and turning thens with their head to the feet of the other half; and if then the heads and the feet be found exactly even upon each other, and neither to drive out nor get in, the t:o fiden may be pronounced parallel. He father tries whether the two fides of the thicknefs of the letter he larallel, by firlt fetting bis proofs in the compofing iti, $k$ with their nicks upward, and then turning one-hit with their heads to the feet of the other half; and if tise heals and feet lie evactly upon each ctl.t., and t. cither drive

two mivdle f. .n $\because$ the other end of the wood ; and Fundury. frading the 1... and beeat lie in the under halt of
 it does', he thun's or tofles the letter, break and all, unon a thect of wathe pape: lat for that purpole on tiee bench, jud a little beyod his icit hand, and is then ready to calt ate ther hetter as before; and alfo, the whole number that is to be caft with that matrice. A workman will ordinarily cath about 3000 of thefe let. ters in a day.

When the cafters at the furnace have got a fufficient number of types uron the tatles, a fet of boys cone and nimbly break away the jets from them: the jets are throwin into the pots, and the types are carried away in parcels to other bere, who pals them fwiftly under their fingers, deferded by leather, upon fmooth flat flones, in order to polih their broadfides. This is a very dexterous operation, and is a remarkable inftance of what may be effectel by the power of habit and long pra.tice; for thete boys, in tuming up the other fide of the type, do it fo quickly by a mere touch of the fingers of the left hand, as not to require the lealt perceptible intermifion in the motion of the right hand upon the flone. The types, thus finely fmoothed and flattened on the broad lides, are next carried to another fet of boys, who fit at a fquare table, two on each fide, and there are ranged upon long rulers or flicks, fitted with a fmall projection, to hinder them from fliding off backwards. When thefe flicks are fo filled, they are placed, two and two, upon a fet of wooden pins fixed into the wall, near the dreffer, fometimes to the amount of an bundred, in order to undergo the finithing operations. This workman, who is always the moft expert and thilful in all the different branches carried on at the foundery, begins by taking one of thefe flicks, and, with a peculiar addrefs, flides the whole column of types off upon the dreffing-lick this is made of well-feafoned mahogany, and furnithed with two end-picces of ftcel, a little lower than the body of the types, one of which is moveable, fo as to approach the other by means of a long ferew-pin, inferted in the end of the flick. The types are put in. to the tilick with their faces next to the back or projection; and after they are adjufted to one another fo as to fland even, they are then bound up, by ferewing home the moveable end-piece. It is here where the great and requifite accuracy of the moulds comes to be perceived; for in this cafe the whole column, fo bound up, lies flat and true upon the llick, the two extreme types being quite parallel, and the whole has the appearance of one folid continuous plate of matal. The lealt inaccuracy in the exact parallelifm of the individuat type, when multiplied fo many times, wotild render it impolible to bind them up in this manner, by difpofing them to rife or furing from the flick by the fanallett prefine from the lcrew. Now, when lying fo conveniently with the narrow ciercuppermenl, which cannot pombly be fmoothed in the manter !. fore mentioned by the fones, the workman does this more effectually by feraping the furface of the column with a thick-edged but harp razor, "hich at every troke brings on a very line fmooth kim , like to polilhed filver: and tinus be procecds till in shout half a minute be comes to the farthes end of the fikik. The other efre

 Font. the fame maner. It is willt tictules than wic in the dreflingentick that the (weation of leardivg or barh). ing is furtorme?, whirh is effeted by roming a plane,
 to the face, whin whe more or lein of the comer, as occaion may rentite. Wh:la in the draing glick, they are io groowd, whinh is a rey mrerial operation. In order to maderland this, is mat be remembered, that when the types are fred beoten of from the gets, tome fug rixuon metal ahaso remain, which would male them bear yery uncquyly againt the paper whin winder the priating pret, and chectually mar the impreflion. That all the inequatities mey, therefore, be takea away, and that the healins of cyery type may be regulated by the floulders imararted to them all alike from the mould, the workman or dreffer proceels in the following manner: The types being fcrewed up in the llick, as before mentioned, with the jet end ontermot, anl projecting heyond the wood a'bout one-eighth of an inch, the fic! is putinto an open preti, fo as to proient the jet end uppermoll, and then every thing is made falt by driving a long welloc, which beers upon a ilip of woos, which hies chrie to the types the "hole length: then a plough or pleme is applied, which is fo conttueted as to cmbrace the proiecting part of the types betwist its long fide, which are made of polithed iron. When the plane is thus applied, the tleel cutter bearing upon that part between the iboulders of the types, where the inequalities lie, the drefler dexteroully glides it along, and by this means ftrips off every ieregular part that comes in the way, and fo makes an uniform groove the whole length, and leaves the two thouklers itanding; by which means every type becomes precifly like to another, as to the height againt paper. The types being now finithed, the tlick is takea out of the prefs, and the whole columa replaced apon the other hick; and after the whole are to drented, he proceeds to pich out the bad letters, previous to puttion the n up in's pages and paper. In doing this he takes the fit $\boldsymbol{l}^{2}$ into his left hand, and turning the fices tear to the light, he examines them cavefuly, and whenever an imperfect or damaged letter orcus, h. nimbly plucks it out with a tharp bodhin, whicl: he hold in the ripht hand for that purpofe. Thoe leter, waich, from their form, project over the body of the type, and which cannot on this account be rabled of the itrec, are feraped on the broadides with a knite or the, and fons of the metal next the face pared any wih a peaknite, in orler to allow the type to come clole to any other. This operation is called farms.

The eveallence of prinisig typer contial mot only in the due performance of ill the ofation abme doferibed, but alfo in the hardnef of the ratel, foom, and fine pronortion of the charazer, whed in the ewact bearing and ranging of the letter, iar reation to one anollor.

 : ! !a:c ivect given it on accuurt of its yielding much Water, for in that refpect it hardly delerves the name of a fountain. More to the northwad is anotlear called $H_{i *}{ }^{\circ}$; ; and ia the middle of the illand is a fprivg, yelling a firem about the thiclacts of a manc finger. Thin hut wos dikover in the your 156 : and is callai tie fimman of simen. Hernader. On accome of the fan ity of water, the theep, goat, and lime, Lese do nut drink in the fimmer, but ase tuught to digg up the ronts of ferm, and chear them to quench their thirs. The great cattle are watered at thofe fountains, and at a place whe wat r diliths from the leaves of a t.ee. Nluy writers have mate mention of this famuas tree, fome in fuch a manner as to make it appear minaculous: others a ain deny the exiftence of any fuch tree: among whom is Father Feyjon, a modorn Spanid, author, in his Thentro Criticn. But he, stu! thofe w!n arse with him in this matter, are as puch nilliken as thole who wond make it appear to te misenk. 'This is the only iland of all the Camalos which I have not been in ; bus I have fale d with native of Hierro, who, when quationed about the exillence of this tree, anfwered in the affirmative." The author of the IIffory of the difcovery and confuce? hav given us a particular account of it, which I Alall here relate at large.
" The ditrict in which this tree ftands is called $T_{i}$. sulale; near to which, and in the cliff or fteep rocky afcent that furrounds the whole ifland, is a narrow gutter or gully, which commences at the fea, and continues to the fummit of the cliff, where it joins or coincides with a valley, which is terminated by the fteep front of a rock. On the top of this rock grows a tree, called in the language of the anci nt inhabitants, Garfe, "Sacred or Holy "lice," which for many years has been prefcrved found, entire, and freh. Its leaves confantly diftil fuch a quantity of water as is fufficient to furnith drink to every living creature in Hierro; nature having provided this remedy for the drought of the illand. It is fituated about a league and a half from the fea. It is not certainly known of what fpecies it is, only that it is called Til. It is dininct from other trees, and ftands ty itfelf; the circumserence of the trunk is about 12 pans, the diameter four, and in height, from the ground to the top of the higheft branch, $4^{\circ}$ frans: the circumference of all the branches together i. 125 fett. The branches are thick and extended; the lowelt commence about the height of an ell from the ground. Its fruit refembles the acorn, and taftes fumething like the kernel of a pine apple, but is fofter and more armatic. The leaves of this tree refemble thofe of the laure', but are larger, wider, and more curved; they come forth, in a perpetual fucceflion, fo that the tree always remint green. Near to it grows a them which it fattens on many of its branches, and intrreaves with them; and at a fimall diftance from the cafe are fome beech trees, brefis, and thoms. On the tarth fiar of the trunk are two large tanks or cifterns, (f rrough flore, or rather one ciftern divided, each half being 20 feet fquare, and 16 foans in depth. One of thefe cratains water for the drinking of the inhabitan: and the cther that which they ufe for their c.ittle, walhing, and fuch like purpofes Every morning, utar this part of the ibland, a cloud or mift arifes frose the fea, which the fouth and eatterly winds force
aginft the fore-mentioned fleep cliff; fo that the ciond Fometain. having no vent but by the gutter, gradually afcends it, and from thence alvances llowly to the extremity of the valley, where it is ftopped and checked by the front of the rock which terminates the valley, and then rells upon the thick leaves and wide-fpreading branches of the tree, from whence it diftils in drops during the reminder of the day, until it is at length exhaulted, in the lame mancer that we fee water drip from the leaves of trees after a heavy fhower of rain. This dilillation is not peculiar to the garfe or til ; for the brefos, which grow near it, likewife drop water; but their leaves being but few and narrow, the quantity is fo trifling, that though the natives fave fome of it, yet they make little or no account of any but what diitils from the til, which, together with the water of fome fountains, and what is faved in the winter feafon, is fufficient to ferve them and their flocks. This tree yields moft water in thofe years when the Levant or talterly wints have prevailed for a continuance; for, by thaie vinds only the clouds or mifts are drawn hither from the fea. A perfon lives on the fpot near which this tree grows, who is appointed by the council to take care of it and its water ; and is allowed a houfe to live in, with a certain falary. He every day diftributes to each family of the diltrict feven pots or veffels full of water, befides what he gives to the principal people of the ifland."
" Whether the tree which yields water at this prefent time be the fame as that mentioned in the above defcription, I cannot pretend to determine : but it is probable there has been a fucceffion of them; for Pliny, defcribing the Fortunate iflands, fays, "In the nountains of Ombrion are trees refembling the plant ferula, from which water may be procured by preffure. What comes from the black kind is bitter, but that which the white yields is fweet and potable."

Trees yielding water are not peculiar to the inland of Hierro ; for travellers inform us of one of the fame kind in the ifland of St Thomas, in the bight or gulf of Guinca. In Cockburn's voyages we find the following account of a dropping tree, near the mountains of Vera Paz , in America.
" On the morning of the fourth day, we came out on a large plain, where were great numbers of fine deer, and in the middle flood a tree of unufual fize, fpreading its branches over a valt compafs of ground. Curiofity led us up to it. We had perceived, at fome diftance off, the ground about it to be wet; at which we began to be fomewhat furprifed, as well knowing there had no rain fallen for near fix months paft, according to the certain courfe of the faton in that latitude: that it was impoffible to be occafioned by the fall of dew on the tree, we were convinced, by the fun's having power to exhale away all moifture of that nature a few minutes after its rifing. At latl, to our great amazement as well as joy, we faw water dropping, or as it were diftilling, falt from the end of every leaf of this wondcrful (nor had it been amils if I had faid miraculour) tree; at leaft it was fo with refpect to us, who had been labouring four days through extreme heat, without receiving the leatt moisure, and were now almott expiring for want of it.
"We could not help looling on this as liquor fent from heaven to comfort us under great extremity. We

## F G U

Fcuquieres catched what we could of it in our hands, and drank Fournefs very plentifully of it; and liked it fo well, that we could hardly prevail with ourfelves to give over. A matter of this nature could not but incite us to make the ftricteft obfervations concerning it ; and accordingly we itaid under the tree near three hours, and found we could not fathom its body in five times. We obferved the foil where it grew to be very Itrong; and upon the niceit inquiry we could afterwards make, both of the natives of the country and the Spanift inhabitants, we could not learn there was any fuch tree known throughout New Spain, nor perhaps all America over : but I do not relate this as a prodigy in nature, becaufe I am not a philofopher enough to defcribe any natural caufe for it ; the learned may perhaps give fubftantial reafons in nature for what appeared to us a great and marvellous fecret."

FOUQUIERES, James, an eminent painter, was born at Antwerp in 1580 , and received his chief inflructions from Velvet Breughel. He applied himfelf to the itudy of landfeapes, and went to Italy to improve himfelf in colouring. He fucceeded fo happily, that his works are faid to be nearly equal to thofe of Titian.-He was engaged and much carefled at the court of the elector Palatine, and afterwards fpent feseral years of his life in France; where his works met with univerfal approbation. By fome mifconduct, however, he funk into poverty, and died in 1659 in the houfe of an inconfiderable painter. He had refided for feveral years at Rome and Venice, where he acquired that excellent flyle of colouring and defign for which his works have been defervedly diftinguifhed.

FOURCHEE, or Fourchy, in Heraldry, an appellation given to a crofs forked at the end. See Heraldry.

FOURMONT, Stffhen, profefor of the Arabic and Chinefe languages, and one of the moft learned men of his time, was born at Herbelai, a village four leagues from Paris, in 1683. He ftudied in Mazarine college, and afterwards in the Seminary of Thirtythree. He was at length profefor of Arabic in the Royal College, and was made a member of the Academy of Infcriptions. In 1738 he was chofen a member of the Royal Socitty of London, and of that of Berlin in 174 r . He was often confulted by the duke of Orleans, firft prince of the blood; who had a particular efteem for him, and made him one of his fecretaries. He wrote a great number of books; the moft confiderable of thofe which have been printed are, 1. The Roots of the Latin Tongue, in verie. 2. Critical Reflections on the Hiltories of ancient Nations, 2 vols. 4to. 3. Meditationes Sinice, folio. 4. A Chinefe Grammar, in Latin, folio. 5. Several differtations printed in the Memoirs of the Academy of Inferiptions, \&c. He died at Paris in $174+$

He ought not to be confounded with Mickael Fourmont, his youngeit brother; who took orders, was profeflor of the Syriac language in the Royal College, and a member of the Academy of Infcriptions. He died in 1746 .

FOURNESS, in Loynfdale, Lancallire, is a tract, between the Kent, Leven, and Dudden-fards, which zams north parallel with the welt fides of Cumberland and Weflmorland; and on the fouth rans out into Von. IX. Part I.
the fea as a promontory. Here, as Mr Camben ex- Tu-h prefles it, " the fea, as if enraged at it, lanke it more turiounly, and in high tides has evendevoured the fhore, and made three large bay; ; vi九. Kentfand, into which the river Ken empties iffelf; Levenfand and Duddenfand, between which the land projects in iuch a man ner that it has its name hence; Forenef and loreland, fignifying the fame with us as promontorium antcius in Latin." Bihop Gibfon, however, derives the name of Fournefs or Furnefs, from the numerous fursaces that were there anciently, the rents and icrvices of which (called Bloom/mithy rents) are it lll paid. This whole tract, except on the coaft, rifcs in high hills and valt piles of rocks called Furnc/s-Fc!ls; among which the Britons found a fecure retreat, trufting to thel'c natural fortrefles, though nothing was inaccelfible to the victorious Saxons; for we find the Britons fettled here 228 years after the arrival of the Saxons : becaufe at that time Egfrid king of Northumberland gave St Cuthbert the land called carthmell, and all the Britons in it, as is related in his life. In thefe mountainous parts are found quarries of a fine durable blue flate to cover buildings with, which are made wle of in many other parts of the kingdom. Here are feveral cotton mills lately erected; and if fuel for fire were more plentiful, the trade of this country would much increafe: but there being no coals nearer than Wigan or Whitehaven, and the coalt daties high, firing is rather fearce, the country people ufing only turf or peat, and that begins to be more fance than formerly. In the moffes of Founnefs mouch fir is found, but more oak: the trunks in general lie with their heads to the eaft, the high winds having been frem the weft. High Furnefs has ever had great quantities of theep, which browfe upon the hollies left in great numbers for them; and produces chareoal for melting iron ore, and oak bark for tanners ufe, in great abundance. The forcts abound with dcer and wild boars, and the legh or $f c c f e$, or large flags, whofe horms are frequently found underground here. The low or plain part of Fournefs, which is fo called to diftinguith it from the woody or mountainous part, prodnces all forts of grain, but principally oats, whereof the bread eaten in this country is generally made; and there are found here veins of a very rich iron ore, which is not only melted and wrought here, but great quantitics are exported to other parts to mix with poorer ores. The three fands above mentioned are very dangerous to travellers, by the tides and the many quickiands. There is a guide on horfeback appointed to Kent or Lancafter i.nds at 101. per ann. to Leven at 61. per anm. ont of the publie revenue; but to Dudden, which are molt dangerous, none ; and it is no uncommon thing for perfuns to pafs over in parties of 100 at a time like caravans, under the direction of the carriers, who go to or fro every day. The fands are lefs dangerous than formerly, being more ufed and better known, and travellers never going without the carriers or guides. "Furnis abbey up in the monntains," was begun at Tulket in Amoundernefs 1124, by Stephen carl of Bualozne: afterwards king of f.ngland, for the monks of Savigni in France, and three years after rewoved to this valley, then called Bekangefyill, or, " the valc of nighthade." It was e? the Cittertian order, endowed with (i

Fourth above Secl. far amn. Oat of the moahs of this abber, Mr Camden informs us, the bilhops of the Ihe of Man, which lies over asainl it, ufed to be chofen by ancient culton; it being as it were the mother of many nonateries in Man and Ireland. Some ruins, and part of the folfe which furrounded the monaltery, ate illll to be feen at Tulket. The remains at Founnel, breatlie thit plain Amplicity of the Citertion abbeys; the chanter-houfe was the only piece of elegant Gothic ribout it, and its roof has lately fallen in. Part of the painted glats from the eaft winlow, repreining the crucifion, $\varepsilon$ ec. is proferved at Wiadermere chuch in Fowlnefs, Wetlmorland. The church (except the north side of the nave), the chapter-houfe, refectory, \&ic. remain, on'ly unroofed.

FOURTHReduadmi, ia Mu/tc. See Intenval.
FOWEI, or Foy, a town of Comwall in England, $2 \ddagger 2$ miles from Londun, with a commodious haven ois the Channcl. It is a populows place, extending above one mite on the caft ade of a rive of its own nome; ard has a graat fare in the flhing takle, efpeciatly pilk have. It rose fo much fomenly by moval wats and fracies, that in the reign of Edward III. its hips refufing to titike when required as they failed by Rye and Winchelfea, were attached by the thing of thole porn, Bat defeated them; whercupon they bore the ir anmin mixed with the arms of thome two cingue-purt, which gave rife to the name of the "Gilints of Fowey." And we learn from Camlen, that this town quartered a part of the arms of every one of the cinque ports wi:h their own; intimating, that they had at times trium, hed over then all: and indeed once they were fo powerful, that they took feverd of the French men of war. In the reign of Ldward III. they refcued certain ihips of Rye from diltrefs, for which this town was made a momber of the cinque-ports. Edward IV. favoured Fuwey fo much, that when the French tereatened to conse up the river to bum it, he caufed two towers, the ruins of which are yet vinble, to be built at the public charge for its fecurity : but he was riterwards fo difguled with the inhabitants for attacking the Freach after a truce prochaimed with Louis XI. that he took away all their hips and naval flores, together with a chain drawn acrof the river betwee: the ino dorts above mentioned, which was carried to Darimwath. It is faid they were fo infolent, that they cut off the ears of the hing's purfuivants; for which fome Bie were furfeiced as well as eftates. The corporation connite of a mayor. recorder, 8 aldemen, a town clerk, ard 2 afifants. The market is on Saturday, the fats May-day and Sept. 12. Here are a tine ohl church, a free fchool, and an hofpital. The toll of the market and fains, and keyage of the harbone, were vented in the corporation on the pament of a fee-farm rent of sbout 4 fs. It does not apetar to have fent members to partiament before the 13 h of Oucen Elizabeth. Here is a comage for the tin; of which a great quanrity is dug in the country to the marth and veft of it. The river Foy, or Foath, i, very broad and deep here, and was formerly navigable as nigin as Lellwithicl. W. Long. $5^{\circ}$. N. Latt. 52.27.

FOW $L$, mong zoologitls, denotes the largor forts of birds, whether domettic or wild: fuch as geefe, plenfanss, partrideses, turkeys, durlis, \&e.

Tame fowl make a neceffary part of the nock of a country farm. See Pocletri.

Fowls are agsin diftinguinted into two kinds, viz. land and suater fowl, theie latt being fo called from t'reir living much in and about water : alfo into thofe which are accounted game, and thofe which are not. See Gime.

FOWLING, the ast of catching birds by mcans of bird-lime, decoys, and other devices, or the killing of them by the gun. See Bird-Catching, Bikb-Lime, Decor, shooting, and the names of the different birds in the order of the a!phabet.

Fowling, is alio ufed for the purfuing and taking birds with hawks, more properly called falcowry or hawking. See thede articles.

Fumbing Pitce, a light gun for mouting birds, Tha: picce is alway reckoned bett which has the longell barrel, from $5^{\frac{7}{2}}$ to 6 feet, with a moderate bore; ihough every fowier fhould have thera of difierent fizes, fuitable to the game he detigns to kill. The barre? thould be well polified and imooth within, and the bore of an equal bignefs from one end to the other; which may be proved, by putting in a piece of patteboard, cut of the exact roundnefs of the top: for if this goes dorn without itops or mipping, you may conclude the bore good. The bridge-pan mut be fomewhat arove the touch-hole, and ou tht to have a notch. to let down a little powder: this will prevent the piece from recoiling, which it would otherwife be apt to do. As to the locks, choole fuch as are well alled with true work, whole frings mut be neither too itrong nor too weak. The hammer ought to be well hardened, and plable to go down to the pan with a quick motion.

FOX, in Zabogy. See Canis, Mimmama Inder.
The fox is a great nuifance to the humandman, by taking away and delfoying his lambs, geef, poulty, \&c. The common way to catch him is by gim; which being baited, and a train made by drawing raw fieth acrofs in his ufual paths or haunts to the gin, it proves an inducement to bring him to the place of deifruction.

The fox is alfo a beafl of chafe, and is taken with greghounds, terriers, \&c. See Hentriac.

Fox, John, the martyrologit, was born at Bofon in Lincolbthize in the year 1517 . At the age of 16 be was entered a itudent of Brazen-Nofe col'ege in Oxford; and in 1543 he proceeded matter of arte, a" l was chofen fcllow of Magdalen college. He difcovered an errly genius for poctry, and wrote feveral Latin comedice, the fubjeats taken from Scripture, which his foa affurcs us were written in an clegant etve. Forfaking the mufer, he now applied hialelf with uncommon afiduity to the thudy of eivinity, paticularly church-hiflory; and, difcovering a prematare propeafity to the doctrine of reformation, he was expelled the collese as an heretic. His difires on this occaion was very great; but it was not lons before he fond an afylum in the houte of Sir Thomas Lucy of W:arnickdire, who employed him as a tutor to hi, childron. Here he married the daughter of a citizen of Coventry. Sir 'Thomas's children being now grown up, after refiding a thort time with his wifes futher, be canie to London; where finding no immediate means of fubfitence, he was redaced to the utmot degree of want ; but was at length

 fhathat and the weltran roat of the conibest of America. Wach itland lat- a perticular ame; lue the general name Fax-lhand is given in the shole wriof, on account of the grest mamber of l!eck, an, an fed foxes with which they atround. The ar if the in habitants confils of a cap, and a fur cons whic? wowhe down to the knet. Some of then. wear comave cin of a party-coloured bird fin, umm which $t$. 5 , . pat of the wings and tail. Oa the fore part of theor hunting and firhing caps, they place a fmill board tin a freen, adomed with the jaw oones of fa bears, an omamented with glafs beads, which they receiv. in barter from the Ruthans. At their feltival; an! dancing partics they ule :a much more thowy fort of cap. They feed upon the fleth of all forts of fea mamat. and generally eat it raw. But if at any time hey choofe to drefi their viculs, they make ule of a hollow itone; having placed thee fih or fieth therein, they cover it with anoher, and clole the inteatices with lime or clay. They then lay it horizontaly upon two ftones, and light a fire under it. Ine provition intended for keeping is dried without hat in the open air. Their weapons confit of bows, arrows, and darts; and for defence they ufe wooden hields. The mott perfect equality reign among thele illanders. They have neither chiefs nor fuperiors, neither laws nor punifments. They live together in families, and focieties of feveral families united, which form what they call a race, who, in cafe of an artack or detence, nutually help and fupport each other. The inhabitants of the fame illand always pretend to be of the fame race; and every perfon looks upon his ifland as a poffeffion, the property of which is common to all the individuals of the lame fociety. Feafts are very common among them, ard more particularly when the iuhabitants of one itla: 1 are vifited by thofe of the others. The men of the village meet their guefts beating drums, and preceded by the nomen, who fing and dance. It the conrles fion of the dance, the hohs ferve up their bett protifions, and invite their guefts to partake of the fealt. They feed their children when very goung with the coartelt them, and for the most pant ravi. If an infant rive, the mother immediately carrics it to the te. ride, and whether it be fummer or winter, luolds is naked is the water until it is quiet. This cultom i fo far from doing the chiidren any harm, thet it hardens t'lem aysaint the cold, and they according'y go barefooted through the winter without the lent inconvenience. They feldom heat their dwellinge; but when they are deforon of warming themblie, they light a bandle of hay, and fand over it; or elfe they fet fire to train-oil, which they pour into a bollow fone. They have a grood fhate of plain matural fente, but are rather ilow of underitanding. They feem cold and indiferent in moft of their ations; but let am injury, or even a fufpicion only, roufe them from this phlegmatic itate, and they become intlevible and furious, tahing the moit violent revenge without any regard to the confequences. The katt a hliclim prompts them to fuicide; the apprehention of even an uncertain cuil often leads them to defanir; ant G 2
the:

Fracalor they put an end to their days with great apparent inIt Fisttion. fenfibility.
FRACASTOR, Jeromf, an eminent Italian poet and phyfician, was born at Verona in the year 1482. Two lingularities are related of him in his infancy: one is, that his lip ${ }^{5}$, adhered fo clufly to each other when he came into the world, that a furgeon was ubliged to divide them with his incilion knife; the other, that lis mother was killed with lightning, while he, though in her arms at the very moment, efcaped unhurt. Fracaftor was of parts lo expuiiite, and made fuch progrefs in every thing he undertook, that he became eminently fkilled not only in the belles lettres, but in all arts and ficience. He was a poet, a philofopher, a phyfician, an aftrononer, and a mathematician. He was a man of valt conferuence in his time; as appears from Pupe Paul 11I's making ufe of his authority to remove the council of Trent to Boulugne, under the pretext of a contagious diftemper, which, as Fracafor depofed, made it no longer fafe to continue at Trent. He was intimately acquainted with Cardinal Bembus, Julius Scaliser, and all the great men of his time. He died of an apoplexy at Cafi hear Verona, in 1553 : and in 1559 , the town of Verona erected a itatue in honour of him.

He was the author of many performances, both as a foet and as a phyfician : yet never man was more difinterefted in both thefe capacities than he: evidently fo as a phyfician, for he practifed without fees; and as a poet, whofe ufual reward is glory, nothing could be more indifferent. It is owing to this indifference, that we have fo little of his poetry, in comparifon of what he wrote; and that, among other compofitions, his Odes and Epigrams, which were read in manufcript with infinite admiration, yet, never paffing the prefs, were loft. What we have now of his, are the three books of "Siphilis, or of the French difeafe;" a book of Mifcellaneous Puems; and two books of his poem, entitled, $\mathcal{H} \notint f \int_{i p h}$, which he began at the latter end of his life, but did not live to finith. And thefe works, it is faid, would have perifhed with the reft, if his friends had not taken care to preferve and communicate copies of them: For Fracaftor, writing merely fur amufement, never troubled himfelf in the leaft about what became of his works after they once got out of his hands. Fracaitor compofed alfo a poem, called Alcon, five de cura canum venaticorum. His poems as well as his other works are all written in Latin. His medical pieces are, De Sympathia ct Ansipathia, - De contagicne et contagiofis morbis,-De cau/ss criticorum dicrum,-De vini tempcratura, \&c. His works have been printed feparately and collectively. The beft edition of them is that of Padua 1735 , in 2 vols, 4 to.

FRACHES, in the glafs trade, are the flat iron pans into which the glafs veffels already formed are put when in the tower over the working furnace, and by means of which they are drawn out through the leers, that they may be taken gradually from the fire, and cool by degrees.

FRACTION, in Arithmetic and Algebra, a part or diviiion of an unit or integer; or a number which ftands to an unit in the relation of a part to its whole. The word literally imports a broken number.

Fractions are ufually divided into decimal, fexa-
gefimal, and vuigar. See Algebra and Arrmime- Fracture 11 c.

FRACTURE, in Surgery, a rupture of a bone or a folution of continuity in a bone when it is crulhed or broken by fome external caufe. Sce Surgery Inde:.

TR ENUM, or FREvin, Brille, in Anatomy, * n ime given to divers ligamente, from their office in retaining and curbing the motions of the parts they are fitted to.

Fr.snom Linguc, or Bridle of the Tongue; a membranous liganent, which ties the tongue to the os hyoides, larynx, fauces, and lower parts of the mouth. In fome fubjects the fracnum runs the whole length of the tongue to the very tip; in which cafes, if it were not cut, it would take away all polibility of fpeech. See Tongue-Tied.

Frexuma Penis, a flender ligament, whereby the prepuce is tied to the lower part of the glans of the penis. Nature varies in the make of this part ; it being to fhort in fome, that unlefs divided it would nut admit of perfect erection. There is alio a kind of little fracnum, fattened to the lowcr part of the clitoris.
FRAGA, a flong town with a handiome caftle, i:1 the kingdom of Arragon in Spain. It is ftrong by fituation among the mountains; having the river Cinca before it, whofe high banks are difficult of accefs; and at its back a hill, which cannot eafily be approached with large cannon. Alphonfo Vil. king of Arragon, and the firtt of that name of Cattile, was killed by the Moors in 1134, when he betieged this town. E. Long. o. 23. N. Lat. 41. 28.

FRAGARIA, the STRAWBERRy, a genus of plants belonging to the icofandria clafs; and in the natural method ranking under the 35 th order, Senticofie. Sce Botany Index, and for an account of the varieties and culture, fee Gardening Index.

FR AIL, a baket made of ruihes or the like, in which are packed up figs, raiins, \&\&c. It fignifies alfo a certain quantity of raifins, about 75 pounds.

FRAISE, in Fortification, a kind of defence confifting of pointed ftakes, fix or feven feet long, driven parallel to the horizon into the retrenchments of a camp, a half moon, or the like, to prevent any approach or fcalade.
Fraifes differ from pallifades chiefly in this, that the latter ftand perpendicular to the horizon, and the former jet out parallel to the horizon, or nearly fo, being ufually made a little floping, or with the points hanging down. Fraifes are chiely ufed in retrenchments and other works thrown up of earth; fometimes they are found under the parapet of a rampart, ferving inItead of the cordon of ftone ufed in ftone works.

To Fraiss a Battalion, is to line the mufqueteers round with pikes, that in cafe they fhould be charged with a body of horfe, the pikes being prefented, may cover the mufqueteers from the fhock, and ferve as a barricade.

FRAME, in Yoinery, a kind of cafe, wherein a thing is fet or encloled, or even fupported; as a window frame, a picture frame, \&c.

Frame is alfo a machine ufed in divers arts; as,
Frame, among printers, is the itand which fupports the cafes. See Case.

Frame,

## $\mathrm{F} R \mathrm{~A} \quad[53$ ] $\quad \mathrm{B}$ A

Frame Frave, among founders, a kind of lui a enclofeng France. a board; which, being flled nith wetted fand, ferves is a mould to calt their works in. See Foncoral.

Frine is more particularly ufed for a fort of loom, whereon artificess ftetch their linems, filks, itufi, \&ic. to be embroidered, quil:ed, or the like.

Frour, ampog painters, a kind of fiuare, conflimg of four long thi"s of wood joined tonether, whofe intermediate fuace is divided by thresd, into feveral little tpuare, like a net ; and hence fometimes called retionla. It ferves to reduce figures from great to fimill ; or, on the contrary, to augment their ize from fmall to great.

FR.ATILINGHAM, a town of Suffex, 88 miles from London. It is a large old place, with a calle, fuppofed to have been built by fome of the firf kings of the Eaf Angles; the walls, yet itanding, are 4 ? feet hish, 8 thick, with 13 toweri $I_{+}+$feet above them, 2 of which are waich-towers. To this caftle the princefs, afterwards Queen Mary I. retired, when the Lady Jane Grey was her competitor for the crown. The town is pleafantly fituated, though but indifferently built, upon a clay hill, in a fruitful foil and healthy air, near the fource of the river Ore, by fome called Winckncl, which runs through it to Orford. It has a fpacious place for the market which is held on Saturday ; and a large itatelo church built all of black thint, with a itceple 100 feet high; two good almshoufes; and a free-fchool.

## FRANC. See Frank.

FRANCE, a large kingdom of Europe, fituated between $5^{\circ} \mathrm{W}$. and $7^{\circ}$ E. Long. and between $43^{\circ}$ and $51^{\circ} \mathrm{N}$. Lat. being bounded by the Enylihh channel and the Auftrian Netherlands on the north ; by Germany, Switzerland, Savoy, and Piedmont, in Italy, on the ealt ; by the Mediterranean fea, and the Pyrenean mountains, which feparate it from Spain, on the fouth; and by the bay of Bifcay on the weil.

The kingdom of Fratice was originally poffefed by the Celtes or Gauli. They were a very warlike people, and often checked the progrefs of the Roman arms: nor did they yield till the time of Julius Cafar, who totally fubdued their country, and reduced it to *See Gatl!.the form of a Roman province *. The Romans con. tinued in quiet poffeffion of Gaul, as long as their empire retained its ftrength, and they were in a condition to reprefs the incurfions of the German nations, whom even in the zenith of their power they had not been able to fubdue. But in the reign of the emperor Va lerian, the ancient Roman valour and difcipline had begun to decline, and the fame care was not taken to defend the provinces as formerly. The barbarous nations, therefore, began to make much more frequent incurfions; and among the reft the Franks, a German nation, inhabiting the banks of the Rhine, proved particularly troublefome. Their origin is varioully accounted for ; but the molt probable fuppofition is, that about the time of the emperor Gurdian, the people inhabiting the banks of the Lower Rlinee, entered into a confederacy with thofe who duelt on the Wefer, and both together affumed the name of Franks or Freemen. Their firlt irruption, we are told by Valefus, happened in the year 254, the fecond of Valerian's reign. At this time they were but few in number; and were repulfed by Aurelian, afterwards emperor.

Not dino ized $\vdots$ in $^{\prime \prime}$ : cects, they returned two years tifter in far atea.ar mombeth; but were agnia deffated by Gullientio, whon Vilerizn had chofen for his partues in the empise. ()t ers, however, continued to pour in fom their native country in fuch multitudec, that canlient, ne lonker able to drive them cut by furce of amm, mate adval ager us popofils to mee ot their chiefs, whom he elignesed to defond the finutier, agam his countrynen an well as other is. vadeie.

This expedient did not long anfwer the purpofe. In 260 the Frasks, taking advantage of the deficat and captivity of Valerian in Perfia, broke into Gau?, and afterwards into Italy, committing everywherc dieadtul ravges. Five years afterwards they invaded Sain; which they pofleled, or rather plundered, for the face of 12 years: nor could they be driven out of Gaul till the year 275 , when the emperor Probus rut only gave them a total overthrow in that country, but purfued them inte tiair own, where he built leveral forts to keep them in awe. This intimidated them fo much, that nine of their kings fubmitted to the ensperor and promifed an annual tribute.-They continued quiet till the year 287; when, in conjunction with the Saxon pirates, they plundered the coafts of Gaul, carrying off an immenfe booty. To revenge this infult, the emperor Maximian entered the country of the Franks the following year, where he committed fuch ravages that two of their kings fubmitted to him; and to mary of the cummon people who chofe to re* main in Gaul, he allowed lands in the neighbourhood of Treves and Cambray.

The reftlef, difpofition of the Franks, however, dit not allow them to remain long in quiet. About the year 293, they made themfelves mafters of Batavia and part of Flanders; but were entirely defeated, and forced to furrender at diicretion, by Conltantius the father of Conitantine the Grest, who tranflanted then into Gaul. Their countrymen in Germany continued quict till the year $3 \approx 6$, when they rencwed their depredations; but being overtaken by Confantine the Great, two of their kings were taken prifoners, and thrown to the wild beafts in the fhows exhibited on that occafion.

All thefe victories, however, as well as many other, faid to have been gained by the Romans, were not fufficient to prevent the incurfions of this reflecfs and turbulent nation: infomuch that, in the year 355, they had made themfelves mafters of 40 cities in the province of Ganl. Soon after, they were totally defeated by the emperor Julian, and again by Cuunt Thcodufius, father to the emperor of that name ; but in the year 388 , they ravaced the province with more fury than ever, and cut off a whole Roman army that wais fent againtt them. As the weltern empire was at this time in a very low ftate, they for fome time found more interruption from other barbarian than from the Romans, till their progrefs was checked by detilus.

When the war with Aetius broke ou:, the Frankspharumes were governed by one Pharamand, the linit of their he tir : kings of whon we have any ditinct account. He is kir.b. fuppofed to have reigned from the year +17 or +18 , to 428 ; and is thought by Archbillop Wher to have been killed in the war with Sectio By fome be is

mans, made a powerful defence againft the bartarial:s

Fratie. furpofed to have compiled the S.lic laws, with the

 Fonhs had no written laws till the time of Clovis.
Elodio
Tharamond was fucceceded by his fon Clodio, who lil. crife carried on a war agsainit the Romans. He is frid to have tcceived a terible overhrow from Actius near the city of Lens; netwithltanding which, be adranced to Cambray, and made himiclf mafier of that city, where for fome time he took up bis refidence. After this he extended his conquelts as far as the river Sorme, and deftroyed the cities of Treves and Cologne, Tournay and Amiens. -He died in the year 44 ${ }^{\text {S }}$, and was fucceeded by Merovius.
Authors are not agreed whethe: the new king was brother, or fon, or any relation at all, to Clodio. It feems probable indeed, that he was of a different family; as from him the filf race of French kings were ytvicd Mervuirgian. He was honoured and reipeced by his people, but did not greatly enlarge the boundaries of his hingdom. He dicd in $45^{8}$.

解 Aethilderic ; who the Romans, and extended his conquefts as far as the river Loirc. He is faid to lave taken the city of Paris ifter a fiege of five years, according to fone, and of ten, according to otliers. The Roman power was now totally deflioyed in Italy; and therefore Clacozirus, Clovis, or Louif, for his name is differently uritten, who fucceeded Chilksric, fet himfelf about mahing an entire coupuelt of Gaul. Part of the province was fill retainced by a Roman named Syagrius, who probably had become fovereign of the country on the downfall of the weflem empirc in 476 . He was defeated and taken prifoner by Clovi,, who afteewards caufied him to be belceaded, and foon after totally reduced his 7 dominions.
riencin mo. Thus was the Freich monarchy eftablihied by Clo narchy effe- vis in the year 487 . He now pofieficd all the coundilined by try lying between the Rhine and the Loire; which,
clovis.
though a very extenfive dominion, was yct confiderthough a very extenfive dominion, was yct confider- ably inferior to what it is at prefent.

Clovis lad been educated in the Pagan religion, and continued in that profefion till the 3 oth year of bi: age; notwithttanding which, he allowed his fubjeets fat liberty of conicience. Having married, however, Clotida, daughter of the duke of Burgundy; this princets, who was a zealuns Chitlian, ufed all her infiuence with her huband to perfuade him to embrace her religion. For fome time he continued to waver: but happening to gain a battle, where, being in great danger, he had invohed the grod of Clotilda and the Chrillians, i.e afterwards gave fuch a favourable ear ti) the difcourle of Remigi:a bilhop of Rheims, that lee icon declared himieif a convelt, and was baptized in the year 406. His acknouledgment of the truths of the gofiel was not fillowed by any anendment of liie; on the contraty, he cmployed the remainder of 1i lie in the aggrandizement of himflf and extenfion of his deminions by the moll abominat's treachery, saud, and vielence. In his attack on Armorica he proved unfuccefful. The ithabitants of this country, -hich comprehended the maritime part of ancient Gaul ving betiet the rivers Scinc and loire, had united U- hlis defence; and though abandoned by the Ro-
who alaulted them on all fides. Clovis, finding them tos powerful to be fubdued by force, propoled an univa witi his peoule, which they readily accepted, and this the more eafly on account of his profeting the Chrithan religion. Thus the Chalianity of Clows in teveral intances proved fubferviert to the purpoles of lis ambition, and his power became grdaally very formidable. The Burgundians at this tive pofefled at the country from the forelt of Volses to the fa ut Marfeille, under Gondebaud the thile of Clotilda; who to fecure his oun authoity, had put to death two of his brothers, one of whom was the fither of the French queen. 'The third brother, (iodar, it, whom he had fpared and allowed to poffels the principality oi Geneva, confpired with Clovis to drive him from his dominions. A war having commenced between the French and Burgundian monarchis, the latter was deferted in a battle by Godagefil, and obliged to fy to Avignon, leaving his antagonill mater of the citics of Lyons and Vienne. The vitor next laid fiege to Avignon; but it was defended with fuch vigour, thes Clovis at lan thought proper to accept of a fum of money and an annual tribute from Gondebaud; who was likewile obliged to cede to Godagefil the city of Vienne, and fevral other places taken during the war.

Gondebaud no fooner found himflf at liberty from his enemies, than he afembled a powerful ariny; with which he advanced towards Tienne, where Godagefil limfelf refided at that time. The place was garrioned by 5000 Franks, and might have made confderable reliftance; but Gondebaud being admitted through the fubterraneous paifuge of an aqueduct, mafiacred moft of the Franks, fent the refl priloners to the king of the Vifigoths, and put Godagefil to death. This was quickly followed by the fubmiflion of all the $\boldsymbol{c}$ ther places which had owned the authority of Godagetil : and Gondebaud, now thinking himeelf able to refilt the power of Clovis, fent a meffige to inform him, that he mult mo longer expect the promifed tribute; and though Clovis was very much mortified with this defection, he found himfelf obliged for the prelent to put up with the injury, and accept of the allizace and military fervice of the king of Burgundy.

His next expedition was againht the Viifgoths, who poffefied confiderable territorice on both fides of the Pyrenean mountains. His motives for this undertaking were exprefled in the following freech to his nobility when affembled in the city of Paris, which lie confidered as the capital of his dominions. "It is with concern (faid the religious monarch) that I fuffer the Arians to pofiefs the moll featile part of Gatul: let us, with the aid of God, march againft them ; and having conquered them, ame their kingdom to our dominion.". The nobility approved of the feheme; and Clovis marched againil a prince for whom he had but lately profelied the greatelt regard, vowing to ereet a church in honour of the holy apollice, if he fucceeded in his enterprifc. Alaric the king of the Vifigoths was a young man deflitute of military cxperience, though perfonally brave. He did not therefore hefitate at eugaging his antagonilt; bnt unable to contend with the veteran troops of Clovis, his ammy was uttcrly defeated on the banks of the Clain, 10

France. miles foath of Poiatier, in the year $50 \%$. Alanic, perceiving the ruin of his trons, rufted arsian Cluriv in ferton, by whom he wat l.olld, ast the romatuder of the amp purfued for fone time with great ilnuhter. After this vitory the province of $A_{\text {pataine fut }}$ sitted, and Clovic eftablinhed his winter cuarte:s it Brordean. Thouloule furrendered next fring; an? the roval trealures of the Vitionothe were tramported to Paris. Angouleme was nest reduced, and the city of Artes invelted. But here the victorious career of Clowis was topped by Thealoric king of the Oltrogotic, who hat overturned the dominion of Oloacer in It ily. He hat married A'soliteda the filter of Clow., but lad alfo given his own daughter in marriage to the king of the Viigoths, and had endeavoured, as much as was in his power, to prelerve a good underflanding letween the two fovereigns. Finding this imp, lif he however, and that no bounds could be lict tu the ambition of Clovis, he fint one of his generals with a powerful army againt him; by whom the French monarch was defeated with the lofs of $3 \approx, 000$ men. By this miviotune Clovis was obliged to raife the fiege of Arks with precipitation: however, the Franks flill retained the greateft part of their conquett, and the prosiace of Aquitaine was indifolubly

In 509 , Clowis hat the title of Roma: conful ; by which means the people of Rome were inienibly led to pay a peculiar regard to the French monarchs: and Covis was now fuppoicd to be invelted with a juit title to all his conquelts in whatever mamer they had been acquired. He was folemnly invelted with his new dignity in the cluarch of St Martin in the city of Tours; after which be ontered the cathedral clothed in a purple turic and mantle, the badges of his office.

Clovis nors proceeded to augment his power by the murder of his kinfmen the princes of the Merovingian race. Among thole who perihed on this occation vere Sigebert king of Cologne, with his fon Cloderic ; Cararic, another pince whofe dominions have not bein accurately pointed out by hiforims; Ranacaire, who governed the prefent diovele of Cambray; and Renorier, hing of the territory of Maine. All thefe murciere, however, nere eppiated, according to the viems of the clergy of thole times, by the great zeal he expreticd in the caulc of Chrititiaty, and his liberality to the charch.

Clovis died in the year 511 , after having reformed and publifhed the Salic laws: a few line of which, debarring women foom inheriting any part of the safic land, have been extended fo for as to deprive the females of the rual fanily of France of their right of fucceffen to the throne of that king dom.

Clovis wa, busied in the thurch of St Peter and
 at the mouth of the Aca' ; and their hing Comblin having hoded his forece, bew an to der row the coundy
 Theodohert, who defented the D. ah army :na nat, and lilled thair hing, forcing the teit to ritio wit precipitation.

In iz2, Hermanfoi king of Thainei, haven deftrowd one of his tietimen maned Berloirt, ad teiad on his dominioas, applied to then for atikne againt his cther brother Balderic, whom he intended to treat in the fame maner. In this infamons cuicrprife Thieri embarked, on condition that le thouk hase one hali of B Ilderic's dominions; bet after the unhappy prince wa overcome and killed in battle, Hermantroi feized all his dominions. Theri had no epportmity of revenging himelf till the sear 531 ; when perceiving the power of the Ottrogothe, whom he much dreaded, to be confiderably iffened by the death of ling Theodoric, he engaged his brother Clutaire to allit him: and they accorlingly ontered Thu* ringia with two powerfu! armics. They joined thei forces as toon an they had paind the Rhine, and were cjuicaly atter remorced by a coniderainle body of troops under the command of Theodobent. The aslies attacied the ammy of Hermonfroi, which was advantageoully poted; ind having totally defcated it, he vas orced to tly fiom place to phace in difguile. Soun after this the capital was taken, and Hermantroi himfelt being insited to a conference by Thicri, was treacherouly murdered; after which his extenfive dominions became feudatory to 'Thieri.

In the mean time, Clotilda had excited het childreta to make war on the Burgundians, in order to revenge the death of her father Chilperic, whom Gondebsul king of Burgundy had cauled to be murdered. Gondebaud was now dead, and hat hit his dominions to his fons Sigimund aul Godemar. Sigifmund's foses were quickly defeated; and he himfelf was loon atter delivered up by his osm fubjects to Clodomir, who caufed him to lie thoom into a pit where he peninud miferably. By lis death Godemar became fole matte: of Burgunds. Clotonir marched againt him, and defeated him; but purfaing lis vietory ton cagerly, wan furrounted by hiv enemich atd than. After the redu. tion of Tharingia, however, Childebert and Clut.ise chtered the kingdom of Bursmoly at the head of a powerful army, and in $33+$ compleied the conquelt of it ; in which, according to fome, Cademar was killed: according to others, he retirci into Spain, an! from thence into Africa.

In $; 60$ Clotaire became fole monarch of France. Hectot me be had murdered the fons of Clodomir, who was hithed in enow ite Buggundy as above related. Thieri and his chiddrem were dead, as was afo Childebert ; fo that Chotaire was fole heir to all the dominions of Clowis. He hat sive fons; and the eldet of them, maned Chramme hat isme time before rebelled againt his fither in Autes, As long as Clildebert lived, lac fupported the suas prince; but on his death, Chaman wat doblet t, implure his father's clemens.  father's t:oops, he attempted to refcue them. In this attempt he was taken prifoner, and with his famaly was thrul into a thatched cottage near the field of battle; of which the king was no fooner informed, than he commanded the cottage to be fet on fire, and all that 1: Were in it perithed in the flames.The empite C!otaire did not long furvive this cruel execution argin di- of his fon, but died in 562 ; and after lis death the French empire ras divided among his four remaining fons, Caribett, Gontran, Sigebert, and Chilpcric.The old king made no divition of his dominions before he died, which perhaps caufed the young princes to fall out fooner than they would otherwife have done. After his death, however, they divided the kingdom by lot; when Caribert, the eldelt, had the kingdom of Paris; Gontran, the fecond, had Orleans; Sigebert, had Metz (or the kingdom of Auftralia); and Chilperic had Soifons. Provence and Aquitaine were poffeffed by all of them in common. The peace of the empire was frift difturbed in 563 by an invafion of the Abares; a barbarous nation, laid to be the remains of the Hunns. They entered Thuringia, which belonged to the dominions of Sigebert : but by him they were totally defeated, and obliged to reoafs the Elbe with precipitation. Sigebert purfued them clofe, but readily concluded a peace with them on their firit propofals. To this he was induced, by hearing that his brother Chilperic had invaded his dominions, and taken Rheims and fome other places in the neighbourhood. Againft him, therffore, Sigebert marched with his victorious army, made himfelf matter of Soiffons his capital, and of the perfon of his eldelt fon Theodobert. He then defeated Chilperic in battle; and not only recovered the places which he had feized, but conquered the greater part of his dominions: neverthelefs, on the mediation of the other two brothcrs, Sigebert abandoned all his conquefts, fet Theodobert at liberty, and thus reftored peace to the empire.

Soon after this, Sigebert married Brunehaut daughter to Athanagilde king of the Vifigoths in Spain ; and in a little time after the marriage, died Caribert king of
nions were inmediately invaded by Sigebert and Gon- France. tran, who conquered the greatelt part of them; after which, they fuddenly made peace, Chilperic confenting that B unehaut thould enjoy thofe places which on his marric : he had beftowed upon Galfwintha, viz. Bourdeau:: Limoges, Cahors, Bigorre, and the town of Bearı, tom called Lefcar.

The French princes, however, did not long continue at peace among themfelves. A war quickly enfued, in which Gontran and Chilperic allied themfelves againft Sigebert. The latter prevailed; and having forced Gontran to a feparate peace, feemed determined to make Chilperic pay dear for his repeated perfidy and infamous conduct ; when he was affaffmated by a con- $S$ eseb-it afo trivance of Fredegonde, who thus faved herfelf and faffinated; Chilperic from the moft imminent danger. Immediately on his death, Brunchaut fell into the hands of Chilperic ; but Gondebaud, one of Sigebert's bef gencrals, made his elcape into Auftrafia with Childebert, the only fon of Sigebert, an infant of about five years of age, who was immediately proclaimed king in room of his father. In a fhort time, however, Meroveus, eldeft fon to Chilperic, fell in love with Brunehaut, and married her without acquainting his father. Chilperic, on this news, immediately went to Rouen, where Meroveus and his confort were; and having feized them, fent Brunchaut and her two daughters to Metz, and carried Meroveus to Soiffons. Soon after, one of his generals being defeated by Gontran, who efpoufed Branehaut's caufe, Chilpeiic, in a fit of rage, caufed Meroveus to be fhaved and confined in a monattery, From hence he found means to make his efcape, and with great difficulty arrived in Auftratia, where Brunehaut would glady have protected him; but the jealoufy of the nobles was fo itrong, that he was forced to leave that country; and being betrayed into the hands of his father's forces, was murdered at the inftigation of Fredegonde, as was generally believed.

The French empire was at this time divided between Gontran king of Orleans, called alfo king of Burgundy, Chilperic king of Suiftons, and Childebert king of Autrafia. Chilperic found his affairs in a very difagreeable fituation. In 579 , he had a difpute with Varoc count of Bretagne, who refufed to do him homage. Chilperic difpatched a body of troops againf him; who were defeated, and he was then forced to fubmit to a difhonourable peace. His brother and nephew lived in ftrict union, and had no reaton to be very well pleafed with him. His own fubjects, being oppreffed with heavy tases, were miferably poor and dilcontented. His ion Clovis, by a former queen named Andovera, hated Fredegonde, and made no fecret of his averlion. To add to his embarraffinent, the feafons were for a long time fo unfavourable, that the country was threatened with famine and peftilence at the fame time. The king and queen were both attacked by an epidemic difeafe which then raged. They recovered; but their three fons Clodobert, Samfon, and Dagobert, dicd; after which, the fight of Clovis became to difagrecable to Fredegonde, that the caufed him to be murdered, and likewife his mother Avduvera, left Chilperic's affection for her hould return after the tragicai death of her fon.
ln 583 Chilperic himfelf was murdered by fome un-and likeknown affaflins, when his dommions ware on the paint wife that-

Framee of being conquered by Gomtran and Childeaset, who had entered into a league for that purpofe. After his death Fredegonde implored the protection of $G$ ontran for herelf and her infant fon Clotaire; which he very readily grantet, and obiiged Childebert to put an end to the war. He found himfelf, bowever, geeatly difficulted to leep Fredegonde and Brunchaut in awe; for thefe two princeffes having been long rivals and im. placable enemies, wete continually plotting the defiruation of each ether. This, however, he accomplished, by favouring formetimes Brunchaut and fometimes Fredegonde; fo that, during his lite, neither of them durt urdertake any thing againt the other.

On the 28th of March 593, died Gontran, hering lived uprards of 60 , and reigned 32 years. Childebert fiuccecded to the kinglom without oppoltion, but did not long enjoy it ; he himfelf dying in the year so6, and bis queen hortly after. His dominions, were divided between his two fons Theodobert and Thierri; the firlt of whom was declared king of Aultralia, and the latter king of Burgundy. As Theodobert was only in the tith year of his age, and Thierri in his reth, Brunehaut governed both kingdom, with an abfolute fway. Fredegonde, however, tonk care not to let ilip fueh a favourable opportunity as was offered her by the death of Childehert, and therefore made herfelf miftrefs of Paris and fome other places on the Seine. Upon this Brunchaut fent againit her the beit part of the forces in Auilrafia, who were totally defeated; but Fredegonde died before the bad time to improve her victory, leaving her fon Clotaire heir to all her dominions.

For fome time Brunchaut preferved her kingdom in peace; but in the end her own ambition proved her ruin. Intead of intructing Theodobert in what was neceffary for a prince to know, the took care rather to keep him in ignorance, and even fuffered him to marry a young and handfome llave of his father's. The new queen was poffeffed of a great deal of aflability and good nature; by which means the in a thort time gained the affiection of her hufband fo much, that be readily confented to the banifment of Brunehaut. Upon this difgrace the fled to Thierri king of Burgundy, in the year 599. By him the was very hindly received; and inftead of exciting jealouties or mifunderitandings between the two brothers, the engaged Thierri to attempt the recovery of Pavis and the other places which had been wrefted from their family by Fredegonde, procuring at the fame time a confiderable body of auxiHiaries fom the Viligoth. This meafure was fo acseptable to Theodobert, that he likewile raifed a mumerous army, ard invaded Clotaire's domivions in confunction with his brother. A battle culucd, in which the forces of Clotaire were totally defeated, and himfelf obliged foon after to tue for jeace: which was not granted, but on condition of his yielding up the bett part of his dominions.

This treaty was conchuded in the year 6,00 ; but three years afterward, it was broken by Clotaire. He was again attacked by the two brothers, and the war carried on with great vigour till the next fpring. At this time Thierri baving forced Landri, Chotaire's ge. neral, to a battle, gave him a total overthrow, in which the king's infunt fon Merovens, whom he lad fout :n Whg wih I Landri, was mallaced; to gratity, it Co.

 brother: and his reforment was hirhily ind ame ib Brunchaut, who newer forget bee diggrace in beisu- b nilked from his court. A war wos theretore comene ced between the two brothers in $65 ;$; bat is wis in, highly difapproved of by the nolulity, that Thimeri tound himfelf obliged to put an end to it. The tra: quillity which now tork place w-s angin diturbed in 607 , by Theodobert's fending an embally to demant tome part of Clildebert's dowinions, whith had hew added, by the will of that monarch, to thole of Burgundy. The nobility of both kinedome were fo muci. averie to war, that they conftrained their king, to con:lent to a conference, attended by an equal number of troops; but Theodobert, by a fandalnu: breach of his faith, brought double the number, a:d compelled his brother to fubmit to what terms be pleafed. 'I his pie:of treachery initantly brought on a war ; for Thicri was bent on revenge, and his nobility no longer opmor fed him. It was neceffary, hovever, to fecure (l]et tie by a negotiation; and accordingly a promile was m ule of rettoring thole parts of his dominens which lad formerly been taken from bin, prowided he weu! 1 remain quiet. This theaty being finibed, Thierri entered Theodubert's dominion, defeated lim in two battles, took lim prifoner, ufed him with the utmont indignity ; and having cauted an infunt ton of his to be put to death, fent him to his grandmother Brune. haut. By ber oiders he was firit fhaved and confinel in a monattery; but afterwands, fearing left he thrould make his efcape, the caufed him to he put to desth.Clotaire, in the mean time, thought that the bett method of making Tbierri keep his word was to live on thofe places which he had promiled to reltore to him, before his return from the war "ith Theodobert. 'This he accordingly did; and Thierri no fooner heard of his having done fo, than he lent him a mallage reguitins him to withdraw his forces, and, in eafe of his refufal, declared war. Clotaire was prepared for this; and accordingly affembled all the forces in his dominions, in order to give him a proper reception. Put before Thierri could reach hi, enemies, be was feized with a Dosth dyfentery ; of which he died in the year 612, having thecra. lived 26 yeara, and reigned 17 .

On the death of 'Thierri, Brunehant immedintely citufed liv eldelt fon, named Sigibert, then in the roth sear of hivage, to be proclamed king. It is prolable that the intended to have qoverned in his name with an abfolute livay ; but Clotaire did not give her time to difcover her intention. Hasing great intelligence in Autratia and Burgundy, and knowing that the nobility in both kingdoms were difaffected to Brushaur, he declared war againt her; and the being hetrayed t.: her ecnemal, fall int., the bond, of her enemic: Clutaire gave her up to the nobles; who generally 11 トッ d

France. hated ber, and who ufed her in the moft cruel mamer. After having led her about the camp, expofed to the infults of all who had the meannefs to infult her, the was tied by the leg and arm to the tail of an untamed horfe, which, fetting off at full fpeed, quickly dafhed out her brains. After this her mangled body was raduced to alhes, which were afterwards interred in the abbey of St Martin at Autun.

Thus in the year 613 , Clotaire became fole monarch of France; and quietly enjoyed his kingdom till his death, which happened in 62 8 . He was fucceeded by Dagobert; who proved a great and powertul prince, and raied the kingdom of France to a high degree of fplendour. Dagobert was fucceeded by his fons Sigebert and Clovis; the former of whom had the kingdom of Auftralia, and the latter that of Burgundy. Both the kings were minors at the time of their acceffion to the throne, which gave an opportunity to the maycrs of the palace (the higheft officers under the crown) to ufurp the whole authority. Sigebert died in $6 \not+0$, after a thort reign of one year; leaving behind hime an infant fon named Dafobert, whon he itrongly recommended to the care of Grimoalde his mayor of the palace. The minitter caufed Dagobert to be immediately proclaimed king, but did not long furfer him to e:rioy that honour. He had not the cruelty, however, to put him to death; but fent him to a monatery in one of the Wellern iflands of Scotland; and then, giving out that he was dead, advanced his own fon Childebert to the throne. Childebert was expelled by Clovis king of Burgundy; who placed on the throne Childeric, the fecond fon of Sigebert. Clovis died foon after the revolution, and was fucceeded in his dominions by his fon Clotaire; who died in a fhort time, without iffue. He was fucceeded by his brother Childeric ; who, after a thort reign, was murdered with his queen, at that time big with child, and an infant fon named Dasobert; though another, named Daniel, bad the good luck to efcape.
M.ferable France.

Miferable The affairs of the French were now in the moft deplorable fituation. The princes of the Merovingian race had been for fome time entirely deprived of their power by their officers called mayors of the palace. In Auftrafia the adminiftration had been totally engrofied by Pepin and his fon Grimaulde; while Archambaud and Ebroin did the lame in Neultria and Burgundy. On the reunion of Neultia and Burgundy to the reit of the French dominions, this minifter ruled with fuch 2 defpotic fway, that the nobility of Aultrafia were provoked to a revolt ; electing for their dukes two chiefs named Martin and Pepin. The forces of the confederates, however, were defeated by Ebroin; and Martin having furrendered on a pronife of fafety, was treacheroully put to death. Pepin loft no time in reryuiting his thattered forces; but before he had any occafion to try his fortune a fecond time in the field of vattle, the alfarfination of Ebroin delivered him from all apprehenfions from that quarter. After his death, Pe$f_{\text {in }}$ carried every thing before him, overthrew the royal army under the command of the new ninifter Bertaire; and, having got polfellion of the capital, caufed himfelf to be declared mayor of the palace; in which ftation be cuntinued to govern with an abfulute fway during the remainder of his life.

Pepin (who had got the furname of Herifal from
his palace on the Meufe) died in the ycar 714 , having enjoyed unlimited power for 26 years. He appointed his grandfon Theudobalde, then only fix years of age, to fucceed him in his polt of mayor of the palace. This happened during the reign of Dagobert already mentioned; but this prince had too much firit to fuffer himfelf to be deprived of his authority by an infant. The adherents of the young mayor were defeated in battle, and this defeat was foon followed by his death. Charles, however, the illegitimate fon of Pepin, was Exploits of now railed to the dignity of duke by the Auftrafians, exparles and by his great qualities feemed every way worthy of Martel. that honour. The murder of Dagobert freed him from a powerful opponent; and the young king Chilperic, who after Dagobert's death was brought from a cloifter to the throne, could by no means cope with fuch an experienced antagonitt. On the 19 th of March 717, Charles had the good fortune to furprife the royal camp as he paffed through the foreft of Arden; and foon after a battle enfued, in which the king's forces were entirely defeated. On this Chilperic entered into an alliance with Eudes duke of Aquitain, whofe friendilip he purchafed by the final celfion of all the country which Eudes had feized for himfelf. Charles, however, baving placed on the throne another of the royal family named Clotaire, advanced againf Chilperic and his afiociate, whom he entirely defeated near Suiffons. After this difafter, Eudes, defpairing of fuccefs, delivered up Chilperic into the hands of his antagonift: after having ftipulated for himfelf the fame terms which had been formerly granted him by the captive monarch.

Charles now advanced to the fummit of power, treated Chilperic with great refpect; and, on the death of Clotaire, caufed him to be proclaimed king of Auftrafia; by which, however, his own power was not in the leat diminiihed; and from this time the authority of the kings of France became merely nominal ; and fo inactive and indolent were they accounted, that hiftorians have bellowed upon them the epithet of faineans, i. e. "lazy or idle." Charles, however, had ftill one competitor to contend with. This was Rainfroy, who had been appointed mayor of the palace; and who made fuch a vigorous refiltance, that Charles was obliged to allow him the peaceable poffefion of the country of Anjou. No fooner, however, had Charles thus fet himfelf at liberty from domeftic enemies, than he was threatened with deftruction from foreign nations. The Suevians, Frifons, and Alemanni, were fucceffively encountered and defeated. Eudes alfo, who had perfidioufly broken the treaties to which he had bound himfelf, was twice repulfed; after which Charles invaded Aquitain, and obliged the treacherous duke to hearken to reafon. This was fcarce accomplinhed, when he found himfelf engaged with a more formidable enemy than any he had yet encountered. The Saracens having overrun great part of Afia, now turned their victorious arms weitward, and threatened Europe with total fubjection. Spain had already received the yoke ; and having paffed the Pyrences, they next invaded France, appearing in valt numbers under the walls of Thouloufe. Here they were encountered and defeated by Eudes; but this proved only a partial chack. The barbarians once more paling the Pyrenees, entered France with fuch a powerful army, that Eudes was no longer able

## F R A

France. to refit. Fic encountered them indeai with his acent tomed valour; bit being forced to yield to fuperior power, he folicited the protection and allilance of Charles. Oa this occation the latter, on account of his valour and perfonal tlrength, acquired the nane of . Mar$t \mathrm{c}$, i. e. "the hammer," alluding to the violence of the drokes he butowed on his enemies + . Three hundred and feventy-five thoufand of the Infidels, among whom was the commander Abdelrahman himfelf, are fiid to have peribed in the battle; notwithifanding which they form made another irruption: but in this they were attended with no better fuccefs, being again defeated by Charles; who by fo many victories effablibed his power on the molt folid foundation. Having again defeated the Frifons, and witi his own hand killed their duke, he affumed the forereignty of the dominions of Eudes after his deceate, referving to himfelf the claim of homage, which he ought to have yielded to Thicrri his lawful fovereign. At lat his fame grew fo great, that he was chofen by Pope Gregory III. for his protcetor. He offered to fliake off the yohe of the Greek emperor, and to invelt Charles with the dignity of Roman conful ; fending him at the fame time the keys of the tomb of St Peter; but while this negotiation was going on fucceffully, the pope, the emperor, and Charles France di. Martel himfelf, died. After his death, which happened in the year 741 , his dominions were divided among his three fons, Carloman, Pepin, and Grippon, according to the difpolitions he had made in his lifetime. By this Carloman, the elleft, had Auftrafia; Pepin, the fe-
cond, Neuftria and Burgundy; while Grippon, the third, had only fome lands affigned him in France; by which he was fo much difpleafed, that the tranquillity of the empire was foon dilturbed. With the affiliance of his mother Sonnechilde he fcized on the city of Lahon, where he endured a violent fiege. In the end, however, he was obliged to fubmit ; Sonnechilde was put into a monaters, and Grippon imprifoned in a cafte at Arden. The two brothers, having thas freed themiclves from their domeltic enemy, continued to govern the empire with uninterrupted harmony; but Nheir tranquillity was foon difurbed by the intrigues of Somechilde. That enterprining and ambitions woman had negotiated a marriage between Olilon duke of Pavaria and Hiltrute the filler of the two pinares. This was no fooner accomplified than Othlon, imingated by Sonnechilde, and alarmed at the growing pown of the two princer, entered into an alliance with Theodobald duke of the Alemami and Theodoric wake of the Saxons; who hav ing affembled a formidable arruy, advanced directly againtt the princes. They posted themfelves in an adsantageous manner, with the river Lech in their front ; but Carloman and Pepin, jallity H.e river at different fords in the night time, attacked the camp of the allies with great vigour. The engagement continued doubtful for five hours; but at latt the inatenchanents were forced on all fides, the Bavarians and Saxons entirely routed, and the vanquilhed duhes ohliged to fubmit to the clemency of the victors. During their abicnee on this expedition, Hunalde, whom Charles Martel had appointed duke of Aquitain, havinc likewife entered into a confederacy with Odilon, paffed the Loire, ravaged the open conintry, and burnt the magnificent eathedral of the city of Chartres. The two priace, however, having roturned with their vic-
torious arme, Ilmalde foun! himicli oblined to re- Frace treat : and cren this avalid him hut little: for the Franks entering the dachy of Apuitain, commited tuch devallations, hat humate in defyair religneal his duminions to hir ion, and retired into a conesnt. This eveat was foon followed hy a dinilar reti $\quad$, loman, notwithlanding the unintertupted fucect h had met witi. He fudlenly took the re lurion of retining into a covent, and perfited in his defign notuithon!ing the eatreaties of Pepin, who, to appeatance at :cant, did all he coshd to dirluade him.

By the refigeation of Carloman, which happoned in p p the year $i \neq 6$, Pepin was left fule mather of France. . . . and in this exalted ftation he acquitted himftit in for ha a manmer as has juifly rendered his name famous to po ther Iterity. One of the forlt acts of his new adnumitration was to releate his brother G:ippon from prifon: but that treacherous prince had no foner regsained his liberty, than he again excited the Saxons to take up anne. His enterprile, however, proved unfuceeftul: the Sasons were defeated, thuir duke Theodoric taken, and his fubjects obtiged to fubmit to the will of the conqueror ; who upon this occafion cauled them make a proteftion of the Chriftian religion. Grippon thet Hed to Hiltrude, his half filler, whole huband Odilo was now dead, and had left an infant fon named To. $/ \mathrm{b}$ lon. He net with a favourable reception from lier, but, with his ulual treachery, feized both her and hor fon by the affitance of an army of malecontent Franks, whom he had perfuaded to join him. His next itep, was to affume the fovereignty and title of duke of Bavaria; but being driven from the throne by Pe in, he was obliged to implore his clemency, which was onec more granted. All thefe misfortunes, however, were not yet fufficient to cure Grippon of his turbulence and ambition: He once more endeavoured to excite difturbances in the court of Pepin; but being finally detected and baffled, he was obliged to take refuge in Aquitain.

Pepin having now fubdued all his foes both fureign A Tuines and domeftic, becan the think of the tutle e: and domettic, began to think of aftuming the title of $k$.nz.
king, after having fo long enjoyed the regal power. H:s wibes in this refpect were quite agreeable to thore of the ration in general. The nobility, huwever, wer bound by an oath of allegiance to Childeric the nominal monarch at that time : and this oath could not be difpenfed with but by the authority of the pape. Amballadors for this purpote were therefore defpatched both from Pepin and the nobility to Pope Zachary, the reiguing pontif. 1ti, holinefs replied, that it was lawful to thatsfer the regal dignity from hand, incopabic of mantaining it to thole who had fo ferceffully preferved it ; and that the nation might unite in the lame perfon the authority and title of $k=n /$. Oa this the unfurtanate Childeric was degraded from his dignity, fhaved, and contited in a monatery fir life; P'epin affumed the title of han of France, and the line of Clovis was finally fet alide.

This revolution took place in the year 751. The attention of the new monarch was firil claimed by a resolt of the Sanons; but they were foon reduced $t$, fubjection, and obliged to pay an additional tribute: and durin: his eveedition aganat them, the king bad the incisfaction of getting rid of his reitlef and trearheres, compecitor Grippon. This turbulent prince, ...ving foon .iscome weary of refiding at the court of Aquitai:, deermined to efcape form thence, and put hmielt uader the protection of Aftolphus king of the Lomba's, but he was killed in atempting to fire: a pafs on the confines of Ita'y. Pepin in the mean time cortirved to pulh his good fortume. The fubmifion If the S. xons was foon followed by the redudion of Britomy ; and that by the recorcry of Narbone from he Infide.s. Hi, zext exploit was the protection of Pope Stephen III. acainh Adopphas the hity of the Lumbuds, who lad feized on the corchate of Raware, and infited on being achnotledged hing of Rom:- The pope unatle to contend with fuch a powerful rival, hafted to cruls the Alps and implore Te puraction of P (ain, whor received him with ell :H rifed due to his character. He was lodged in the anitey of St Dennis, and attonded tho the king in perCon duing a dangerous ticknef, with which he was teized. On his recurery, Sitphen folemnly placed the dinarm on the head of his benctactor, belowed the resel anction on lis fons Clarles and Carloman, and (1).men on the three princes the title of pawicion of $R$ ag. In seturn for thefe honour, Peyin accompawad the poriff into Italy at the hend of a powerful arms. Altophos, unalle to whitand fuch a poverful antagonit, thut himfelf up in Pavia, where he was clofely beficged by the Franks, and oblised to renounce ail pretenims to the fovereignty of Rome, as well as to) riflore the city and exarchate of Ravenn, and twear to the obfervance of the treaty. No fooner was U'ain gone, howerer, than Aftolphis broke the trea:y he had juft tatified with fuch folemnity. The pope was aguin reduced to diftres, and again applicd to Pc. ain. He now fent him a pompous epiflle in the layle and character of St Peter bimelf; which fo much inthamed the zeal of Pepin, that he intantly fet out for faly and compelled Aftolphus a fecond time to fubmit to his terms, which were now rendered more fevere ty the inapulition of an annual tribute. Pepin next made a tour to Rome; but finding that his prefence there gave great uneafinefs both to the Grcehs and to the paye himelf, he thougit proper to finith his vift is a thurt time. Soon after his return Attolphus died, and his dominions were ufurped by his general Dilier ; who, however, obtained the papal lanction for what he had done, and was recognized as lawful fovereign of the Lombards in the year 756 .

Pepin returned to France in triumph; but the leace of his dominions was foom dillurbed by the revolt of the S.axons, who aluays bore the French yoke with tic umof inspatience. Their prefont atienipts, howwer, froved efgally unfuccetsfil with thole they had tormerly made ; being oblined to fabmit and purchaie their pardon not only by a renewal of their tribute, but by an additional fupply of $3: 0$ horfe. But while the ning was abfent on this cypedition, Vaifar duke of Aquitain took the opportunity of ravaging Burgundy, where he carried his devaltations as far as Chalon. $P_{\text {epin }}$ foon returned, and enteting the dominions of Vaiar, comr:itied fimilar devaltations, and would probably have reduced the whole territory of A puitain, had he not been interrupted by the hottile preparations of his nephew Talilon the duke of Bavaria. The king, however, contented himflf at prefent with fecuring his fromicrs by a chain of fofts, againt any
invaion; after which he retemed his enterprife on the France. Cominione of Vorror. The latter at firk attempted to impede tive prosef of his antagonif by burning and loying wat e the comtry: but fading this to no purpule, he deternined to $\operatorname{try}$ his fortune in an engagement. Victory declared in fivour of Pepin; but he refuled to grant a peace upon any terms. The French monarch advanced to the banks of the Garone ; while Vaidar was abandoned by his ally the duke of Bavari?, and even by his own lubjects. In this difrefs he retired with a band of faithful followers into the country of saintonge, where he defended himfelf as long as polifble, but was at lat deprived both of his crown and life by the victor.

Thas the ducly of Aquitain was once more annexed :o the crovn of France; but Pepin had farce time to indulge himble with a vien of his new conqueit when be wav icized with a flow fever, which put an and to his lite in the vear -68 , the 5 th of his are, $D$ ot and $17^{\text {th }}$ of his reign. He was of a thort dature, Pepre whence he had the jumame of Le Bref, or the Shert; but his great actions jutly entitled him to the character of a hero; though under the fucceeding reign his own fame letmed to have been entirely forgot, and on his tomb wav only infribed, " Here lies the father of Charlemagne."

Pepin was fucceeded in bis authority by his two succeeded fons Charles and Carloman; to whom with his dying by his two breath he bequeathed his dominions. They continued io... to reign jointly for fome time; but the active and enterpriting pinit of Charles gave fuch umbraze to the weak and jealous Carloman, that he regarded him with envy, and was on the point of coming to an open rupture with him, when he himielf was taken off by de:th, and thus the tranquillity of the empire wis preferved.

The firit military enterprife of Charles was ageinit Humalde, the old duke of Aquitain; who leaving the monaftery where he had refided upwards of 22 years, aflumed the roval title, and was joyfully received by his fubiecls, alseady weary of the French voke.Charles took the field with the utmott expedition, and with dificulty prevaled upon his brother Carloman, who was then alive, to join him with his forces. But the junction was fiarce effected, when Carloman withdrew his forces again, and left his brother to carry on the war in the beit manver he could. Charles, though thus deferted, did not heritate at engaging the enems; and having overthrown them in a gicat battle, Huvalde was obliged to fly to the territories of Lupus duke of Gatcony. Charle quickly fent an embaliy demanding the fogizive prince; and Lunus, not daring to dibobey the orders of fuch a posertul monarch, yielded up the udfortumate Hunalde, who was intantly caut into piifon, from which, however, he afterwards made his efcape.

27
The death of Carloman, which happened in the year R eign of 771 , left Charles fole matter of France, but the rcvolt Charles the of the Saxons involved him in a feries of wars from Great. which he did not extricate himelf for 33 vears. The e had long been tributaries to the French, but frequently revolted; and now, when freed from the terror of Pe fin's ams, thou lit they had a sight to thane of the yohe altogether. Charles entered their country with a powerful army ; and havino defeated them in a num

fpirit of the prople. At laf therefore he was obliged to have recourfe to negotiation. Witikind and feveral other chiefs were invited to an interview; where Charies reprelented to them in fuch ilrong colours the min which muft neceflarily enfue to their country by prerlifing obftinately in oppofition to him, that they were induced not only to perfuade their countrimen finally to fubmit, but to embrace the Chritlian religion.

Charles having thus brought his affairs in Saxony to a happy conclufion, turned his arms againft 'Yafilon duke of Bavaria, who had underhand lupported the Saxons in their revolt. Having entered his country with a powerful army in the year 1787 , he made fuch rapid advances, that the total deftruction of Taffilon feemed inevitable. Charles had advanced as far as the river Lech, when Taflilon privately entered his camp, and threw himfelf at his feet. The king had compaffion on his faithlefs kinfinan on feeing him in this abject poffure ; but no fooner did the traitor find himfeli at liberty, than he ftirred up the Hunns, the Greek emperor, and the fugitive Adalgife, againtt the king. He fomented alfo the difcontents of the factious nobles of Aquitain and Lombardy ; but his fubjects, fearing left thefe intrigues fhould involve them in deftruction, made a difcovery of the whole to Charles. Tafilon, ignorant of this, entered the diet at Ingetheim, not fulpecting any danger, but was initantly arrefled by order of the French monarch. Being brought to a tridl, the proofs of his guilt were fo apparent, that he was condemned to lofe his head: the punihment, however, was afterwards mitigated to perpetual confinement in a monaftery, and the duchy of Bavaria was annexed to the dominions of Charles.

The Hunns and other enemies of the French mowarch continued to prolecute their enterprifes without regarding the fate of their affociate Taffilon. Their attempts, however, only ferved to enhance the fame of Charles. He defeated the Hunns in Bavaria, and the Greek emperor in Italy; obliging the latter to renounce for ever the fortune of Adalgife. The Hunns, not difheartened by their defeat, continuing to infeft the French dominions, Charles entered their country it the head of a formidable army ; and having furced their intrenchments, penctrated as far as Kabb on the Danube, Eut was compelled by an epidemic diflemper to retire before he had finiflhed his conqueft. He was no fooner returned to his own dominions, than he had the mortification to be informed, that his eldeft fon Pepin had confired againl his fovercignty and lite. The plot was difcovered by a prieft who had accidentally fatlen afleep in a church where the confirators were affembled. Being awskened by their vices, he overheard them confulting on the proper mealures for completing their purpofe; on which he mitiantly fet out for the palace, and fummoned the mowreh from his bed to inform him of the guilt of his th. Perin was feized, but had his life fpared, though condemned to expiate his ofiences by fpending the renainder of his days in a monatery.

Charles was no fooner freed from this danger than he was again called to arms by a revolt of the Saxons on the oie hand, while a formidable invafion of the Noors dintrefied him on the other ; the Hunns at the tame time reneving their depredations on his domi-
nions. The king did not at prefent make war againft the Moors; probably forefeeing that they would be called off by their Chritian enemies in Spain. This accordingly happened; the victories of Alonfo the Chate obliged them to leave France ; atter which Charles marched in perfon to attack the Savons and Hunns. The former confented again to receive the Chritian religion, Lut were likewile obliged to deliver up a third part of their army to be difpoled of at the king's pleafure ; but the Hunns defended themfelves with incredible vigour. 'I hough often deicated, their love of liberty was altogether invincible; fo that the war was not terminated but by the death of the king, and an almoft total deftruction of the people: only one tribe could be induced to acknowledge the authority of the French monarch.

Thefe exploits were fimihed betwixt the years 793 and 798 : after which Charles invaded and fubdued the illand of Majorea and Minorca; which the diffenfons of the Moorilh chiefs gave him an opportunity of duing. The fatisfaction he felt from this new conqueft, however, was foon damped by the troubles which broke out in Italy. After the death of Pope Adrian, his nephew afpired to the papal dignity ; but a priett named Leo being preferred, the difappointed candidate determined on revenge. He managed matters fo well, that his defigns were concealed for four years. At laft, on the day of a proceffion, a furious affault was made on the perfon of Leo. The unfortunate pontiff was left for dead on the ground; but having with difficulty recovered, and made his efcape to the Vatican, he was protected by the duke of Spoleto, at that time general of the French forces. His caufe was warmly efpoufed by Charles, who invited him to his camp at Paderborn in Wtitphalia; whence he difpatched him with a numerous guard to Rome, promifing foon after to vifit that metropolis, and redrels all grievances. His attention for the prefent, however, was called by the defents of the Normans on the maritime provinces of his dominions; fo that he was obliged to defer the promifed affiflance for fome time longer. Having conilructed forts at the mouths of moft of the navigable rivers, and further provided for the defence of his territories, by inttituting a regular mulitia, and appointing proper fquadrons to cruife againt the invaders, he fet out for the fourth and laft time on a journey to Rome. Here he was received with the highert polfible honours. Leo was allowed to clear himfelf by oath of the crimes laid to his charge by his enemies, while his accufers were fent into exile. On the feftival of Cluriftmas, in the year 800, after Charles had made his appearance in the cathedral of St Peter, and affitted devoutly at mafs, the pope fuddenly put a crown on his head; and the place indintly refounded ne is with acclamations of " Long life to Clarles the Au-crowned guft, crowned by the hand of God! Long life and emperor of victory to the great and pacific enperor of the Ro- the weft.
 with roval unction; and after being concurted to throne, he was treated with all the refpect ufually paid to the ancient Cielars; from this time alto being honoured with the title of Charlomegne, or Charits the Grat. In private converfation, however, he ufually protelted, that he was ignorant of the pope's intention at this time; and that, had he known it, he would have

## $\mathrm{F} R$ A $[6 \hat{j}] \quad \mathrm{F}$ R A

rrance. difappointed him by his abence: but the le prote.tat tions were not generaliy believed; and the care: F.e took to have his new title acknomledged by the eation emperors, cevidently thowed hov for.d he was of it.

Charles, now raifed to the fupreme degnity in the welt, propofed to unite in himfelf the whole powtr of the fint Roman emperors, by marrying Irene the emprefs of the eatt. But in this he was difappointed by the marriage of that princel's by Nicephorus; however, the latter acknowledged his new dignity of Auguftus, aud the boundarics of the two empires were anicably fettled. Charles was further gratiried by the refpect paid hins by the great $\mathrm{H}_{\text {aroun }}$ Al-Ralhid, caliph of the Saracens, who yielded to him the facred city of Jerufalem, and holy fepulchre there. But in the mean time his empire was threatened with the invation of a very formidable enemy, whom even the power of Charies would have found it hard to refilt. Thefe were the Nurmans, at this time under the government of Godfrey a celebrated warrior, and who by their adventuruus fpirit, and dikil in maritime affairs, threatened all the wettern coalts of Europe with defolation. From motives of mutual convenience a tranditory peace was ettabliihed, and Charles made ufe of this interval to fettle the final diftribution of his dominions. Aquitain and Gafcony, with the Spanill Marche, were afiligned to his fon Louis; Pepin had Italy confirmed to him; and to this was added the greatelt part of Bavaria, with the country now poffiefied by the Grifons. Charles the eldelt had Neultria, Auttrafia, and Thuringia. The donation was fuppoied to be rendered more authentic by the fanction of the pope. This diviinon, however, had fcarce taken place, when the princes were all obliged to defend their domitrions by force of arms. Louis and Pepin were a:tacked by the Saracens, and Charles by the Sclavonians. All thefe enemies were defeated; but while Charles hoped to fpend the fhort remainder of his life in tranquility, he was once more calied forth to martial exertions by the hoitile behaviour of Godfrey the Norman leader. Charles fent him a mefliage of defiance, which was returned in the fame ftyle by Godfrey: but the former, by artfully fomenting divifions among the northern powers, prevented for a while the threatened danger; but, thefe difurbances being quelled, the Normans renewed their depredations, and Charles was obliged to face them in the feld. An engagemen however, was prevented by the death of Godirey, who was affifininated ly a private foldier; on which the Norman army retreated, and the domirions of the empire till remained free from thefe invaders. Still the latter days of Charles were embittered by donettic misfortunes. His favourite daughter Rotrude died, as did alfo Pepin king of Italy; and thefe misfortunes were foon followed liy the death of his eldelt fon Charles. The emperer thien thought proper to affociate his only furviving fon Jone at Aix-la Chapelle. Charles himfelffusived this tranfaction only a few months: his death happened on the $2-$ th of January 814 , in the 7 11t year of his age, and 47 th of his reign.

By the martial achievements of this hern, the French monarchy was raifed to its utmon pitch of fiplendour. He had added the province of Aquitain to the territurics of his anceltors; he had confined the inha-
bitanto of Brittany to the Mores of thas oces, and cio france. liged then to fubmit to a difincetm tribute. He had redue ander his d minion all that part of Syain which extends from the Pyrelken to the river Ebro, and includes the kingdom of Knullillon, Nevarre, Arragon, and Catalonia. He polefied Ltaly from the Alps to the borders of Calabria; Lut tie duehy of Beneventuin, including moft of the preient kingidom of Naples, efcaped the yoke after a tranfitory fubmition. Befides thefe extenive countries, Cliarles addel to his territories the whole of Germany and Panoonia; in that the Fench now had the jurititition of all th. country from ealt to welt, from the Ebro isi Spais. to the Vitulala; and from north to fouth, from the duchy of Beneventum to the river Eyder, the ham. dary between Germany and the dominions of Denmark. In acquiring thefe extenfive dominions Charle, had been guilty of horrid and repeated mallacres, for which. however, he had been in fome meafure excufable by tibarbarity and rebellious difioftion of the people wit? whom he had to deal, upon whom no mild meafure would probably have had any eftect. His eftablithing of fchools throughout the coniquered provinces, thowe! alfo his inclination to govern his fubjects in peace. and to take proper fteps for the:r civilization; though indeed many parts of his private conduct thowed no finall inclination to cruclty; particularly the fate of the fons of Carloman, of whom no account could eve: be obtained. His advice to his fon Louis indeed was excellent ; exhorting him to confider his people as his children; to be very mild and gentle in his adminiflration, but firm in the execution of juttice; to reward merit ; promote his nobles gradually ; choole minifters deliberately, but not remove them capricioully or without fufficient reafon. All thefe prudent maxims, however, were not futticient to enable Louis to govern dominions fo extenfive, and people to turbulent as he had to deal with. At the time of the deceafe of his father this prince $w$ as about 35 years of age, and had married Ermengrde, daughter of the count of Hefbai of the dioceie of Liege, by whom he had three fons, Lothaire, Pepin, and Louis. Lothaire, the eldett, was aflociated with himielf in the empire, and the two youngeft were intrutted with the goveruments of 1 quitain and Bavaria. Every one of the princes proved unfaithful to their father, as well as enemies to one anuther. The death of Ermengarde, and the marriage of the emperor with Judith a princefs of Bavaria, anful but accomplinet, proved the firf fource of calamity to the empire. In the year $\delta_{23}$, Charles, the emperis's youngeff fon, was born; and his pretemfions becme in time more fatal to the public tranquillity than the ambition and difobedience of all the rett. Various path of the Imperial domimions were likewife affuted by foreign enemies. The inhabitants of Brittany and Navarre revolted; the Moors invaded C.italonia; while the ambition of Judith proluced a war amonglt the brothars themlelv:

Chorles at firt had been appuinted fovereign of that amers the p.rt of Germany bounded y ihe rivers Danube, the no of Aline, the Nechar, and the Rline; the comery of Lous the the Grions and kargundy, comprehonding Geieva Geat : and the Swiss cantons; brit thii was oppoled the the threc elder fons. Pepin and Louis advancel with the

## i R A $\quad\left[\begin{array}{l}G \\ G\end{array}\right.$

paini formo deferted their ftandard and fuined the makontents. The emperor was tiken prifner, and the emprel's retired to a monaftery. Lothaits, the eldet of the young princes, to whom the reli found themfelves obliged to fubnit, was the perion who retained the emperor in his pofteflion; but, notwithending his breach of duty, his heret was tonched with remorle on accomt of the crimes he 1 nd committed. Dreading the reproach of the world at large, and being threatesed with the cenfures of the cherch, he theew himielf at his father"s feet, and hegged pardou for his guilt, confenting to relinguih the authority he had uniully ufurped. 1t. Louis was reeitablithed in his authority by the diet of the empire which had met to depofe him. His firt itep was to recal his emprefs from the monatitery to which the had retired; but this princels, implacable in her refentment, now perfiecuted lothaire to fich a degree, that he was obliyed to join his two brothers Pepin and Louis in a confederacy againी their father. The old tmperor thought to check this rebellious difipofition Ey revoking his grant of Aquitain to Pepin, and conferring it on his younget fon Charles, then only nine years of age; but Pope Gregory IV゙. conferred the Imperial dignity itielf on Lothaire, depoling the unhappy monarch, and again fending the emprefs to a nunnery in the foreft of Arden. The unnatural behaviour of his fon, however, once more excited the compation of his fubjects. Dreux, the bilhop of Mentz, ufed his intereit with Louis king of Bavaria to arm his fubjects in defence of his father and fovereign. In this enterprife the Bavarian monarch was joincd by the French and Saxons; fo that the aged emperor was once more reftored, the emprefs releated from her numnery, and Charles from his prifon, in the vear $\varepsilon_{33}$.

The ambition of Judith now fet matters once more in a flame. Taking advantage of the affection her hulband bore her, the perfuaded him to inveft her fon Charles with the fovereignty of Neufria as well as the dominions formerly affigned him. This was productive of great difcontent on the part of Lothaire and Pepin ; but their power was now too much brokea to be able to accomplith any thing by force of arms. The death of Pepin, which happened foon after, produced a new divifion of the empire. The claims of young Pepin and Charles, fons of the deceafed prince, were entirely difregarded, and his French dominions divided between the two brothers Charles and Lothaire, the latter being named guardian to his infant nephew. This enraged Louis of Bavaria, whofe interelt was entirely neglected in the partition, to fuch a degree, that he again revolted; but the unexpected appearance, with the hoftilc preparations of the Saxons, obliged him to fubmit and alk pardon for his offences. Still, however, the ambition of the emprefs kept matters in a continual ferment, and the empire was again threatened with all the calamities of civil war; but before thele took place, the emperor died, in 84 i , after a moti unfortunate reign of 27 years.

Louis was eminent for the nildnefs of his manners and peaceful virtucs, which procured him the titic of Le Debounaire, or, " the gentle:" but fuch was the turbulence and exceflive batberity of the age in which he Lived, that all his virtacs, inkead of procuring him
relfect and entern, were productive only of contempt and rebellion from thofe whom both duty ard nature ounht to have rundered the molt fubailive and obedictit.

The daceufe of the enterar was followed by a cinit wat awong his fons. The united forces of Lothaire and his nepher Pepin were defeated by thote of Charles and Louis in a very bloody battle in the plains of Fontenoy, where 100,000 Franks perihed, in the year 843 . Th's victory, huwever, bloody as it was, did not decide the fortume of the war. The conquerors having, through motives of interent or jealouty, retired each into their own dominions, Lothaire found means not only to recruit his hattered forces, but prefled the other two princes fo vigoroully, that they were glad to confent to a new parition of the empire. By this Iothaire was allowed to poffels the whole of Itoly, with the whole tract of country betwcen the rivet; Rhone and Rhine, as well as that between the Meufe and Scheldt. Charles had Aquitame, with the country ling between the Loire and the Menie; while Louis had Bavaria, with the reft of Germany, from whence he was ditinguithed by the appeliation of Louis the Germar.

By this partition, Germany and France were dif. Divilion of joined in fuch a manncr as never afternards to be unit- the empire, ed under one bead. That part of France which was allowed to Lothaire, was from him called Lotharingia, and now Lorrain, by the gradual corruption of the word. 'The fovereignty, however, which that prince had purfued at the expence of every filial duty, and purchafed with fo much blood, afforded him now but little fati-faction. Difgutted with the cares and anxie-L thaire ties of his fituation, he fought relief in a monatery in refigns. the year 855 . On his retreat from the throne, he allotted to his eldeft fon Louis II. the fovereignty of Italy; to his fecond fon Lothaire the territory of Lorrain, with the title of king; and to his youngelt fon Charles, fumamed the Bald, Provence, Dauphiny, Reign of and part of the kingdom of Burgundy; fo that he Thalles the may be confidered as properly the king of France. Bald. From the year 845 to 857 the provinces fubjected to his juritdiction had been infefted by the annual depredations of the Nurmans, from whom Charles was at latt fain to purchafe peace at a greater expence than night have carried on a fuccelsful war. The people of Brittany had alfo revolted; and though obliged by the appearance of Charles limiclf, at the head of a powerful army, to return to their allegiance, they no fooner perceived him again embarralied by the incurfions of the Normans, than they they of the yoke, and under the conduct of their duke Louis fubdued the neighbouring diocele of Rennes; after which exploit Louis aftumed the title of king, which he tranfmitted to his fon Herifpee. By him Charles was totally defe ted; and his dubjects, perceiving the weaknefs of their monarch, put thembelses under the proteclion of Louis the German. His ambition prompted him to give a ready ear to the propofal; and thereforc, taking the opportunity of Charles's abtence in repelling an invafion of the Dane, he narebed with a formidable army into Sarace, and was folernuly crowned by the archbihop of Sen in the year 857. Being too comfident of fuccet, however, ind fancying himflif alrouly eltablithed on the throne, he was perfuaded

Pare "a dit: German forces; which he had no fooner done, than Charles marched sgant him with an army, and Lnuis a'moned his new kingdom as eally as lie hat ohtamed it.

Ne with unding thi fuccef, the hingdom of Clarles continued ath in vesy toturing fituation. The Xrmon hat hed him in one quarter, and the lineg of Britary in another. He marched againtt the latter in the year Éfo; but had the mivortune to receive a rota difes, afier an engagement which latted two days. The viztur: was chietly ouing to a noted warriur named Robert le Fort, of the Strong, who commanded the Bestons; but Cbarles found means to gain him over to lis party, by inverting him with the title of duke of France, including the country which lies between the rivers Sine and Loire.

For fome time the abilities of R ibert continued to fupport the tottering throne of Charles; but the difficulties returned on the death of that hero, who was killed in repelling an invafion of the Danes. Some amends was indeed made for his lols by the death of the king of Lorrain in the year 869 ; by which event the territories of Charles were augmented by the cities of Lyons, Vienrie, Toul, Befançon, Verdun, Camhray, Viviers and Urez, together with the tertitories of Hainault, Zealand, and Holland. Cologne, Utrecht, Treves, Mentz, Strabburg, with the relt of the territories of Lothaire, were alligned to Louis the German.

All this time the Normans ltill continued their incurfions to fuch a degree, that Solomon king of Brittany was periuaded to join his forces to thofe of Charles, in order to rerel the common enemy. The event proved unfortante in the Normans; for their principal leaders w- belie. $\downarrow$ in Angiers, and obliged to purchafe leare: $\because$ part relinquilhing all the ipoil they had taker. "indes thus freed from a formidable enemy, cran to afpire to the Imperial crown, which about inis time became $\because$ ant by the death of Louis. This belonged of righ : Louis the German; but Charles, having initani. armbled a powerful army, marched with it into Italy betore Louis could be apprifed of his defigns; and being favourably received at Rome, the Imperial cromm was put on his head without any hefitation by the pope, in the year 873 . Louis, enraged at his difappointment, difcharged tis fury on the defencelefs country of Champagne ; and thounh the approach of Charles obliged him for the prefent to retire, yet he continued his preparation wi:h fur vigour, that Charles would in all probabilisy have furu! him a very formidable adverfary, had he not been taken off by death in the year 877. Charles vas no tooner informed of his brother's deceafe, than he invaded the dominions of his fort Louis, wlio poffeffed Franconia, Thuringis, the Lower Lorrairs, with fume ocher territories in that quarter. Ihe enterprie, bonever, prov ed unfuccelfful. Charles, though fuperior in numters, was defeated with great loughter, and had carcely time to reuntite his fattered force:, when he via informed that the Numans had inaded his territories, !.id *alle part of that country, and taken poldiven of the ciey of Roum. France. had he not bein fupplied by the archbimop of Mentz, out of the principle of charity.

On the depofition of Charles the Grofs, Eudes count of Peris was chofen kiug by the nobility during the ninority of Charles the fon of Adelaide, afterwards named Clarles the Simple. He defeated the Normans, and repreffed the power of the nobility ; on which account a faction was formed in favour of Charles, who was fent for, with his mother, from England. Eudes did not enter into a civil war; but peaceably refigned the greatcit part of the kingdom to him, and confented to do homage for the reft. He died foon after this agreement, in the year 898 .

During the reign of Charles the Simple, the French govertument declined. By the introduction of fiefs, thofe noblemen who had got into the poffeffion of gevernments, having thefe confirmed to them and their heirs for ever, became in a manner independent fovereigns: and as thefe great lords had others under them, and they in like manner had others under them, and even thefe again had their vaftals; inftead of the eafy and equal govemment which prevailed before, a valt number of infupportable little tyrannies was erected. The Normans, too, ravaged the country in the moft terrible manner, and defolated fome of the finelt provinces in France. At laft Charles ceded to Rollo, the king or captain of thefe barbarians, the duchy of Neuitria; who thereupon became a Chriftian, changed his own name to Rebert, and that of his principality to Normandy.

During the remainder of the reign of Charles the Simple, and the entire reign of Louis IV. furnamed the Stranger, Lothaire, and Louis V. the power of the

Carlovingian race continually declined; till at laft they were fupplanted by Hugh Capet, who had been created duke of France by Lothaire. This revolution happened in the year 987 , and was brought about much in the fame manner as the former one had been by $\mathrm{Pe}-$ pin. He proved an active and prudent monarch, and pofieffed fuch other qualities as were requifite for keeping his tumultuous fubjects in awe. He died on the $24^{\text {th }}$ of OStober 997, leaving his dominions in perfect quiet to his fon Robert.

The new king inherited the good qualities of his father. In his reign the kingdom was enlarged by the death of Henry duke of Burgundy, the king's uncle, to whom he fell heir. This new acceffion of territory, however, was not obtained without a war of feveral years continuance on account of fome pretenders to the forereignty of that duchy; and had it not been for the afliftance of the duke of Normandy, it is doubtful whether the king would have fucceeded.-AsRobert was of opinion, that peace and tranquillity were preferable to wide extended dominions with a precarious tenure, he refufed the kingdom of Italy and imperial crown of Germany, buth which were offered him. He died on the 20th of July 1030 ; having reigned 33 years, and lived 60.

Robert was fucceeded by his eldeft fon Henry I. who in the beginning of his reign met with great oppoftion from his mother. She had always hated him; and preferred his younger brother Robert, in whofe fawur the now raifed an infurrection. By the affiftance of Rubert duke of Normandy, however, Hemry over--a're all lis encmies, and citablihed himfelf firmly up-
un the throne. In return for this, he fupported Wil. France. liam, Robert's natural ion, and afterwards king of England, in the pofieffion of the duchy of Normandy. Afterwards, however, growing jealous of his power, he not only fupported the pretenders to the duchy of Normandy fecretly, but invaded that country himfelf in their favour. This enterprife proved unfuccefsful, and Henry was obliged to make peace: but no fincere reconciliation ever followed; for the king retained a deep fenfe of the difgrace he had met with, and the duke never forgave him for invading his dominions. The treaty between them, therefore, was quickly broken; and Henry once more invaded Normandy with two armies, one commanded by himfelf, and the other by his brother. The firft was haraffed by continual firmifhes, and the laft totally defeated; after which Henry was obliged to agree to fuch terms as the duke thought proper: but the rancour between them never cealed, and was in reality the caufe of that implacable averfiot: which for a long feries of years produced perpetual quarrels between the kings of France and thofe of the Norman race in England.

Henry died in 1059 , not without a fufpicion of be- plibip: ing poifoned ; and was fuccceded by his eldeft fon Philip, at that time in the eighth year of his age. Baldwin earl of Flanders was appointed his guardian ; and died in the year 1066, about the time that Willian of Normandy became king of England. After the death of his tutor, Philip began to thow a very infincere, haughty, and oppreffive difpofition. He engaged in a war with William the Conqueror, and fupported his fon Robert in his rebellion againtt him §. But after § See Erge the death of William, he aflifted Robert's brothers land, $\mathrm{N}^{\circ}$ sg. againit him; by which means he was forced to confent to a partition of his dominions.

In 1092, King Philip being wearied of his queen Bertha, procured a divorce from her under pretence of confanguinity, and afterwards demanded in marriage Emma daughter to Roger count of Calabria. The treaty of marriage was concluded; and the princefs was fent over, richly adorned with jewels, and with a large portion in ready money : but the king, inftead of efpoufing her, retained her fortune, and difmified the princels herfelf, carrying off from her hufband the countefs of Anjou, who was efteemed the handiomett woman in France. With her he was fo deeply enamoured, that not fatisfied with the illegal poffeffion of her perfon, he procured a divorce between her and her hufband, and prevailed upon fome Norman bifhops to folemnize his own marriage with her. The whole of thefe tranfactions, however, were fo fcandalous, that the pope having caufed them to be revifed in a council at Autun, in the year 1094 , pronounced fentence of excommunication againft Philip in cafe he did not part with the countefs. On his repentance, the cenfure was taken off; but as the king paid no regard to his promifes, he was, in 1095 , excommunicated a fecond time. He again profeffed repentance, and was abfolved; but foon after, living with the counteis of Anjou as formerly, he was excommunicated a third time. This conduct, fo untworthy of a prance, expofed him to the contempt of the people. 'To nany of the nobility followed his example, and at the fame time defpifed his authority ; not only making war up-

## $F R A \quad[G 7 j \quad F R A$

Frares. o: each other, but fpoiling and robbing his fubjects with impunity.

In the year 1115 , Philip prevailed on the court of Rome to have his affair reviewed in an aflembly at Poictiers; where, notwithflanding his utmolt efforts, fentence of excommunication was a fourth time prosounced againt hin. Yet, in ipite of all thefe fentences, as Queen Bertha was dead, and the count of Anjou offered, for a large fum of money, to give whatever affitance was requilite for procuring a difpenfation, Philip at laft prevailed, and the countefs was proclaimed queen of France. But though the king's domeftic affairs were now in fome meafure quieted, his negligence in government had thrown the affairs of the nation into the greatelt diforder. He therefore aflociated with him in the government his eldelt fon Louis. This prince was the very reverfe of his father; and by his activity and refolution, keeping conftantly in the field with a confiderable body of forces, he reduced the rebellious nobility to fubjection, and, according to the belt hiftorians, at this time faved the flate from being utterly fubverted.

For thefe fervices the queen looked upon the young prince with fo jealous an eye, and gave him fo much ditturbance, that he found it neceflary to retire for fome time into England; where he was received by King Henry I. with the greatelt kindnefs. He had not been long at court, before Henry received by an exprefs a letter from Philip; telling him, that, for certain important reafons, he thould be glad if he clofely confined his fon, or even defpatched him altogether. The King of England, however, inftead of complying with this infamous requeft, thowed the letter to Louis, and fent him home with all imaginable marks of refpect. Immediately on his return, he demanded juftice; but the queen procured poifon to be given him, which operated fo violently that his life was defpaired of. A ftranger, however, undertook the cure, and fucceeded; only a palenefs remained in the prince's face ever afterwards, though he grew fo fat that he was furnamed the Grafs.

On his recovery, the prince was on the point of revenging his quarrel by force of arms; but his father having caufed the queen to make the moft humble fubmiffions to him, his refentment was at length appeafed, and a perfect reconciliation took place.

Nothing memorable happened in the reign of King Philip after this reconciliation. He died in the year 1108, and was fucceeded by his fon Louis the Grofs. The firlt years of his reign were difturbed by infurrections of his lords in different places of the kingdom ; and thefe infurrections were the more troublefome, as they were fecretly fomented by Henry I. of England, that by weakening the power of France his duchy of Normandy might be the more fecure. This quickly brought on a war; in which Henry was defeated, and his fon William obliged to do homage to Louis for the duchy of Normandy. As the kings of England and France, however, were rivals, and exceedingly jealous of each other, the latter efpoufed the caufe of William the forn of Robert duke of Notmandy, whon Henry had unjuftly deprived of that duchy. This brought on a new war; in which Loui, receiving a great defeat fiom Henry, wasobliged to make peace upon fiuch terms as hi antagonit thought
proper. Thic tranquillity, however, was but of inow i duration. Louis renenced his intrigues in favour of Wiliam, and endeavoured to furm a confederace againf Henry; but the latter found means not oni, to diffipate thi confederacy, but to prevail upon Hen ry V. emperor of Germany to invade France with the whole fitrength of the empire on one fide, while he prepared to attack it on the other. But L, nuis hav ing coilected an army of 200,005 men, both of them thought proper to defilt. Upon this the king of France would have marched into Normandy, in ordta to put William in poffeflion of that duchy. Hi grea* vaffals, however, told him they would do no fuch thing; that they had affembled in order to defend the territories of France from the invafion of a foreigr prince, and not to enlarge his power by dellronin, that balance which arofe from the king of England? poffefion of Nornaady, and which they reckoned neceflary fot their own fafety. This was folloned by : peace with Henry; which, as both monarchs had now feen the extent of each other's power, was made on pretty equal terms, and kept during the life of Louis, who died in ${ }^{11} 37$, leaving the kingdom to his for Louis VII.

The young king was not endowed with any of thofe cous qualities which conititute a great monarch. Fromawn the fuperitition common to the age in which he lived, y: . he undertook an expedition into the Holy Land, from whence he returned without glory. In this expeditios he took his queen Eleanor along with him; but w.. fo much offended with her gallantries during her flay there, as well as her behaciour afterwards, that he divorced her, and retarned the duchy of Guienne which he received with her as a portion. Six weeks after: this the married Henry dukc of Normandy, count oi Anjou and Muine, and beir apparent to the crown of England. This marriage was a very great mortification to Lous; ; and procured him the furname of the Tiung, on account of the folly of his conduct. When Henry afcended the throne of England, fome wars were carried on between him and Louis, with little advantage on either fide : at laft, however, a perfect reconeiliation took place; and Louis took a voyage to England, in order to vifit the thrine of St Thomas of Canterbury. On his return he was fruck with an apoplexy; and though he recovered for that time, yet he continued ever after paralytic on the right fide. After having languilhed for about a year under this malady, he died on the 18 th of September 1t82, les.ving the kingdom to his fon Philip.
This prince, furnamed The Giff of God, The Masna-Pbilhp the nimoiss, and The Cungucror, during his lifetime; and, as Gre.t. if all thefe titles had fallen thort of his merit, ityled Alugufius after his death,-is reckoned one of the greateft princes that ever fat on the throne of France, or any other.-It doth not, hovever, appear that thefe titles were altogether well foundeal. In the beginning of his reign he was oppoled by a tirong faction excited by his mother. This indeed he fuppreffed with a vigour and fpirit which did him honour ; but his tahing part with the chiidren of Henry 11. of England is their unnatural contefls with their father, and his treacherous combination with John to fize his brother's kingdom when he was detainced in prifon by tik emperor of Germany, mult be indelible ftains in his

## $F$ R A $[63] \quad F \quad R \quad A$

Frare rharacter, and for ever cxclude him from the titic of Masnarmimus. As to military thill and pertomal valour, he was evidently inferior to Richard 1. of England; nor can his recovering of the provinces held by the Englih in France, fiom fuch a mean and datardly prince as King lohn, cnutle him with any julfice to the furnane of conqueror. In politics he was evidently the dupe of the pope, who made ufe of him to intimidate John into a fubmilhon, by proming him the kingdom of England, which he never meant that lie fhould eni $\because$. An account of thefe trandactions, which are the principal ones of this reign, is given under the artiile Exiland, No 121 - ${ }^{1}+1$.

Philip died in 1223, and was fucceeled by his fon I. vis T11I. and he, in 1226, by Lowis 1X. afterwards Ityled of Lovic. This prince was certainly pofiefled of many good qualities, but deeply tinctured with the laperiftition of the times. This induced hin to ensage in two croifader. The firt was againt the Saracens in Egyt: in which he was taken prifoner oy the Infidels, and treated with great cruelty; but at lat obtained his ranfom, on condition of paring a million of pieces of gold, and furrendering the city of Damietta. He no tooner regained his liberty, than ie entered Syria with a view of doing fomething worthy of his rank and character. From this expedition he was obliged to return fooner than he intended, by the news of the deceafe of his mother Queen Blanch, shom he had appointed regent in his ablence, and who had managed the national affaire with the greateft prudence. The hing, however, found many dilorders in the kingdom upon his return; and thele he fet timfelf to reform with the utmoll diligence. Having fucceeded in this, he yielded to Henry 111. of Lngland, the Limouin, Querci, Perigord, and forme other places; in confideration of Henry and his fon Prince Edward their renouncing, in the fullett manner, all pretenfions to Nurmandy and the other provinces of France which the Englih had formerly poffeffed.

The reputation of this monarch for candour and juftice was fo great, that the barons of England, as well as King Henry 1II. confented to make him umpire of the differences which fubtiled between them. But though he decided this matter very juttly, his decifion was not productive of any good effect. At latk the king, having fettled every thing relating to his kingdom in a proper manner, fet out on another croiinde for Africa; where he died of the plague, on the 25 th of Auguit 1720.

Nutwithtanding the misfortunes of Louic, his fucceffor Philip, furnamed the Hardy, continued the war againit the lufidels with great vigour. Being rein- forced by his uncle Charles hing of Sicily, he brousht the war to a mose fortunate conclufion than his predeceffor had been lihely to do. The Saracens were defeated in two engagements, and the king of Tunis obliged to fue for peace; offering at the fame time to doukle the tribute he formerly paid to the crown of Sicily; to remburie the expences of the war; and to permit the Chintian religion to be frecly propagated throughout his dominion-. Having accomplihed this, the two princes fet dail for Europe; but the feeds of the diftemper which had infected the army in Ifrica atot leing eradicated, bruac forth on their arrival in Sicily, and raged for fome tinse with grent violence,

Betdee a ran number of common pocple, the hirg's Erance. brotlier Jon, his queen l'abella, with his brother and fitte-in-law the king and queen of Navarre, and his uncle and wunt the count and countefo of Poictiers, perithed by this dreadful malady.

Oat his return to France, Philip took porfeflion of the counties of Provence and Thouloule ; married his fecond lon, though then very young, to the only daughter of the king of Navarre ; while he himfelf efpouled Mary the daughter of the duke of Brabant, reckoned one of the moft beautiful princeffes of the age. He Iteadily enforced the regulations of his predeceflor, who had prohibited the barons from making private wars upon one another; procured the friendinip of Edward I. of England by coding to him the county of Agenois; and entered into a war with Spain in order to fupport the pretenioas of his nephers, the Infints de la Cerda, to the throne of Caltile.

The events of this wat were of no great importance; and the king's attention was quichly called of from them by the death of his eldeft fon Louis at the age of twelve years. This difaffrous event happened in the year 1275 , not without a fufpicion of poifon; and the young queen, Mary, was accufed by a furgeon named La Broffe as guilty of his death. Philip gave fome credit to the accufation: but having applied to a nun, who pretended to be infpired, for full fatisfaction, her anfwer proved fatal to La Brofle. The queen being cleared by this pretended prophetefs, La Broffe was accufed of a treafonable correfpondence with the king of Caftile, and condemned to death. The manner of his trial and execution, however, were fuch, that the tide of popular favour was turned; La Broffe was by the roice of the people declared to be imnocent, and the king and queen themfelves loudly condemned. During thefe unfavourable circumitances, the Sicilians, over whom Charles of Anjou had eftablithed his authority, inftigated by John of Procida, a noble exile, came to a refolution of freeing themfelves at once from the French yoke by a general maffacre. This cruel refolution was accordingly put in execution; and the French, to the number of 8000 , murdered in one night; after which Peter of Arragon, failed to the illand, where he was received by the inhabitants as their king and faviour. Charles was fenfibly affected by this misfortune : and having laid fiege to Melfina, failed directly to Marleilles, where he obtained a powerful reinforcement. But during his ablence on this occafion, his fon, to whom he had intrufted the care of the dege, having rahly ventured an engagement with the Spanith fieet, was entirely defeated and taken prifoner, which fo much affected the father that he died of grief, and Sicily was infeparably attached to the houte of Arragon.

The misfortunes of Charles were followed by others equally great to Philip himielf. Pope Martia IV. in the warmth of his zeal for the caufe of the durie of Aujou, had excommunicated Pedro king of Arragon, and bettowed his kingdom on Charles of Valois, a younger fon of the king of France. In att-mpting to defead himfelf againft the execation of this unjut fentence, Pedro was mortally wounded; but, foon af. ter, the French fleet being defeated by that of Arragon, the king was io much affeted by the mifortune that he fell fick. His difeafe was zugnented by the

## F R A $\quad\left[\begin{array}{l}\mathrm{g}\end{array}\right] \quad \mathrm{F} R \mathrm{~A}$

Frace beat of the ciimate and the fatigues of war ; io that, quite wern out with grief and imirmities, he apiral
 his reign.

By the death of Philip the Hardy the French crown devolved on hi, fecond fon, called alio Philip, and from the beau:y of his perion furnamed the Fair; who hat eipowed the princefs of Navare, and at the time of his acceffion was in his 1 the year. By the marriage with this princels he had obtained the counties of Champagne and Brie; yet with all this increate of fuwer he found himelf unable to fupport the war in which his predectillur had engaged. For this reaton he thought proper to abandon the interelt of the Infants de la Cerda, and fettle the differences with Caftile. The treaty was concluded by the miediation of Edward I. of England; at whofe intercelfion Charles the Lame, fon to the duke of Anjou alreatly mentioned, was releafed from his captivity; Elward himfelf paying part of his ranfom. On this Charics confented to renounce his claim on Sicily; and Philip himfelf promiled that his kinfman Philip of Valuis thould renounce all pretenfions to the crown of Arragon. In return for this generofity, the latter obtainel the eldelt daughter of Charles, with the territuries of Anjou and Maine as a dowry.
The tranquillity procured by this treatr, howeser, was foon interrupted by differences with Ldward the promoter of it; Pope Bonifice VIII, and Guy de Dampier, count of Flanders. The diference with England took place by a mere accident. A Norman and an Englifh veffel having met of the coant of Bayonne, and having both occalion fur water, the crews met and quarrelled at the fame fpring. A Norman was killed in the fquabble by his own weapon, with which he aifaulted an Englihman, as the latter pretended: but however the matter was, complaints were made by the Normans to Philip: who, without giving himfelf much trouble to inquire into the merits of the caufe, initantly allowed them to redrefs their fuppofed injuries. On this a kind of piratical war commenced between the two mations, in which the two fovereigns for fome time took no active part ; though other nations interfered; the Irihh and Dutch feamen fiding with the Englih, and thofe of Flanders and Genoa with the French. Thus the powers on both fides were gradually augmented, till at latt the affiar became fo ferious, that in one engagement 15,000 French are faid to have perilied. Philip, alarmed at fuch a carnage, fummoned the king of England as his valfal to attend; and, on his refufal, dectared his eilates in France to be forfeited. After a number of negotiations, Philip declared that he would be fatisfied with the nominal cetion of the province of Guienne, which he engaged initantly to retore to the King of Engluth as foon as it thould be put into his hands. Elward complied with his demand; hut no fugner t.al the French monarch obtained pofielion of that coantre, than he perlifted in the forleiture of the Englinh potfellions in France; wlich treacheroes 1 rocecesin. y i:nfantly produced a war betwist the two nation. E.dward, that he might defend himfelf the tee:ce aggimet fuch a formidable adverlary, concludnla tway with the emperor Adolphus, together with t.ic cuint of Brittany, Holland, Bas, Juliest, Gueldaw, and Elan-

 hand, and detroyed the toma (i: Duser: aite Le. ward, in revenge, landel in Cisoy with an army of
 formed with this mighty armame:t ; and luth furio finding thenfelves prety equally matched, contrat to a fufpenfion of atm for tho ge.:s ; during which a peace was fronl!y curcluded by the mediation o: Pope so Bonizace Vill. Guieme sas rettred. Edwardfeaci wor. efpouied Margaret the fiter of Phiiap; while his ciuded. daughter liabella was given in marriage to the prince of Wales.

Both Philip and Edward behaved to the allies whom they had engaged in their caufe with equal perfidy. Bufiol was abandoned by Philip to the reientment of Edward; while Guy, earl of Flanders, was left equally expofed to the relentmont of Pliilip.

The recunciliation betwist the 「rench and En lihn ons monarchs was toon followed by a difikence with Pupe wh pope Boniface, whom they had appined mediator between ${ }^{\text {emma.e. }}$ them. Senfible of his alluming difpotion, however, they had inferted in the reference made to him, that he was chofen as a private man, and not as the lucceffor of St Peter. The haughty pontia, however, fonn thowed, that he war not sy any men: to be treated as a priwate perfon, and a conteit with Philip quickly emfued. Bomiface began with forbiduins the clergy to grant the hing any fublidies withot: firlt obtaining the con'ent of the Huly See, u:let tha pain of excommunication. Philip revenged himeif ty prohibiting any ecclefialtics from fending money out of the kingdom without his leave; and iy protecting the Colornas, who were the inplacable enemies of Boniface. By this his holinels was bo much imetated that be fent a moll abufive letter tu Philip; ates which be fummoned the cletgy of Frince to a council at Rume; which Philip retaiated, by feizing the terrporalitics of thofe who obeyed the fumnen, and recalling his brother Charles of Valuis, who laad the title of the Pape's Gencral. Sulithe, however, of tie dager that attended this contelt, he defratched two eminiaies, under pretence of conciliating the differences, to levy fuch a body of troops as might esecute hi hoitile purpufes again!t the holy father. With thele he fudtenly invelted the pope in his native city of Anegnia; and while the bull was preparing for the excomnunication of Philip, and releafin, his f.beets from their obedience, the pupe hinatelf was nobiged to farrender frifonce to the troors of the prince whom he dengmed ts and hematize.
Though Bonifice hal been $\cdot \mathrm{t}$ : tis time dellivered up the tromps of Phitif througls the treactery of the

the papal clair for Bertrand archbilhop of Bourdeaux, frovided he would condemn the memory of Boniface, rellore the honours and eflates of the Colonnas which had been forfeited, allow him, for five years, the tenths of the clergy of France, and comply with a requelt which at that time it was not proper to divulge.

Bertrand having complied with the terms propofed by the king, afcended the papal throne by the name of Charles $I$. but narrowly efcaped being killed on bis return from the cathedral of Lyons, by the falling of a wall which had been overloaded by the number of people who came to fee the proceffion; by which acci-

Tre Pop
fises his ie fidence at Avignon. dent the duke of Brittany was killed, and the king and count of Valois confiderably bruifed. The new pope fised his refidence at Avignon, where he punctwally complied with all the conditions of the treaty, except that of condemning the conduct of Boniface, which he abfolutely refufed to do; and, initead of doing fo, vindicated it with much folemnity, after having inguired into the matter, or pretended to do fo. The other condition, which Philip had at firf concealed, was difcovered by the death of the emperor Albert of Auftria; after which event he defired Clement to allift him in placing his brother Charles of Valois on the Imperial throne. But his holinefs, apprehenfive of the danger which might accrue to himfelf from being furrounded with the powerful relations of Philip, urged the diet to proceed inflantly to an election; recommending to them Henry of Luxemburg as a proper perfon to fill the Imperial throne. In this fcheme he fucceeded fo well, that the election was over before Philip could arrive at Avignon; and the only confolation the French monarch could obtain for his difappointment was the poffeffion of the city of Lyons, which had hitherto maintained an independency under its archbihop; but was now perfuaded to fubmit to the anthority of Philip.
5.4

Expedition of Philip agamft the earl of Flanders.

In the mean time Guy, earl of Flanders, being abandoned by his ally Edrard king of England, was obliged to throw himfelf on the mercy of the French monarch, who had fent his brother, Charles of Valois, with a powerful army to invade his dominions. From the latter indeed he had obtained a promife, that if he could not, within a year, compofe the differences fubfifting between him and Philip, he fhould be at liberty to retire, and purfue what meafures he pleafed. But Philip, in order to gratify the refentment which his queen entertained againt the captive prince, detained him, with two of his fons, in clofe confinement, while he himfelf entering Flanders in triumph, was everywhere received as fovcreign of the country; and at his departure appointed John de Chatillon, a relation of the queen, to govern thofe newly acquired territories.

The new governor took care to repair the fortifications which had been fuffered to decay by reafon of the affiduous application of the Flemings to trade; but being of a very haughty and tyrannical difpofition, and the poverty of the times not allowing his mafter to keep regular garrifons, an infurrection quickly took place. This would have been effectually quelled by the diligence of the magiftrates, had not Chatillon unluckily entered Bruges, and publicly difplayed two hogtheads of ropes, which he threatened to employ in the cxecution of the inhabitants. On this they tlew
to arms, and maflicred $15=0$ French; Chatillon himfelf being obliged to efcape their fury by fwimming over the town ditch. 'The infurgents, now daily gathering flrength, foon amounted to an army of 60,000 men, who laid fiege to Courtray. Here they were rafhly attacked in their trenches by the count d'Artois, who met with the reward of his temerity, being cut off with 20,000 of his troops Philip determined on revenge; though the raifing another army obliged him to debafe the coin of the kingdom. Thus, however, he was enabled to enter Flanders with fuch a force as would probably have fubdued the whole country, had not Edward artfully communicated to the queen of France, as a fecret, a feigned corretpondence between the French nobility and the court of Rome ; by which falfe intelligence the king was induced to abandon the enterprife without performing any thing worthy of the armament he had fitted out. The war was continued for fome time longer; but the attempts of Philip were contantly defeated by the fteady valour of the Flemings; and the only recompenfe Philip obtained for all his trouble and expence was the city of Courtray.

The other remarkable tranfactions of this reign were Expulition the expulfion and confifcation of the eftates of the of the Templars, who at that time enjoyed immenfe poffef- knights fions in France. The confifcations took place without any form of tial, and upwards of 50 of them were put to death in a cruel manner. The grand mafter, with three of his principal officers, were burnt by a flow fire in the prefence of the king himfelf. The whole body of thefe unfortunate knights had been accufed of the moft grofs and abominable fenfualities. The particulars were revealed, or pretended to be fo, by two criminals who received their pardon for the difcoveries they made; and thefe difcoveries were confirmed by the confeflion of the Templars themfelves. But this confeffion was afterwards retracted, as being extorted from them by the fear of abfolute deitruction; and thofe who fuffered, maintained their purity to the laft: and on the whole, it was believed that Philip confulted his avarice rather than his jullice by this cruel execution. The latter part of his life was embittered by domeftic misfortunes. His three daughters-in-law, Margaret daughter of the duke, and Jean and Blanch of the count, of Burgundy, who had married his three fons, Louis, Philip, and Charles, were accufed of infidelity to their hufbands. After a fevere examination, Margaret and Blanch were condemned to perpetual imprifonment ; in which fituation Margaret was afters wards firangled by order of her hubland Louis. Their paramours, Philip and Walter de Launay, two brothers, were llayed alive, and afterwards hung upon a gibbet, with an ufher of the chamber, who had been their confidant. The unealinefs of mind which Plilip fuffered on this account is fuppofed to have impaired his health, and he died of a confumption in the year 1395, the $4 ;^{\text {th }}$ of his age, and 3 oth of his reign.

On the acceffion of Louis, furnamed the B iferous, Reign of on account of his violent temper, he found his treafury Lous the fo much exhaufted, that he was obliged to delay for vilterous fome time the ceremony of his coronation with his new queen Clemence, daughter of the king of Hungary. Finding the kingd m otherwife in a very diftracted ftate, he applied himfelf very diligently to appeafe the difcontents of his fubjects, and conciliate their affection

## F R A [ 71 ] F R A

France. by every means in his power. In this he was affilted
Cr by his uncle Charles of Valois, on whom he at length entirely devolved the government of the kingdom. This regent, however, behaved with fuch cruelty as is luppofed to have proved fatal to the hing himfelf; for having put to death a nobleman named Eņuerrand de Poitier do Marigni, who enjoyed the confidence of the late king, this cruelty was of much refented, that his friends were thought to have adminitered poifon to the king; who expired fuddenly after dinking a glals of cold water, in the 26th year of his age, and fecond of his reign. Immediately after his death, Charles prepared to difpute the fovereignty with the brothers of the late fovereign. Philip count of Poictou, the cldelt brother, was at that time at Rome affilling in the election of a new pope; and it was not until a month after the death of his brother that he was able to put an end to the intrigues which took place on that oceafion: but on his arrival in France, the throne was affigned to him by the unanimous roice of the people. His profpects, however, were for a thort time clouded by the queen dowager Clemence being delivered of a fon, who has been enrolled among the kings of France under the name of $76 / \mathrm{in} I$. His death in three weeks fecured the throne to Philip; who, on account of the tallinefs of his flature, was furnamed the Lons. His conduct proved fuperior to that of his predeceflor, who bad unfuccefofully attempted to fubdue the Flemings, and had cven fuffered himielf to be duped by tbeir count ; but Philip, by his vigorous behaviour, fo reduced them, that they compelled their fovereign to confent to a peace upon honourable terms. He fummoned Edward Il. of England to do homage for his polleffons in France; but that monarch, finding himfelf invelved in difficulties, which rendered the vint inconvenient, fent excufes to Philip, which he was pleafed to accept. As the French monarch had formerly taken the crofs during the lifetime of his father, he now propofed to put his vow in execution; but was difiaded from this by the pope hinifelf, at whofe inflance he fent an army isto Italy to put an end to the contending factions of the Guelphs and Gibbelines, who for fo long time filled the country with blood and flaughter. The event proved unfortunate; and the difgrace was rendered more mortifying by a contagious diftemper, which frept off many thowfand of French fubjects. This was fuppofed by the fuperlitious people of thote times to be occafioned by the Jens, who had confpired with the Saracens to poiton the frings; and that the execution of the project was committed to fome lepers who lived by themfelves in hofpitals richly endowed. On this a perfecution was inflantly conmenced againft thefe unfortunate men, and great nunters of them were bunt aiive; while the Jews in general were abandoned to the rage of the populace, who infuited their perfons, and plundered their houfes without rcmorfe.

The remaining part of the reign of Philip was fpent in attempting to regulate the intemal concerns of his ringdom. A detign had been formed by his predecefiors of eitablihing a certain itandard for the coin, weight, and meafures, throughont France: and this was adopted by Philip; who, in order to carry it more efle atually into execution, purchafed from the counts st Valn, Clermort, atd Buarbon, their night of
coinage within their own dominione. But notwith- Frince. Itanding all his endeavours for this purpo'e, he never could bring the fcheme to bear: nor indecd could he in any degree conciliate the affection of his fubjects. He died of a fever and dylentery in tlee year 1322 , the 28th year of his age, and 6th of hiv reign.

By the death of Philip, the crown of France de-Rugn of volved on his brother Clarles IV. who had obtanised hiries the" the furname of Fair. After fettling fome difputes with Fair. the duke of Burgundy, his next itep was to diffolse his marriage with Blanch, who flill continued in prifon, and to efpoufe Mary the daughter of Henry emperor of Germany, This marriage was contracted with a view to the Imperial crown itfelf, which had been fo long feparated from that of France; and in 1325 an opportunity offered for Charles to gratify his ambition. At that tinae the Imperial dignity was difpated between Louis of Bavaria and Frederic of Auitria; the latter of whom had been taken prifoner in a battle with Louis. But Pope John, who entertained an implacable hatred againft Louis, fulminated the fentence of excommunication againft him, intrulting the enecution of it to Leopold the brother of Ferdinand. The king of France was induced to embark in the fame caufe, by a promife of the fpoils of Bavaria; while Frederic himfelf confented to relinquilh his pretentions to the empire which he had fo unfuecerstully maintined. Loui*, however, by inftantly releafing his prifuner, and difmilling him in an honourable manner, engaged his friendhip, and difarmed his moft formidable antagonift. But the pope was not to be fo dilappointed. A confiderable fum of moncy induced Leopold to perfevere in his holtilities, while it was determined that a new council of electors fhould be held in order to transfer the Imperial crown to Charles. In purfuit of this vifionary fcheme, the king of France tet out for the frontiers of Germany with a fplendid army; but foon found that there was no poffibility of accomplilhing his withes. Leopold alone, from motives of intereft, remained his friend; the relt fhewed the greateit indifference; and even his brother-in-law the king of Bohemia abiented himfelf frum the diet; while in a hort time the death of the queen put an end to all connexions with that crown.

On the deceafe of Mary, Charles efpoufed Joanna daughter to the count of Evreux: and is order to wert the calamities to be feared from an infant fucceffron, he entered into an alliance with Robert hing of Scotland; by which it was provided, that hould either of the fovereigns die without an keir apparent, the ftates of the kingdom thould fill the vacant throne, and the furvivor of the two kings thould with his whole force fupport the legality of the numination agninil any other competitor; though evea this proved infufficient to avert the danger which now threatencd the kingdom, as hall be explained in the fequel

Chatles died in the year 1328 , in thew 34 th year of Canususers his age, leaving his queen pregnant; and as the fuc-torthe receflion depended on the fruit of the queen's pregrancy, angdonion a regent in the noma time was necelary; and two can- the de th didates initantly appeared fur this important puit, of charle:. urging at the fame time their right to the crown as vell as to the regency. Thele were, Philip de Valois, condin-cerman to the deceafod king; the other, Edwad III, king of England, who alpired to the throne

## i if A

 Fair. lils pretenions, however, were eafly fet afide, and Philep was contirmed in the regency: from which he foon after iteppes into the throne, on the queen bing delivered of a daughter; from which circumhance he acpuired the furmme of Forthatite. But though the pretemimas of Eiward, both to the regency and crown, fice unamoutly rejected ly the people, it was thli impolible for Phifip to think of the clains of fuch a fomidable asal without uneafinefs. He therefore fummoned the Englih monarch to do howage for his judellom in France; and, upon his not andivering hi, fummons, forfeited them, and feized his revenue. This at lat induced Edward to crofs the fea and pay his homage; which Philip confented to receive in any form, upon condition of a proper explanation being atterward given : but as this was fludioutly delayed diter the return of the king of England, the province of Guieune was again feized by the T: nch monarch. Edward, unwilling to lofe his coninental dominions, or involve himfelf in a war for the fake of a mere ceremony, fent over a formal deed, by utich he acknowledged that he owed liege homage to Fame. Thus the flame was fonothered for the pretent; and nould pernaps have been entirely extinguined, had it :2x been for the intrigues of Robert of Artoi, brother-in-law to the king of France himfelf, who had been expellec' his country, and had taken refuge in England. By him he was perfuaded to renew his pretenfiuns to the crown of France, which of neceffity produced a war.

For fome time, indeed, neither party made any open declaration of bothility; but as both monarchs were poffeffed of great prudence and fagacity, they foon penetrated each ocher's deligns. Philip, under pretence of taking the crofs, began to make prodigious armaments, firengthening himfelf at the fame time by alliances on every fide ; while Edward, determining to renew his claim to the crown of France, projected the conques of Scotland. This, however, he could not accomplili ; and in the mean time Philip, in order to Lav vur the Scuts, with whom he was in alliance, fuffered his fubjects to make irruptions into Guienne.

1:1 13:37, the war bruke out openly. Philip having detached a fquadron of his fleet againft the Infidels, emploved the rell, coniming chielly of Genoefe veffels, agamit the Englith. As in this war it was of great imfortance which ide was taken by the Fienings, thete people were courted by both parties. Louis count of Elanders declared for Philip, but his fubjects were more inclined to King Edward. James Arteville - brewer, the mott able and artful man in the coantry, yoverned them at that time as much as if he had been $\therefore$ cir prince; and the advantages ariing from the Enelin commetce determining lim in favour of Ed…sh, that prince, at his requett, enbarked for Sluys ..ith a nome row army. Here he arrised in 1338; and - Lis fint landius, it was refoliced that the German ;inco in allance with lim fhould aet againf France. Pat for this a pretence was wanting. The vafals of the empre could not at by Edvard' order, or even a Alli-, withou: directions from the emperor, and " v... in lague with France. This difficulty, howaer was fo toveronet, the Fravel had mate them-

that it thould be retaken. With this view he created Edward $l$ 'icar Gencral of the Empire; an empty title, but which feemed to give him a right of commanding the fervices of the princes of Germany. The Fleming., who were valials of Fiance, likewife pretended fruples at invading the territories of their liege lord. To quiec the le, Edward, by the advice of Arteville, aflumed the title of King of France; and by virtue of this right challenged their afliftance for dethroning Philip de Vabis, the ufurper of his kingdom. This flep, which he feared would beget endlefo animofitics and jealoufie, he did not take without hefitation; and, according to Mr Hume, from this time we may date the commencement of that great animofity which the Englifh have a!ways born to the French.

Edward's firlt attempt was upon the city of Cambray, to which he laid fiege; but in a fhort time he was prevailed upon by Robert d'Artois to raile the fiege and march into Picardy. This country he entered with an army of near 50,000 men, compofed montly of foreigners. Philip came within fight of him with an army of near 100,000 , compofed chiefly of native fubjects; and it was daily expected toat a battle would enfue. But the Englifh monarch was averfe to engage againit fo great a fuperiority: and Philip thought it fufficient if he eluded the attacks of his enemy, without running any unneceflary hazard. The two armies faced cach other for feveral days; mutual defiances were fent ; and Edward at laft retired into Flanders, and difperfed his army.

Such was the fruitlefs, and almoft ridiculous conclufion of Edward's firf expedition, which had plunged him into the greateft difficulties. He had contracted near $300,000 \mathrm{l}$. of debt; he had anticipated all his revenue; he had pawned every thing of value which belonged either to himielf or lis queen; nay, he was obliged in fome meafure even to pawn himfelf to his creditors, by defiring their permifition to go over to England in order to procure fupply, and by promifing on his word of honour to return in perfon if he did not remit their money. On lis arrival in England, however, he procured a large dupply, fudicient to enable him to make all the neceffary preparations fur a new invafion; and fo certain were the Englifh that France would now be conquered, that the parliament, before Edward's departure, protefted that they owed him no obedience as hing of France, but that the two kingdoms muit remain for ever difinct and independent.

The king of England fet out on his fecond expedi-His fecond tion with a fleet of 240 veffels. Philip had prepated xpedtion, a theet of 400 veffels, manned with 40,000 men; which he flationed off Sluys, in erder to intercept him in his paffage. The two tleets met on the $13^{\text {th }}$ of Jwine $134^{\circ}$; but the Engilih, either by the fuperior abilities The ${ }_{3}{ }_{3}$ of Edward, or the greater dexterity of his feamen, entitely degained the wind of the enemy, and had the fun iufeated at their backs; and with theie advantages began the a....a. tion. The battle was fierce and bloody: The Englihh archers, whole force and addrels were now mu h cele. brated, galled the French on their apprach; and when the thips grappled togeeter, the eample of the king an! the nobility who were vith inm to anmated the femen and fulliers, that they mantaned everywhere a fuecriority over the enemy. The Fleming chfering the but!le, hurnied ous of thair prots, and

France. b:onfta a rintorcement to the Erglik! ; whicu coming uncapectedly, had a greater effect than in proportion to its power and numbers. Two hundred and thity thips were taken: and 30,200 Frenchmen were killd, with two of their admirals: the lof of the Englith was incontiderable, compared to the greatnels and importance of the victury. None of Philip's couriers, it is faid, dared to inform him of the event; till his tool or jeller gave him a lint, by which he difcovered the lofs he had fulained.

After this great vietory, Edward landed his forces and laid fiege to Tournay. Philip marched to its relief with a very numerous army: but aited "ith io much caution, that Edward found hinfelt in a manner hoched $u_{p}$ in his camp: and the countefs dowager of Hainault, filer to Philip, mother-in-low to Ldward, and fifer-in-last to Robert d'Artoi, coming out of a convent, to which the had retired, interpoled with fo much finit and aadrefs, that the engaged all paties to agree to a truce for a year, and might perhaps have 64. brought about a peace if the had furvived.

Idward in. In I $3 \neq 1$, however, Edward's ambition was once rited into more excited by the invitation of the count de MountFrarce a thad time. fort, who had poffefled himfelf of the province of Brittany, and applied to Edward to fecond his claims. An offer of this kind entirely coincided with Edward's molt fanguine delires. He was happy in the promifed amfance of Mountfort, an active and valiant prince, cletely united to him by interell, and thus opening to him an entrance into the heart of France. Thefe flattering profpects, however, were for a while damped by the imprifonment of Nuuntfort; whofe aims being difcovered, he was befieged in the city of Nantz and tahen. But Jane of Flanders his wife foon made up for the lofs of her hutband. This lady courageounly undersook to fupport the falling fortunes of her family. She afembled the inhabitants of Rennes, where the then relided; and carrying her infant fon in her arms, deplored her misfortunes, and attempted to inf ire the citizens with an affection for her caufe. The inhabitants of Nantz inftantly efpoufed her intereits, and ail the other fortretes of Brittany embraced the fame refolution. The king of England was apprifed of her efforts; and was entreated to fend her fuccours with all yolible expedition to the town of Hemetone, in which place the reiolved to fultain the attacks of the enemy. Charles de Blois, Philip's general, ansious to make himfelf matter of fo important a fortref as Hennebone, and fill more to take the countefs a prifuner, fat down before the place with a large army, and conducted the tiege with indefatigable indultry. The defence was no lefs vigorous: feveral fallies were made by the garrifon, in which the countefs herfelf war taill the moll active, and led on the aflault. Obferving one day that their whole army had quitted the camp to join in a general form, the fallied out by a pofern at the head of 300 horfe, fet fire to the enemies tent, and baggage, put their futtlers and fervants to the fword, and occafioned fuch an alarm, that the French defited from the aflault, in order to cut off her communication with the town. Thus intercepted, the retired to Auray, where fhe continued five or fix days, then returning at the head of 500 horfe, the fought her way through one quirter of the French camp, and returned to her faithfal citizens in triumph. But the beloger had at Yol. IX. Part I.
length mod. .............................. i
 espected, woukd be tant. A ca itulation was them. fore propo\{e, and a confanice in. ..lteasy begu\% when the crusta, who had monned on at high toves, and was booking towar? the lat with meat impatience, deferied lome thips at a cilkunc: Sice immediatel) exclaimed that iuecuars were arrived, and tiortade any further capituation. She was not diapounted in lett wihes; the the she difemed cartid a borly of Enslith gentlemetr, with $6=00$ archers, whom Etwar I had repared for the relicf of Hennebane, but who had been long detained by contrary wind. They entered tler harbour under the cuaduct of Sir Waher Manay, ons of the mot valimit commanders of his time. This re lief ferved to heep up ti.e declining $f_{\text {pirits }}$ of the Bt tons until the time appointed by the lite truce with Edward was expired, on which he was at libenty to r new the war in greater form.

The fuccours under Sir Walter Manny were quich! followed by a more confiderable reiniorement carimanded by Robert of Artoic, who made himfeli mafter of the city of Vannes foon after his anrival: but the Freach foon recovered the city, and Rubent was compelled to relinquith his prize after receiving a nortal wound. Edward himfelf, eager to revenge the death of his ally, foon landed at Morbian near Yames with an army of 12,000 men. With this fmall number he undertook at once the nege of Vannes, Nantz, and Rennes: but by dividing his forces, he failed in evory enterprife, and gave an opportunity to John duke of Nirmandy, the king of France's eldeli for, to inveit him in his canp. In this tituation his provilions foon began to fail; and Edward, notwithfianding all his valour, would have been obliged to furrender, had he not, by a train of artful negociations, induced Philip to relimquih the advantage he had obtained, and cot.fen: to a truce of three years. This was accomplined by the mediation of the count of Rone ; and the French monarch was foon made lenvible of the partiality of that count, and the imprucence of the tiep lie kiniclt had taken. Ldward foon found a pretence to renew the war, from the execution of fome nobles of Brittany, 'who, he faid, were partilans of Mountfort, and chote to look upon their puniliment as an infraction of the treity.

Philip now endeavoured to lecure himfelf againft the power of his rival by alliance, and by purchafing the city of Nontpelier from the king of Majorca: but in the mean time, the Englih, under the command of the earl of Derby, had invaded Guienne, twice defeated the French army commanded by the Count de Lile, and made themfelves maticis of a great number of towns. Philip, by reafon of the exhauled tate of his tretiury, was for fome time incapable of making any oppofition. To recruit luis finauses, he was obliged to lay a duty on falt; which gave fuch offence to his fubicits as had almofl eacited a rebellion. When thele difcontents were affugged, however, he foon raifed an arry of $10,, 2=0$ men, whofe courage was furihar railed by the prefence of the dukes of Normandy and Bargundy. The Engith general was therefore compelled to thand upon the defentive. One tortaefs after another wo furrendered to the French; till at lengila nuibing apmeaned but a total estituction of the powe:

France of Lag'and upen the contrent. In this fituation, Edward refulved to bring relief in perfon to his diftreffed fubjects and alies; and accordingly embarked in 1346 at Southampton, on beard a fiect of near 1200 fail, of all dimentions. He carried with him, befides all the chief nobility of Erytand, his eldeit fon the prince of Wales (afterv"ards furnamed the Block Princt),

Calais t2ker. a youth of abeut 15 years old, and already remarkable both for undertanding and valour above his age. His army confitted of 4000 men at arms, 10,000 archers, 10,000 trehm infantry, and 6000 Irih; all which he landed fafely at La Hogue, a port in Normandy, which country he determined to make the leat of the war.

The intelligence of Edward's lanting, and the devafation caufed by his troops, who difperfed themfelves over the whole face of the country, foon fread univerfal contemation through the French court. The rich city of Caen was takern and plundered by the laglifh without mercy ; the villages and tonns, even up to Parie, hared the fame fate; and the French had no oher rctource but by treaking down their bridges, to atterpt puting a itop to the invader's career. In the mean tim:, Philin was not idle in making preparations to repref the enemy. He had ftationed one of his generals, Godemar de Faye, with an army on the oppohte f.de of the niver Somme, over with Edward was to puis; while he himfelf, at the head of $122,=-0$ frghting men, advanced to give the Englih battle. Llward, thes unexpectedly espofed to the danger of being enclofed and larved in an enemy's country, publifhed a reward to any that thould bring him inteltigence of a paffage over the river Somme. This was difcovered by a peafant of the country, named Gobin Agace: and Edward hatt juft time to get his whole army over the river, when Philip appeared in hi rear. Of the battle that enfued, in which the French were overthrom with great haughter, an account is given under the article Cressy.

Edward next laid fiege to Calais, which was then defended by John de Vienne, an experienced commander, and fupplied with every thing necellary for defence. It was at length taken, after a twelvemonth's fiege, the defendants having been recuced to the late extrenity by famine and fitigue ; for the confequences of which, fee the article Cilais.

From the very beginning of this tunfortunate war, Philip had invariably f.owed himfelf defirous of peace, and the victory of Crelly rendered him thll more fo. Edward alio notvithifanding his fuccefle, was unable to fupport the expences of the war any longer. The mediation of the court of R ome was therefore readily accepted, and a truce for threc years concluded. At the fame time, Philip met with fome recompenie for the lofes he had futtatacd, by the acquiftion of Dauphiny, which has ever minee given the title of Douf hin to the -ldeft fon of the king of France. It nos obtained by the relignation of Hubert prince of Dauphiry; who, being difappointed in his hopes of marrying Joan, daughter of the duke of Bourbon, gave up his territories to Charies the grandion of Plilip, who had maried that lady; himfelf retiring into a convent. Soon after this event, the king himelf, who had been fome time a widower, was married to Blanch, the daughter of Philip count of Evrcux, and Jane rueen of Natarre; as.d Lis
fon John to the countefs of Boulogne. But the hap. France.
pinefs occafoned by theie marriages was foon interaptcd by the death of tle hing; who expired in the year Death of $1355^{5}$, the $57^{t h}$ of tis age, and 23 d of his reign.

Oa the death of Philip his eldelt fon John took pof-ip. feffion of the kirgdom ; but fcarcely was he feated on the throne, when he digulted his nobility by an unfeafonable act of feverity. Robert de Brienne, count of Eu and Guimes, had been taken prifoner by the king of England at Cacn ; and under pretence of negotiating his ranfom, had paffed fertral times between France and England; bur being accufed of a treatonable correfpondence with Edward, he was by order of his fovereign fuddenly arretted, cordemned, and beheaded, without any form of trial. At his death, it is faid that he confeffed his treafonable practices; but that has not been authenticated by any hiftorian of credit. Having been contable of Fratice, the fword', the badge of his office, was celivered to Charles de ld Carda: but his fate wa, equally unfortunate with that of his predecefior, being foon after aftaflinated by Charles king of Navarre, furnamed $T \%$. ITicied. This prince, Infamous celebrated for his perfonal qualiscations, but detelted conduct of for his crimes, was the fon-in-law of Iohn himlelf. He the king of had demanded the duchy of Angotileme of the king : Navarre. but as the latter had thought pioper to befow it upon Carda, he had taken the effeetual method of revenging himfelf, by afialinating his rival. John did not fail to thow a proper refentment ; but fuch was the weaknefs of his government, that the king of Navarre fet him at defiance, and would not even condelcend to the ceremony of adking pardon until John had ient him his fecond fon as an hoitage for his perional fecurity. To thefe offences the hing of Navarre added another fith more atrocious, viz. that of afpiring to the croun of France it lelf; to which he pretended a right derived from his mother, being grandfon by the female fide to Louis the Boilterous. But his more immediate demands were the countries of Champagne and Brie. To obviate all difficulties on this head, however, John Eeflowed the cuchy of Normardy on his edelf fon Charles; and commanded him to feize the eitates of the king of Navarre. On this the latter foon made his appearance at Paris; but John found limfelf obliged to appeafe his murmurs at the expence of no lefs than 100,000 crouns.

All this time the truce with England had been very ill obferved on both fides; the French had pofeffed themfelves of the vort of St Jean d'Angeli; and the Englith had urprifed the town of Guifnes. The rival houtes of Mounsfort and Bleis ftill continaed their animotities; while Edward continued to threaten war. The king of Navarre went on with his intrigues; and even the dauphin was drawn into a confederacy againf his father. John, however, being informed of their machinations, found means to defeat them effectually. The dauphin was reclaimad by pointing out to him the impropriety of his conduct, and the difadvantage which muit unavidably accrue to himfelf from the connexions which he had formed. The king of Navarre was invited, with his principal adherents, to Navarre was invited, with his principal adherents, to ${ }^{69}$

 Hopped by the apperance of the cardinal of l'eri, who attempted to be a madiat or betneen them. H w. ever, John, who made limielt fure of vichory, wa'd liflen to no other terms than the whtation of Calais; with which the Black Prince refuling to comply, the onfet was defered till the next mornine, fur which both files waited in anviems fufpenfe.

During this interval, the young prince frenctiened his polt ly new intrenchments; and placed :00 men in anoubl, with as many archers, who were commasded to attack the enemy in flank during the heat of the engrgement. Having taken thefe precamions, bee ranged his army in three divitions; the van was commanded by the earl of Warwick, the rear by the earl, of Sulthury and Suffolk, and the main body by himfelf. In like manner, the king of France arranged his forces in three divifions ; the firlt commanded by the duke of Oleans; the fecond by the daphin, attended by his younger brothers; white he himfelt led up the main body, feconded by his youngeft and favourite fon, then about $1+$ years of age. $A$, the Englilh were to be attacked only by marching up a long narrow lane, the French fuffered greatly from their archers, who were poited on each fide behind the hedges. Nor were they in a better fituation upon emerging from this danger, being met by the Black. Prince himicit, at the head of a choten body of troops, who made a furious ontet upon their forces, already in great diouras:. A dreadial overthrow enfued: thofe who were Fremid d.as yet in the lane recolled upon their own forcen: fe:ted. whle the Engith troops who had been placed in ambuth, took that opportunity to increafe the confalion, and confirm the victory. The dauphin and the duke: of Orleans were amung the firl that fled. The king of France himfelf made the utmont efforts to rutrieve by his valour what his rabnecis had forfeited; but his fingle courage was unable to thop that confiema. tion which had now become general through his amy ; and his cavalry foon flying, he found himfelf expoted to the enemy's furs. At lenuth, fesen with fatigue. and defpairing of ficcef, he thought of yiekding himfelf a prifoner; and frequently cried out, that he was ready to deliver himdelf to his coufin the prince of Wales. The honour of tahing him, however, was re-Foms ? ferved for a much more isnoble land; he was feized by t hen por Dennis de Morbec, a knight of Arrac, who had been a.r. oblised to thy his country ior murder.

In April following, the prince conduetel his rov:? prifoner throush London, atended by an infinite cin courle of pople of all rank and thations. His moserty upon this occation was very remarkable: the king of France was clad in royal apparel, and mounted on a white flecd ditlinguibed by its fize and beauty ; while the prince himfelf rode by his fide upon a mean little horte, and in wry plain attire.

This drealful defeat, which happened in the year Mirestitie 1356, almoft entircly ruined the French affairs; and firuation of the miferies which enlued from this caufe were greatly France. nugmented by internal commotion. The dauphin, who had now affumed the government, was altogether unable to gosern a turbulent and feditious people at fuch a crifis. An affembly of the flates, which be called, took the opportunity to limit the power of the pince, impeach the former minifter, and demand the

## 7

 Morcel affested to prowide for his fafety by puting unon him a blue hood, the badge of the adiertnts of Nawrec. The public dilorders were now allo augrented ly the econe of the king of Nawrie from confinement; and thongh the dauphin was ever: affured that be had adminitered a dofe of paion to him, he was obliged itill to fay him fome appearance of regad. A foheme was $e$ wen furmed by the chiefs of the iedition to change the covemment, to vell all the power in the common, and leave the king no more than an empty title; but though this was twourabiy received by the city of Pa ris, it was entirely refected by the other cities of the kingdom. The dauplin nas like ife recognized as regent by the flates gener:l, and the inhabitants of Picardy and Champagne took up arms in his caufe.In this difiatrous ilate of affairs, the mirerics of the penple were heightened by a new and uncxpected evil. The reafants, who had been all along oppreffed by the notles, were now treated in fuch a manner, that they rofe in great numbers to revense themfelves; the caftles of the nobility were raled to the sround, their wives and daughters ravihed, and themfelves put to the molt cruel torments. At latt they were obliged to arm ia their own defence. The duke of O:leans sat off $1=, 000$ of them in the neighbourhod of $\mathrm{Pa}-$ is; 12,200 were mefiacred by the king of Navarte; $9: 00$, who had laid flege to the tomn of Meaus, where the daughees and theree other lathes of the firit rark rchided, were routed and purfued with dreadful thugiter by an officer in the fersice of Edward. Amidit thefe confutions, Narcel, the feftious leader already mentioned, perilhed in a tumuli of his own raifing; and the moft virtwous and prudent people of the nation fupported the pretentions of the dauphin. His molt dangerous enemy was the king of Navarre, who had allured to his ftatidard numbers of thofe Norman and Engliih adventurers who had followed Edward into France, and there been left to feek their fortunes; where they afloriated themfelves under the name of the
dauphin was reduced almoll to the haft extre:aity, when his hopes were revived by an unexpected propofal from his rival, of peace upon equitable and moderate tcrms. Hiforians in general have afcribed this to the natural levity of the king of Navarse ; but fome have been of opinion that he acted from prudential motives, and that he juttly fuppofed it would be more eafy to deal with the dauphin who was his own kinfman, and tumbled by fo many misfortunes, than with a haughty and imperious conqueror like Edward.

On the expiration of the truce in 1350, Edward again fet hail for France, and anchored before Calais
with a fiu: cf 1120 fail, aflumed the citle of king of Franse.
France, and at, France, and atsmented his army to tos,000 men. The dauphin, figling himelf matle to withiund fo 75 great a purct, was obliged th act on the defentive; wafern of chocfing the city of Paris for his flation, and allowing Fance by the Ersith to ravage all the open coantry. ThusE:Mard. they weice allowed to penetrate through Picardy into Chinnugne; but the ciry of Khems, where Edward deligned to have been crowned king of France, batfed their umuat efforts. From Champagnc, therefore, which was already laid watte, the Englihh monarch marched into Burgundy ; pillaging Tonnere, Gailion, and Avalon. Burgundy was faved by the payment of 100,000 merks, and a like fum was paid for Ni vernoi. At laft, after a long and dettruative march, Luward arrived at the gate of Paris; bet the prudence of the dauphin and citizens of that metropolis had rendered it impregnable to the attacks of lamine as well as the affaults of an army. Thus the war went He conon till the year ${ }^{1} 360$, when the king of England wasciade a i.ncined to peace, as is faid, by a dreadful tempelt, peace. to which his army was expofed while eacamped in the field, round Chärtres. His conduct, hovever, may more reafonably be derived from other motives. Notwithftanding ail the victories he had gained, the Freach mation thowed not the lealt favour to his claim of fur. cetion; the king of Navarre was a dangerous ris ', and the caution of the douphin in avoiding an engagement deprived him of the advantages he might expect from his valour and military thith. Thus conferences for a peace were opened at Bretigny in the Chartrane; and it was at laft concluded on the following conditions, viz. That King John fhould pay for his ranfor, at different periods, three millions of crowns of gold (alonut a million and a half of our money): Edward fhould for ever renounce all claim to the kingdom of France; and thould remain pofeffed of the territories of Poictoa, Xaintonge, l'Agenois, Perigord, the Limoufin, Queacy, Rousergne, l'Angoumois, and other dilltict in that quarter, together with Calais, Guifies. Montreuil, and the county of Ponthieu on the cther fide of France. Some other fipulations were made in favour of the allies of England, as a fecurity for the esecution of thefe conditions.

Upon lohn's return to his dominions, he found himfelf very ill able to ratify thofe terms of peace that had been juft concluded. He was without finarices, at the head of an exhaufted itate ; his foldiers without difipline, and his peafants without fubordination. Thefe had rifen in great numbers ; and one of the chiefs of the banditi affumed the title of The Friend of God and the terrar of Man. A citizen of Sens, named Guin Gouge, alfo got himfelf, by means of his rotberies, to be acknowlelred kint; and he foon cauled ac many calamities by his devartations, as the real king had brought on by his misfortures. Such was the tiate of that wretclied kingdom upon the return of its captive monareh: and yet fuch was his abfurdity, that he immediately prepared for a croilade into the Holy Land, before he was well replaced oa the throne. Had his exhrutled fubjects been able to equip him for y han ana. this climerical project, it is probable he would have bleto pay gone through with it; but their miferies were fach, , furme that they were even too poor to pay his ranfom. This Engmions. was a breach of treaty that John would not fubmit to;

## $\Gamma$ R A

 maner upron the occation: "Thous h (w, he) son frith thould be batiiked from the reth of the cart, y,
 hars." la enafenance of this datatution, he ac tually returned to Eugiand once more: and jowded bimelf a pritoner, face be could wo be honourably free. It i, fud by fome, that his painon for the comtein of salabuy was the rea cune of hivarney : hat
St we want at this time the fond wion for furh an injuriDiee, and is our report. He was lodged in the S.roy, the palnce fucceeded by Chathes the Wife. where he had rended daring hi caplivis; and foon atter he clofed a long and mifurtante rim, by his deatin, which happened in the year 134 , about the 56 h year of his age.

Charles, furnamed ihe $[\mathrm{F}$, fuccecud his father on the throne of France; mal thin monarch, merdy by the furce of a finely cundueted policy, and even though duffering fome defeat, reftorat his conatry onde more to tranguillity and power. He quelied and didipated a fet of banditi, who had affociated themielve, tander the name of Companions, and who had long been a terror to the peaceable inhatitant. He had thon enrolled into a brody, and led them into the kingdum of Caftile againt reter, firmamed the crat, whom his fubjects had dethroned, and who, by menso of an alliance with the Endih, endenvoured to get himfll :e-mindated upon the throne. Ia confequence of thefe alliance, the Euglih and Freacia again come to ata engaement; their armies on the one lide commanded by the Black Prince; on the other, by Henry of Trantamarre, and Bertrand du Gueiclin, one of the mol confummate senerals and accomplined charaters of the age in with he lived. However, the whal good fortune of the Englin prince prevaiied; the French Wil above 20,000 men, while unly four knights and to private men on $s_{2}$ the fide of the Ergith were hain.
Bad fuccefs Nevertheief, thele vieluries ware attended with very of he Enz-few good effect. The Eng!!h, by their frequent 1 :tuh. vies, had been quite exhauited, and wete umable to continue an army in the field. Charles, on the other hand. cautiouty forbore coming to any decinive engesement; but was contented to let his eneniie, walte their flreagth in atempts to plunder a fortified country. When they were retired, he then was furc to fatly forth, and pofert himust of fuch places as they were nut haver enoug to defend. He hird iall upon Ponthiea; the cirizon of Auserille opened their gates to him ; thofe of St Valoi, Rue, and Crotuy, imitated the example: and the whole country was in a little time, reduces to tutal fuminion. The futhern provinces were, in the tame manner, invaded ty his shacrals with cqu.l fuccef; white the Black Prince, IU. H tute of fupplie fiom England, and walled by a coml and confumptive ditorder, was obliged to retuan to hin native country, leaving his afairs in the fouth of Fratice in a deperate comdition.

In this exigence, the refentment of the king of Eagland wasexited to the utmon pitch: and he fermed relolyed to take Fignal vengeance on his encmic. of the coatinent. But the fortunate occhion was hons elapped ; and all his fucceeding detigns were ma.hed with it laceef. The carl of Pembroke and his whele army were intercepted at fea, and tiken prifoners by Henry king of Catile. Sir Roucrt Enoulle, une vi

One, under the command of the Cake of bugurdy, entured Artwin; another cerareal Aave nice, under the command of the duke of Berry; that which acted in Guieme was comanded by the duke of Angon: and the force in Bretagne were under the comiatie Gueflin: the king himelf had a puwerful body of troops, that be might be abie to thfini any accident which flould happen through the cinnce of war. The comtahle joined the duke of Burguady, who found it dificult to oppofe Sir Thomas Felton and the funcichal of Burdeaux. Som aher his arrival, the contable attacked and defe.ted them, mahing both the commanders prifuers of war. This viclory was fo well purfued, that, at the clofe of the campaign ${ }^{1377}$, Bryome and Bourdeauy, wit! the dialrict about them, and the fortrels of Camis with its dependencies, were all the places left to I.ngland on the continent.
Thus Charle cilablified once more the houle of Va-Denti lois on the throne of Framee, but did not long live to Charle : enjoy his good fottune. He died in the year 1379, at the ase of $4+$, of the confequences of poiton formerly given him by the king of Navarre, as has already been mentioned. The immediate operation of this poilun had been fufpended by the thill of a phajician fent by the emperor Charles IV. He opened an iflue in his arm, the ruming of which precerved his bife; bet the phyfician declard, that whenever it thould diy up, the coniequence would be fatal. Not long before his death, Charles had commenced a procels asainh the king of Navarre for this crime. Several of the :lifocintes of the latter fulfered on this occafion, and the king himelf wait deprived of his poffelions in Normandy, as well as his lordalip of Montpelier, whish had been given him in licu of the countics of Champagne and Brie, and the duchy of Furgundy which $s_{4}$ be bad claimed. He did not long furvive the death of mol of the Fitench monasch whom he deftrocal. His death mis. was finguhar and very terrible; for having, been allhid. *atre ad with the leprofy, he had been obliged to make t. : of fome bandagen difyed in fulphur, and aflernand stareed in bandy. - ran e. 4 ate aing , in order to fupport his arabitious enterprites. At that time Joan, infanous for her protligacy, reigned in Naples. She had appointed one Charles Duazzo, who was her re'ation, to fucceed lee in the throne; but the inhuman wretch murdened his bunctactref, who with ber laft breath revoked lier grant of the kingdom to him, and bellowed it upon the duke of Anjou. His intiuence at the French court enabled him to wafte the treafures of the kingdom in lupport of his pretetions; though he proved ultimately uniuccefsful, his forces being confantly defeated, and his deligris frufirated by the fuperior fkill of his adverfary. The duke of Burgundy, intead of inflrueting his pupil in the ways of virtue, indulged him in every kind of vicious pleafure, hoping thereby to gain his favour afterward:. The citizens of Paris, opprefled by taxes, bruke out into tumalts, and were quelled with difficulty ; while the mal-adminitration of Philip the duke of Burgundy foon involved the nation in hoflilities with the Flemings. Philip invaded their coantry at the head of an army of 80,050 men, along with whom was the young king, accompanied by the principal nobility of France. The firt operations of war were favourable to the Flemings; but they were at length totally defeated on the banks of the river Lis, where their leader, with 25,000 of his followers, perifhed. This victory was followed by the fubmifion of the whole country; but the farivaction of the king at this event was difturbed by new feditions and revolts in the city of Paxis, and other great towns of the kingdom. His return, however, at the head of a victorious army, foon reduced them to their duty, and feveral of the revolted citics were feverely punimed; at the fame time that the death of the duke of Anjou having freed him from the immediate dependence on his tutors, he affumed the reins of government into his own hands in the year 1384.

The genius which Charles began to difplay in his early years, raifed the hopes of the nation; but thefe were foon overcatt, and gieater misfortumes than ever were now about to enfue. The young king, whole marriage began to be a fubject of attention to the council, refufed to comply with the forms in ufe among his predecefiors, and infifted upon feeing the perfon defigned for his confort. An interview was accordingly contrived betwist him and Ifabella daughter to the duke of Bavaria; where he fell in love with that princef, and afterwards married her. His admi- niftration was for fome time prudent and sigorous. He conciliated the affection of his people by reftoring their privileges, punilhing their oppreffors, and relieving them from the taxes which had been impofed in his minority. He reduced the Memings to fubmit to the authority of lis uncle the duke of Burgundy ; detached 15,050 archere and 1500 men at arms to allift the Secti in their incurfons into England; and in 1385 fitted out a prodigious armament againit England. I vall hiect wa aftembled in the harbour of bluys, and a very numerons army in the neighbourboud. According to tome writers, the armament confited of 1200 thip, 25,000 foot differently armed, 22,200 cavalry, an. $2 c, 000$ crols-bow-men. There wis befike a wal wooden edifice or floating town, rebich whe contrived for tle protection of the foldiers when landod: Eut all thefe preparations were at latt
brought to nothing through the obitiracy of the duke Faに? of Berry; who, having been originaliy againtt this meafure, carried on his part of the armament fo dowly, that he did not arrive at Sluys till the middle of September, when the featon was for advanced, that no invafion was practicable. I thorm that happened foon after, drove the greatell part of the tleet on thore, and beat the wooden cdifice all to pieces; the remains of which the king beflowed on the duke ot Burgundy, to whom he gave alio the port of Sluy, which was then very commedious, and of tine utmolt importance.

The deftruction of the Fiench fleet was only a prelude to calamities of a more entraordinary nature. The Sieur de Craon, a proligate nobleman, had been intruited by the court of France with a conliderable fum of money for the fupport of the duke of Anjou, at the time he was reduced to diticefs by his Italian expedition. This money he had dillipated at Venice; but, by the credit of the: duke of Orleans, the king's brother, he had obtained his pardon, and returned to court. Here he attempted to gratify his pivate relentment by the aflaffination of Oliver Clifon the conftable, whom he fufpected of having promoted his dif grace. This veteran hero was attacked, on his return from the hotel de St Pol, by a band of 20 ruflians, againft whom he defended himfelf with wonderful intrepidity, when at laft he fell, after recenving more than 50 wounds. Happily, however, he recovered notwithflanding his being mangled in this manner: while the afiatim, to fcreen himfelf from vengeauce, fled for protection to the duke of Britanny. The king demanded the affafin to be given up to him in chains; but the duke anfweref, that he knew nothing of him: to which the king giving no credit, marched with all his forces into his teritories. When the army arrived at Mans, the king was feized with a flow fever; but I , feized could not be prevailed upon to reft or take phytic. On with lunathe 5th of Auguf 1391, having marched all day intic fits. the heat of the lun, a miferable, ragged, wild-looking fellow darted from behind a tree, and laying hold of the bridle of his horle, cried out, "Stop! where are you going, king ? You are betrayed :" and immediately withdrew again into the wood. The king paffed on not a little difturbed; and foon after one of the pages, who rode bchind and carried his lance, orercome with heat, fell afleep, and let it fall upon the helmet which was carricd by the other. The king, hearing the noile, looked about; and perceiving the page lifting the lance, killed him immediately: then riding furioufly with his fword drawn, he ftruck on every fide of him, and at every perton, till he broke his fiword; upon which one of his gentlemen leaped un behind him and held his arm. He fell foon after, and lay as if lie had been dead; fo that being taken up and bound in a waggon, he was carried back to Mans, where he lay two days in a lethargy, after which he c:ume a little to himielf, and exprefled great concern at the blood he had fhed in his delirium. The people who had exprefied the greatell concern for his dilemper, were equally rejoiced at the news of his recove. ry; but unfortunately it was firon difcovered, that he no longer poffefled that ilrength of judgment and underitanding for which he had formerly been remarkable. Hence a regency becamc indifpenfably neceflary;

## F R A

Fonce. and the conpetition for it brought to light the chat rakers of the queen and duse of Otlean:, whith hat not hitherto been diphayed to puhlic view. The former of thefe was a moll bratiful and accompaitand princefs; but vindidive, violent. and intriguing : infemible to natural affection, hut cally acceflib'e to flatery, and ready to yield to every implle of lawluf painon. The duhe of O:leans was eru:lly remarkabte for his nerfoanl accomplithments, and had married Veleitina daugher of the duhe of Mifm: Lut his engagements with that princeis did not prevent him fron engaging in a number of licentions anous, and among the reth, as was hapofed, with his diter-in-law Iabella. During the hing's t'ine's he openly apiried at the regency; but his pratentions were overnuled by the flates, the alminiftration of aftars being for the prefent conferced on the duke of Bargundy. In a fer months indeed the heath and underflanding of the king feemed to be fufficiently reftored: but in the yenr 1393 it was again difterbed by an accident no lefs exAnace:der traordinary than the former bad bien. An entertainment occafions a had been given in honour of the marriage of one of the relapfe in the king. queen's attendant's. At this in matiques e:tered the apartmeat, difguifed like fatyrs, in limen clothes covered
with rolin, and while warm ituck over with down. Thefe were the king and five of his iords. The duchers of Berri paid attcntion to the king, though the did not know him, and engaged in converation with him. In the mean time the duke of Orieans ignorant of the confequence, out of diverfion ran a lighed torch againat one of them. His whole drofs was intantly in a tlame, and the fire was from him communicated to all the :cht. The malques, no:withlanding the dreadiul ituation they were in, called out, "Save the ling; fave the king!" on which the duchefs of Berri, recollecting that it mula be him with whom the had engaged in coverlation, wrasped him in her cloak, and preferved hia from further danger. Only one of the reft eicap11 be jumping into a cilern of water; the other four peritied in the Hancs. The terror which the king undersent by this accident inftantly occafioned a relaple; and he continued delirious at intervals as long as he lived. During this flate of infanity he was untractable by every perion except Valentina duchefs of $\mathrm{O}_{\mathrm{t}}$ leans; who feemed to have as great in intluence over thim as her hurband the duke had over the rind of the queen. So great was the power indeed which the had wer the ling in thi, deplorable flate, that in thufe fuparditious times it was fuppofed by many to the the effect of magic. Others, with more probability, afcribed it to her fuperio charms as a weman; and this isea infrantly produced her a number of encmies among her own lex, the duchefs of Burgundy particularly; and the quarrel between the tro ladies, foon extended itfelf to their hubands. Amidit their diffenfions, however, they did not eatirely neglezt the adminiftration of puolic afflairs; they ttrove to conciliate the affication of the farliament by preferving the rights of the common, inviolate; and they endeavoured to check an inordinate patlion for gaming which hegan to appear about this time, and to fubfitute manly aid martial exercifes in its place.

Daring the intervals of his reafon, Charles frequentiy affumed the government into his own hande: ard as the var till contioued with England, thagl: in

 dariag which face it was hoped that a :athen fenco might ake place. Richar! wave up (herturg to Charles, and Breft to the duke of Bhatay: : hairriage was alfo concluted betwixt the hing of i. $i$ in 1 and Ifabclla the daughter of Charle, though the late: was then only leven years of ace; bat by reston of the tender "f, e of the princels, this mariado was ne:er confummated.

During this unfortenate reion, France was fint far- $\mathrm{l}^{\text {an }}$ thet: weakencd by the fuccours fent to the Hencarions ite et the againtt the Turks. On this fatal expedition up) incour: nards of 1030 of the bravell and moft experianced limnat knights were fent under the conduct of John count of rian.
Nevers, eldent fon of the duke of Burguidy ; the count of Eu, contlable of France; John de Vime. admiral of France; and the count of Marche, a panace of the blood royal ; tugeticer with De Courcy, ons of the bell and mott experienced captains in Chrilendum. The prodent countis of this veteran, howeser, were not obeyed by the youthful warriors by whom he vas accompanied. Attacking the enemy therefure rahly, and while heated vith winc, they were all cither hil!ed or taken prifoners. Notwithlanding this difafer, however, afthance was feat in the year 1400 to Wanceflaus emperor of Germany; and the duke of Orlean, who commanded the army on this occafion, acquitted himfelf fo well that he acquited the duchy of Luxemburg for himeif, and left his ally fatisfied : but while the friendilhip of France was thus courted by forcign powers, the kingdom itfelf was in the moft miferable fituastion. The king's dittemper feemed daily to gain violcine ground ; while the difcordant interefts of the contend-commoing parties kept the whole nation in a ferment. The tions in moil violent anmotity took place betwist the dukes of $\mathrm{Pranc}^{\text {a }}$ Orleans and Burgund. The former, by mean of his own intereft with the queen, and the afendency his duchefs had over the king, for fome time got the better of his rival, and was made lieutenant seneral and governor of the kingdom; but having profumed on his power to levy new impofis on the feople, and opprefing allo the churchmen, whom in that fuperlitious age he ought by all means to have let alone, he wadeprived of his authority, and obliged to yield to the duke of Burgundy. For fome time, however, thefe powerful rivals were kept within time bounds by the mediation of the duke of Bourbon, who fecms to have been the only grandee who maintained a pure and unfpoted claracter ; but by his death in 14, the urlhappy nation was left totally expoled to their relenteifury. In $14=5$, the quecn and duke of Orle?ns again fived the adminiftration ; but were foon deprived of it by the unamimous roice of the peoplc. During this perind Charles and his childen vere aegleatel and abantoned to ditrefo; but they were relieved by the dake of Purgundy on lis ohtaining the regcacy; and Whrella, with the duke of Oneans, nas obliged to retire tiom Milan. A fudden return of the king's reafon and underflanding for a mach lunger time than ulual, now derived buth pases of ther buer: and the ad-

 puad of piane en of the bloot.The thon rival dukes, thes prohibited fiom interforing in puthic afiairs, exerifed themetres in commitumy lotalities again the Englih, with whom the ?nte had been litely concinaed. They were encouretsed to this infaction of the treaty by the uncotted ituation of the aftion Henry 15 .. bas their attempts proving unfuccelital, the trace was renerad atter obtaining rettoration of the princeis, who had been married to Richard II. as has been alrealy mentioned. The fillure of their enterprife produced a new fene of Cificond betwixt the dakes, who mata?ly threw the blame upon each uther. By the entreaties of the duke of Berry they were afparently reconciled; but the duke of Burgundy pretended fienduip orly in order to take the more fignal vengeance. To this be was now further indamed by jealonfy. Havirg hired a band of rullians to execute his bloody purpofe, the duke was one evening attecked by eighteen of them while attended only by two pages. A Norman gentleman whem the duke lad deprived of an employment, headd the allafins, and in perfon attacked the duke. At the firl blow he cut off his hand, at the fecond he truck lim from his mule, ard at the third put an end , his life. His wife Valentina was fo concerned at his death, that fhe died foon atter. The duke of Burgundy efcaped to Flanders; and the whole nation was Ent into two factions, called the Burgunalians and Armegnace; the latter being the title of the party of the duke of Orleans, from Armzonac the father-in-law of - hat prince. A dreadrul coniunon enitued: the duke of Burgundy foon returned to France, and extorted a pardon from the unhappy king, who was now no junger able to relift him: and we may have fome no: ion of the flate of the kingdom in general from being whd, that $2=00$ people perihed in one tumult in the capital. The king himfelf was alternately the prifoner of each party, and alternately transferred the power from the one to the other as he happened to fall into their hands. This therefore was thought by Henry V. of England, a favourable opportunity to recover from Prance thole grants that had been formerly given up by treaty. But previoully, to give his intended expedition the appearance of jultice, he fent over ambaliadors to Paris, offering a perpetual peace and alliance, on condition of being put in poffefion of all thole provinces which had been ravilied from the Englifh during fome former reigns, and of efpoufing Catharine, the French king's daughter, in marriage, with a fuitable dowry. Though the French court was at that time extremely averfe to war, yet the exorbitance of thefe demands could not be complied with; and Henry invafion by very probably made them in hopes of a denial. He Hensy V. therefore affembled a great fleet and army at SouthEndand ampton; and having allured all the military men of the kingdom to attend him, from the hopes of conqueft, he put to fea, and landed at Hartleur, at the head of an army of 6000 men-at-arms, and 24,000 foot, moftly archers.

His firll operations were upon Hartleur ; which being preffed hard, promifed at a certain day to furrender unlefs relieved before that time. The day arriving, and the garrifon, unmindful of their engagement, itill refolsing to defend the place, Henry ordered an
allault to be made, took the town by hurn, and put F:-
all the garmion to the fiord. Fron thence the bictor advanced fartier into the countiy, which lad been alseady rendered defolate by faction, and whion he now totally laid watte. Put although the enemy made a iceble refitance; yot the climate feemed to tight a arint the Englih; a contagious dvtentery carroires of three farts of Ifeary"s amy. In this fithutions he had recourle to an expedient common enouch in that baribarous age, to infpire his troyps with contidence is their general. He challengel the donphin, who commanded in the French amy, to ingle combat, ofiering to flake his pretentions on the event. This chatlenze, as might natually be expested, was rejected: and the French, though difagreeing internally, at lat feemed to unite at the appearance of the commen danger. A numerous army of $1+. c 00$ men at arme, and $+0,002$ font, nas by this time aliembled under the conmand of Count Albert, and was now placed to intercept Henry's weakened forces on their return. Tlee Engliih monarel, when it was too late, began to repent of his rath inroad into a comery where difafe and a powerful army everywhere threatened delifuction; be therefore thought of retiring into Calas. In this retreat, which was at once both painfel and dangerous, fienry took every precaution to infpire his troops with patience and perfeverance; and howed them in his own perfon the bightell example of fortitude and refignation. He was continually haraffed on his march by flying parties of the enemy; and whenever he attempted to pais the river Sumne, acrofs which his march lay, he law thoops on the other fide ready to oppofe his panage. However, he was fo fortunate as to feize by furprife a paffage near St Ouinti., which had not been fufficiently guarded ; and there he fafely carried over his army.

But the enemy was ifill refolved to intercept his retreat : and atter he had paffed the fmall river of Tertrois at Blangi, he was furprifed to obferve from the heights the whole French army drawn up in the plains of Agincourt ; and to poited, that it was impolible for Eattle of him to proceed on his march, without coming to an Agmeourt, engagement. A battle accordingly tock place, in which the Englifh gained a victory, the mort remarkable perhaps of any recorded in hiftory; an account of which is given under the article Agnicolrt.

This victory, gained on the 25 th of Otaber $1+15$, was however attended with no inmediate effects. Henry fill continued to retreat, after the battle of Agincourt, out of the kingdon; and carried his prifoners to Calais, and from thence to England. In 1417, he once more landed an army of 25,000 men rdy again in Normandy ; and prepared to Atrike a decifive blow in Norfor the crown of France, to which the Englih mo-maidy, natchs had long made pretenfions. That wretched country was now in a moll deplorable fituation. The whole lingdom appeared as une vait theatre of crimes, murders, injuflice, and devaftation. The duke of Orleans was allafinated by the duke of Burgundy ; and the duke of Burgundy, in his turn, fell by the treachery of the dauphin. At the fame time, the cluke's fon, defirous of revenging his father's death, entered into a fecret treaty with the Engiih, and a league was immediately concluded at Arra, letween Henry and the young duke of Burgundy, in which the king pro-

## $\mathrm{F} R \mathrm{~A} \quad[8:] \quad$ F $\mathrm{R} A$

France. mifed to revenge the murder of the late duke; and the fon feemed to infit upon no further ftipulations. Henry, therefore, proceeded in his conquelts without much oppefition from any quarter. Several towns and provinces fubmitted on his approach; the city of Rou* en ras befieged and taken: Pontoife and Gifors he foon became malter of. He even threatened Paris by the terror of his power, and obliged the court to remove to Troyes. It was at this city that the duke of Burgundy, who had taken upon him the protection of the French king, met Henry in order to ratify that treaty which was formerly begun, and by which the crown of France was to be transferced to a itranger. The imbecility into which Charles had fallen, made him pative in this remarkable treaty ; and Henry dictated the terms throughout the whole negotiation. The principal articles of this treaty were, That Henry thould efpoufe the princeis Catharine; that King Charles fhould enjoy the title and dignity of king for life ; but that Henry fhould be declared heir to the crown, and fhould be intrufted with the prefent adminiftration of the government ; that France and England fhould for ever be united under one king, but ftiould ftill retain their refpective laws and privileges; that Henry fhould unite his arms with thofe of King Charles and the duke of Burgundy, to deprefs and fubdue the dauphin and his partifans.

It was not long after this treaty, that Henry married the princels Catharine; after which he carried his father-in-law to Paris, and took a formal poffeffion of that capital. There he obtained from the eftates of the kingdom a ratification of the late compact; and then turned his arms with fuccefs againft the adherents of the dauphin; who, in the mean time, wandered about a itranger in his own patrimony, and to his enemies fucceffes only oppofed fruitlefs expoitulations.

Henry's fupplies were not provided in fuch plenty as to enable him to carry on the war without returning in perfon to prevail upon his parliament for freih fuccours; and, upon his arrival in England, though he found his fubjects highly pleafed with the fplendour of his conqueits, yet they feemed fomewhat doubtful as to the advantage of them. A treaty, which in its confequences was likely to transfer the feat of empire from England, was not much relifhed by the parliament. They therefore, upon various pretences, refufed him a fupply equal to his exigencies or his demands; but he was refolved on purfuing his fchemes; and, joining to the fupplies granted at home, the contributions levied on the conquered provinces, he was able once more to afiemble an army of 28,000 men, and with thefe he landed fafely at Calais.

In the mean time, the dauphin, a prince of great prudence and activity, omitted no opportunity of repairing his ruined fituation, and to take the advantage of Henry's abfence from France. He prevailed upon the regent of Scotland to fend him a body of 8000 men from that kingdom; and with thefe, and fome few forces of his own, he attached the duke of Clarence, who commanded the troops in Henry's abfence, and gained a complete victory.

This was the firlt action which turned the tille of fuccels againft the Engliih. But it was of hoort duration : for Henry foon after appearing with a collider-

Vol. IX. Patt I.
able army, the duphin tled at his approwh; white many of the places, which hell! out for the deuphan in the neighourhood of Paris, furrendered to the conqueror. In this manner, while 1 i-nry was everymhere vitorious, he fixed his reflatnce at Paris ; and while Charles had a linall court, he was attended with a very magnificent one. On Whitfunday r 421 , the two kings and their two queens with crowns on their heads dined together in public; Charles receiving apparent homage, but Henry commanding with abioute auth.)rity.

In the mean time, the dauphin was ciafed bevond the Loire, and almott totally difpefieded of all the northern provinces. He was even purfucd into the fouth, by the united arms of the Englifh and Burgundians, and threatened with total deitruction. In this exigence, he found it necelfary to fpin out the war, and to evade all hazardous aclions with a rival who had been long accultomed to victory. His probence was everywhere remarkable ; and, after a train of lon, perfecutions from fortune, he found her at length wiling to declare in his favour, by the death of the king of England.

Charles VI. died a fhort time after; and Charles VlI. D. fucceeded his father to a nominal throne. Nothing 14 miv .ind could be more deplorable than the fituation of that chates. monarch on affuming his title to the crown. The Englith were mafters of almoft all France; and Henry VI. though yet but an infant, was folemnly invelled with regal power by legates from Paris. The duke of Bedford was at the head of a numerous army, in the heart of the kingdom, ready to oppofe every infurrection; while the duke of Burgundy, who had entered into a firm confederacy with him, $11 i l l$ remained liedfaft, and fcconded his claims. Yet, notwithftanding thefe favourable appearances, Charles found means to break D, per the leagues formed againft him, and to bring back his henaton fubjects to their natural interetis and their duty.

However, his firlt attempts were totally deftitute of fuccefs. Wherever he endeavoured to face the cnemy he was overthrown, and he could fcarccly rely on the friends next his perion. His authority was infulted even by his own fervants; advantage after advantare was gained againft him ; and a battle fought near Verneuil, in which he was totally defeated by the duke of Bedford, fecmed to render his affairs altogether defperate. But from the impofibility of the Englith kceping the field without new fupplies, Bediord was obliged to retire into England; and in the mean time, his vigilant enemy began to recover from his late confternation. Dumois, one of his generals, at the head of 1000 men, compelled the earl of Warwick to raile the fiege of Montargis; and this advantage, llight as it was, began to make the French luppoie that the Englih were not inviacibie.

But they foon had ftill greater reafon to triumph in Thur Frenci) their change of fortune, and a new revolution was prown is red.eed by means apparently the mopt unlikely to be at- tesedty tended with fuccests. In the sillage of Domremi, near of oricens. Vaucuuleurs, on the borders of Lorrain, there fived a country girl, abnut 27 years of age, called 7 an de stre. 'T his girl had been a fervant at a fnall inn; and in that humble flation had filloutted to thofe hardy enployments which fit the body for the fatignes of wat. Slee was of as isreproablabl; life, and had hiI.

## F F A [ 82 F$] \quad \mathrm{R} A$

siarce. therto teitified none of thofe enterprifing qualities which difplayed themfelves foon after. She contentedly fulfilled the duties of her fituation, and was remarkable only for her modelty and love of religion. But the miferies of her country feemed to have been one of the greatelt objects of her compaffion and regard. Her mind, inllamed by thefe objects, and brooding with melancholy ftedfattnefs upon them, began to feel leveral impulies, which the was willing to miftake for the infpirations of heaven. Convinced of the reality of her own admonitions, the had recourfe to one Baudricourt, governor of Vaucouleurs, and informed him of her deffination by heaven to free her native country of its fierce invaders. Baudricourt treated h.er at firlt with neglect: but her importunities at length prevailed; and willing to make a trial of her pretenfions, he gave her fome attendants, who conducted her to the court, which at that time refided at Chinon.

The French court were probably fenfible of the weaknets of her pretenfions; but they were willing to make ufe of every artifice to fupport their declining fortunes. It was therefore given out, that Joan was actually infired; that the had been able to difcover the king among the number of his courtiers, although l.e had laid afide all the diftinctions of his authority; that the had told him fome fecrets, which were only known to himfelf; and that the had demanded, and ninutely defcribed, a fivord in the church of St Ca tharine de Fierbois, which the had never leen. In this manner, the minds of the vulgar being prepared for her appearance, the was armed cap-a-pee, and hown in that martial drefs to the people. She was then Lrought before the doctors of the univerfity ; and they, tinctured with the credulity of the times, or willing to lecond the impotture, declared that the had actually zeceived her commiffion from above.

When the preparations for her miflion were completely blazoned, the next aim was to fend her againft the cremy. The Englifh were at that time befieging the city of Orleans, the laft refource of Charles, and every thing promifed them a fpeedy furrender. Joan undertook to raile the fiege; and to render herfelf Itill more remarkable, girded herfelf with the miraculous fword, of which fhe before had fuch extraordinary notices. Thus equipped, the ordered all the foidiers to confefs them!elves before they fet out ; the difplayed in her hand a confecrated banner, and affured the troops of certain fuccefs. Such confidence on her fide foon raifed the fpirits of the French army; and even the Engiith, who pretended to defpife her efforts, felt liemfelves fecretly influenced with the terrors of her nifior. A fupply of provilions was to be conveyed intu the town; Joan, at the head of fome French troops, covered the embarkation, and entered Orjeans at the head of the convoy which the had fafely protected. While fhe was leading her troops along, a dead filcnce and aitonihment reigned among the Englifh; and they regarded with religious awe that temerity, which they thought nothing but fupernatural afliftance rou'd infpise. But they were foon rouftd from sheir ftate of amazement by a fally frem the town; Joan led on the befieged, bearing the faered llandard in her hand, sacouraging them with her words and actions, bringmig them to the trenches $2_{2}$ and overponering the befie-
gers in their own redoubts. In the attack of one of France. the forts, fhe was wounded in the neck with an arrow; but initaatly pulling out the weapon with her own hands, and getting the wound quickly dreffed, fhe haftened back to head the troops, and to plant her victorious banner on the ramparts of the enemy. Thefe fuccefles continuing, the Englifh found that it was impolfible to refilt troops animated by fuch fuperior energy ; and Suffolk, who conducted the attack, thinking that it might prove extremely dangerous to remain any longer in the prefence of fuch a courageous and victorious enemy, raifed the fiege, and retreated with all imaginable precaution.

From being attacked, the French now in turn became the aggreffors. Charles formed a body of 6000 men, and fent them to befiege Jergeau, whither the Englith, commanded by the earl of Suffolk, had retired, with a detachment of his army. The city was taken; Suffolk yielded himfelf a prifoner; and Joan marched into the place in triumph at the head of the army. A battle was foon after fought near Patay, where the Englith were worlted, as before; and the generals Scales and Talbot were taken prifoners.

The raifing of the fiege of Orleans was one part of the Maid's promife to the king of France ; the crowning him at Rheims was the other. She now declared that it was time to complete that ceremony; and Charles, in purfuance of her advice, fet out for Rheims at the head of 12,000 men. The towns through which he pafled opened their gates to receive him; and Rheims fent him a deputation, with its keys, upon his approach. The ceremony of his coronation was there performed with the utmoft folemnity; and the Maid of Orleans (for fo the was now called) feeing the completion of her miffion, defired leave to retire, alleging that the had now accomplifhed the end of her calling. But her fervices had been fo great, that the king could not think of parting with her; he preffed her to ftay fo carneftly, that the at length complied with his requeft.

A tide of fucceffes followed the performance of this folemnity ; Laon, Soiffons, Chateau-Thierri, Provins, and many other fortreffes in that neighbourhood, fubmitted to him on the firit fummons. On the other hand, the Englih, difcomfited and difpirited, fled on every quarter; not knowing whether to afcribe their misfortunes to the power of forcery or to a celeltial influence; but equally terrified at either. They now found themfelves deprived of the conquefts they had gained, in the fame manner as the Frencl had formerly fubmitted to their power. Their own divifions, both abroad and at home, unfitted them entirely for carrying on the war ; and the duke of Bedford, notwithttanding all his prudence, faw himfelf divefted of his ftrong holds in the country, without being able to ftop the enemy's progrefs. In order therefore, to re-Henry VI. vive the declining tate of his affairs, he refolved to of England have Henry crowned king at Paris, knowing that the ${ }_{\text {king of }}^{\text {rowned }}$ natives would be allured to obedience by the fplendour France. of the ceremony. In 1430 , Henry was accordingly crowned, all the vaffals that ftill continued under the Englifh power fwearing fealty and homage. But it was now too late for the ceremonies of a coronation to give a turn to the affairs of the Englifh; the generaLity of the kingdom had declared againft them, and the

## $\mathrm{F} R \mathrm{~A} \quad[8 . j] \quad \mathrm{R} R$ A

France remainder only waited a convenient opportunty to fol. low the exmmple.

An accident enfied foon after, which, though it promifed to promote the Englith caufe in lrance, in the end ferved to render it odious, and conduced to the total evacuation of that country. The duke of Butgundy, at the head of a powerful army, had lad fiege to Compeign; and the Maid of Orleans had thrown herfelf into the place, contrary to the wihhes of the governor, who did not defire the company of one whole authority would be greater than his own. The garrifon, however, were rejoiced at her appearance, and believed themfelves invincible under her protection. But their joy was of thort duration; for Joan having the day after her arrival headed a fally, and twice driven the enemy from their intrenchments, fhe was at laft obliged to retire, placing herfelf in the rear, to protect the retreat of her forces. But in the end, attempting to follow her troops into the city, fhe found the gates thut, and the bridge drawn up by order of the governor, who is faid to have long wifhed for an opportunity of delivering her up to the enemy.

Nothing could exceed the joy of the befiegers, in having taken a perfon who had been fo long a terror to their arms. The fervice of Te Deum was publicly cclebrated on this occafion; and it was hoped, that the capture of this extraordinary perfon would reftore the Englith to their former victories and faccefles. The duke of Bedford was no fooner informed of her being taken, than he purchafed her of the Count Vendome, who had made her his prifoner, and ordered her to be committed to clofe confinement. The credulity of both nations was at that time fo great, that nothing was too abfurd to gain belief that coincided with their paffions. As Joan but a little before, from her fucceffes, was regarded as a faint, fhe was now, upon her captivity, confidered as a forcerefs, forfaken by the demon who had granted her a fallacious and temporary affiftance. Accordingly it was refolved in council to fend her to Rouen to be tried for witcheraft: and the bithop of Beauvais, a man wholly devoted to the Englifh intereft, prefented a petition againft her for that purpofe. The univerfity of Paris was fo mean as to join in the fame requelt. Several prelates, among whom the cardinal of Wincheffer was the on!y Englimman, were appointed as her judges. They held their court at Rouen, where Henry then refided; and the Maid, clothed in her former military apparel, but loaded with irons, was produced before the tribunal. Her behaviour there no way difgraced her former gallantry ; the betrayed neither weaknefs nor womanilh fubmiffion ; but appealed to God and the pope for the truth of her former revelations. In tbe ifite, fte was found guilty of herefy and witchcraft; and fentenced to be burnt alive, the common punilhment for fuch offences.

But previous to the infliction of this dreadful fentence upon her, they were refolved to make her abjure her former errors; and at length fo far prevailed upon her, by terror and rigorous treatment, that her fpirits were entirely broken by the hardihips fhe was obliged to fuffer. Her former vifionary dreams began to varifh, and a gloomy diftruft to take place of her late infpirations. She publicly declared herfelf willing to recant, and promifed never more to give way to the
vin de: which had hitherto milled her, wat is poted on the peeple. This was whit her opprefiot. -... defired; and wifing to thow fome appearance of me: cy, they changed her fentence into pupetual mprion ment, and to be fel du-ing hife on breal mand wate: But the rage of her cremice an... st eet fintiatel. Sa fpecting that the female dref, which the bat watent ad to wear, was difigreable to leer. they prameis placed in her apartm int a fuit of mon's apparel, and watched for the effect of their temptation ugos her Their cruel artifices prevailed. Joan, struch with the fight of a drefs in which the had gained to moth glory, immediately threw off her penitent's rubes, and put on the forbidden garment. Her enenics caught: her equipped in this manner ; and her imprudence was conficered as a selaple into her former tranfigetions. Iff No recantation would fuffice, and no pardon would and crueliy be granted. She wis condemned to be burnt alive in wit to the market place of Roaen; and this infamons fentence ${ }^{\text {deats... }}$ was accordingly executed with moft brutal feverity.

One of the firlt misfortunes which the Englih felt after this punilhment, was the defection of the dukof Burgundy; who had for fome time feen the error of his conduct, and withed to break an unnatural connexion, that only ferved to involve his country in ruin. A treaty was therefore begun and concluded betweera him and Charles, in which the former agreed to alliti him in driving the Englifh out of France. This wa, a mortal blow to their caufe; and fuch was its effect. upon the populace of London when they were informed of it, that they killed feveral of the duke of Burgundy's fubjects, who happened to be among them at the time. It might perhaps alfo have hatened the duke of Bedford's death, who died at Rouen a few days after the treaty was concluded; and the earl of Cambridge was appointed his fucceffor to the regency of France.

From this period, the Engliih affairs became totally Affairs of irretrievable. The city of Paris returned once more the Engift to a fenfe of its duty. Lord Willonghbs, who commanded it for the Englih, was contented to ftipulate for the fafe retreat of his troops to Nurmandy. Thus ground was continually, though flowly, gained by the French; and notwithlfanding their fields wace laid walte, and their towns depopulated, yct tbey found protection from the weakneth and divifions of the Englih. At length both partics began to grow weary of a war, which, though carried on but feebly, was yet a burden greater than either could furport. But the terms of peace infilted upon by both were fo wide of each other, that no hopes of an accommodation could quichly be expected. A truce, thereforc, for twentytwo months, was concluded in 1443, which left every thing on the prefent footing between the parties. No fooner was this agreed upon, than Charles employed himfelf with great incluftry and judgment in repairing thofe numberlefs ills to which his kingdom, from the continuance of wars both foreign and domentic, had fo long been expofed. He eftablithed difcipline as mong his troops, and jullice among his governors. He revived agriculture, and reprefied faction. Thus being prepared once more for taking the field, he took the firt favourable occation of breaking the truce; and Normandy was at the fame time invaded by four $\mathrm{L}_{2}$ owerful

## F R A $[8+] \quad \mathrm{F} R \mathrm{~A}$

merses powerfularmies; one commanded by Cliarles himfelf, afecond by the duke of Brittany, a third by the count of Alençon, and a fourth by the Count Dunois. Every Thace opened its gates almoft as foon as the French appeared before them. Rouen was the only one that promifed to hold out a fiege; but the inhabitants clasmoured fo loud for a furrender, that the duke of Someeriet, who commanded the garrifon, was obliged to : apitalate. The battle, or rather the fkirmifh, of Fourmingi, was the laft ftand which the Englifh made 'n defence of their French dominions. However, they sere put to the rout, and above a thoufand were flain. 111 Normandy and Guienne, that had fo long acknowledged fubjection to England, were loft in the fpace of a year; and the Englih faw themfelves entirely difpolifiled of a country which for above three centuries iney had confilered as annexed to their native domi:hions. Calais slone remained of all their conquefts; and this was but a fmall compenfation for the blood and treafure which had been lavifhed in that country, and willy ferved to gratify ambition with a tranfient applaufe.
Thus, in the year 1450, the power of the Englifh in France was entirely deltroyed ; and Charles defervedly obtained the furname of Vificrivus, on account of the vigour he had fhown in driving out the invaders of
his country. His fatisfaction, however, was now greatly diminifhed by domeftic misfortunes. The dauphin, forgetting the allegiance and filial duty he owed to his father, had already impeded his conquefts by his
feditious intrigues. He had ufed every endeavour to thwart the defigns of his minifters, and it was fuppofed that he had deftroyed Agnes Soreille his father's favourite miffrefs by poifon. He had married Charlotte daughter to the duke of Savoy; which Charles had refented by a declaration of war againft the duke, but had been perfuaded to recal it in order to profecute the war againlt Guienne, which made part of the dominions of the Englifh. At laft, weary of the difobedience of his fon, he commanded him to be arrefted; but Louis, informed of his defign, withdrew to Franche Comte, and afterwards to Brabant ; of which the duke of Burgundy (at this time fovereign of the country) yas no fooner apprifed, than he ordered him to be fupplied with every neceffary, and treated with all imaginable refpect. He refufed to fee him, however, until he fhould obtain the approbation of his father; on which Louis, having in vain attempted to draw the duke into a participation of his crimes, employed himfelf in fowing difenfion betwixt his benefactor and his :on the count of Charolois, at the very time that he himfelf was receiving a penfion of $\mathbf{1 2 . 0 0 0}$ crowns annually from the father. Thus he at latt deftroyed the $\pm$ omeftic peace of his benefactor, while his unnatural behaviour created continual fufpicions in the mind of his father. Charles was repeatedly informed that his $0: 3 n$ domeftics, along with his undutiful fon, were in $a$ confpiracy againft his life. The miferable monarch, therefore, in continual fear of being poifoned, and having none in whom he could repofe any confidence, obtinately refufed fir fome days to take aay nourithment; and when at laft prevailed upon by the importunities of his attendants to do fo, his fiomach had become incapable of receiving fond, fo that he died for want of fuftenance in the year 1461 . His body, seglected by, his unnatural fon, was interred at the ex-
pence of Tannegui de Chaftel, who had been his faithful companion.

On the death of Charles, his fon Louis fucceeded to ${ }_{\text {Reign }}{ }^{1<7}$ the throne, to which he had fo long afpired. He Loum XL. was reckoned one of the greatelt politicians that ever exilted; though his character was not on that account the more amiable; on the contrary, there are few prínces whofe hiftory appears in a more deteftable light. So deftitute was he of natural affection, that he did not even attempt to conceal his joy at his father's death. He pretended much friendihip for the count of Charolois, fon to the duke of Burgundy, on account of the protection he had received at his father's court; and even conferred upon him a penfion of 12,000 crowns annually : but all this how of affection foon degenerated into a mortal averion on both fides. Some differences which took place between the courts of France and Caftile produced an interview betwixt the two monarchs, Louis, and Henry furnamed the Impotent. They met at Mauleon on the confines of Navarre: but their negotiations came to nothing, and they parted with a mutual contempt of each other; Henry defpifing the mean and fordid appearance of Louis, as he in his turn did the gaudy magnificence of Henry. In his negotiations with the duke of Burgundy, Louis proved more fucceffful ; perfuading him to reftore fome towns on the river Somme, which had been ceded by Charles VII. and by the poffeffion of which the duke was in effect mafter of Picardy. This ceffion was oppofed by the count of Charolois; but Louis, by corrupting John de Croy the duke's minifter, obtained his end; and for the fum of 400,000 crowns the cities were delivered to him. By this tranfaction he effectually enfured the hatred of Charolois : and even in that very tranfaction the duplicity of Louis was eminently difplayed; for though he had agreed to retain in thofe towns the officers appointed by the duke, he was no fooner in poffeffion of them than he difplaced them all, and nominated others in their ftead.

The duchy of Brittany was at this time governed Formidable by Francis, a weak but generous prince, and whofe confederacy defect of capacity was fupplied by the abilities of his againft minifters. Him Louis infulted in the moft grievous ${ }^{\text {Louis. }}$ manner ; and as Francis found himfelf unable to oppofe fuch a powerful adverfary alone, he joined in a clofe alliance with the duke of Burgundy and the count of Charolois; the latter having been grievoully offended with Louis, and even accufed him of attempting his life. The confpiracy was joined by feveral of the principal French nobility, who had been oppreffed by the king; and though the fecret was confided to upwards of 500 perfons, not one of them ever divulged it. Louis finding matters become very critical, marched with an army towards the capital, which the count of Cbarolois already infulted. A battle enfued, in which both princes exerted themfelves to the utmoft, though their valour was but ill feconded by the bravery of their troops. About 1500 perilhed on each fide; but the count of Charolois remained mafter of the field of battle. Louis, howcver, after this engagement, entered the capital : where he endeavoured, by every kind conceffion he could think of, to conciliate the affection of his fubjects; in which he fucceeded fo well, that though the army of infurgents

France. was foon augmented to more than rec.ejo .....a, t...y le9
cluded.
:10
Treachery of Leus. were unable to make themfelvas maters of the city. At lait a treaty was fet on foot betwint Louis and the count of Charolois; by which the latter obtained the towns which had been formerly ceded, with the diftricts of Boulogne, Guilne, Peronne, Mondidior, and Roye, as a perpetual inheritance for himfelf. By granting favours to the other confederatcs, the league was broken; and the moment that Louis found himielf freed from danger, he protented againft the whole teaty in the prefence of fome confidential members of parliament, as contrary to the interelt of the crown; and therefore waited the firf favourable opportunity to crult one by one thofe who had been ready by their united efforts to deftroy himfelf. The duke of Bourbon, one of the moit able of the confederates, was gained over, by beftowing upon him in marriage, Jane the natural daughter of Louis himfelf, with the dowry of Uion in Auvergne; together with Moras, Beaurepaire, and Cormillon in Dauphiny ; while, by the difcontents betwixt the dukes of Brittany and Normandy, he was enabled to fecure the neutrality of the former, and to recover from the latter fome territories which he had unwillingly ceded to him.

In 1467 , Philip duke of Burgundy, from his amiable qualitics furnamed $T$ The Good, died, and left his dominions to his fon Charles count of Charolois. That fiery and impetuous prince, jealous of the growing power of France, and an implacable enemy of Louis, had entered into a fecret treaty with Francis; but Louis had driven the Bretons from the poits they occupied in Normandy before the duke of Burgundy could pafs the Somme. The king, however, alarmed at the power of the confederates, concluded a peace with Brittany ; and, confiding in his talents for negotiation, determined to have a perfonal interview with the duke of Burgundy.

This memorable interview took place in the year 1468 ; and Peronne, a city of Picardy, but belong. ing to the duke of Burgundy, was appointed as the place of rendezvous. To this place the politic Louis repaired with a flender train, and attended only by Cardinal Balue, the duke of Bourbon, and the count de St Pol, conitable of France ; feemingly without reflecting that he was entering a hoitile city, where he might be confined for any length of time, or treated at the pleafure of the duke, who was his mortal enemy. Indeed he had not long been in the place when he began to fee the error of his conduct; and by the daily concourfe of Burgundian lords and other perfons of rank, who were his avowed enemies, he became alarmed for his perfonal fafety. His fear now fuggeited to him a worfe meafure than even the former; and he requefted apartments in the caftle, where it was in the power of his rival in a moment to make him a clofe prifoner. This event accordingly took place, and that through the arts and machinations of Louis himfelf. His defign had been from the beginning to keep the duke of Burgundy confantly employed in domeftic wars. For this purpofe he had, before his interview with Charles, excited the inhabitants of Liege, who were fubject to the duke of Burgundy, to revolt. It is molt probable, that he did nut imagine the effects of this treachery would fo foon begin to 3ppear. At the very time, however, that Louis way

 great numbers of the adhere its of Chark, setired with the prifoners they had mate to the capital. Charles was foon informe of ali, mallere, with the additional cir unifance, that the anbani...to:s of Louis were feen animating the infirsemt to :he is work of deftruction. He then flew into a tranipmer: of rage; commanded the gates of the catle to be thut and ftrictly guarded; denouncing the fevercit vengeance on the perfidious monarch who had fo oten deceived him. Louis, however, though greatly, and no doubt very juftly, alarmed, did not neglect to take the proper methods for lecuring himfelf. He diltributed large fums of money among thole olficers to whom he imagined the duke was molt inclined to pay any regard, and by fplendid promifes and prefents endeavoured to allay the refentment of hi other enemies. At latt the refentment of Charles having fubfided, he entered into treary a treaty with the king, and concluded it upon much betwern the fame terms as thole which had been agreed upon Chatles. before. His refentment, however, itill manifited itfelf fo far, that he infinted upon Louis being prefent at the punithment he inflicted upon the inhabitants of Liege for the maflacre they had committed, and of which we have already taken notice. This was agreed to: the two princes formed the fiege of the city in conjunction; and, notwithitanding the obftinate defence of the people, it was at lat taken by itorm, ard the inhabitants maflacred. It was not long, however, before the new alliance was diffolved. A confederacy againft Louis, whom neither promifes nor treaties could bind, was formed betwist his own brother the duke of Normandy and the duke of Burgundy ; but before their meafures were ripe for execution, Louis had already commenced hoftilitics. The duke of Burgundy, as a peer of France, was fummoned to parliament ; and on his refufal, the conitable St Pol made himfelf mafter of St Quintin. Several other cities were foon after reduced; and Baldwin, the natural brother of Charles, corrupted by Louis, deferted his caufe; and the haughty fpirit of the duke was thus at laft oblized to condefcend to folicit a peace. This, however, was of no long duration. Charles, encou, raged by the fuccefs of Edward IV. of England hi; brother-in-law, began once more to league againt Louis with the dukes of Brittany and of Giuienne; the latter being the king's brother, formerly duke of Normandy, but who had exchanged that duchy for the territory of Guienne. But while the affairs of the confederates feemed to be in a profperous way, their Frofpects were fuddenly overcat by the death of the duke of Guienne, which was univerfally fuppofed to have been occafioned by poifon, and Louis was as univerfilly looked upon as the author. The abbot of St Joan d'Angeli was fixed upon as the immediate perpetrator of the deed: but on the day appointed for his trial he was found ilrangled in his cell; and this allo was with great probability fuppoled to have been the deed of Louis, who after the death of his brother inAtantly feized on the territory of Guienne, and annex. ed it to the dominions of lirance.

By this unheard of conduct of the French monarch, Charles was exafperated to fuch a degree, that he vous. ed the molt dredid vengeance of timt the whaly f

## F R A [ 86$] \quad \mathrm{F}$ R A

 Jeat if Frw"e and theatened of fuctioce on the menory of the dunc o. Cuichue every ore who row fell int) : had. The citizens of Netle were mallutel withoui dhthetion of fes or age: Be weris refited his 1…cce. Ifang entered the country oi Cius, he : duces the citics of Ea and si Vatery, hurnt Longuewhe, and wafed the whle country as fur as Roucn. Louk, on the oher hand, fteady and confant in his acigns, deterniz: 1 to diglulve the league benwen the dahe Bittany and Edward 1T. of England. Ac. cordinly he cacamped with his amy on the frontiers of Prattiny; while the dake, not nieeting with the aniuta: ice promiled by Edward, was obliged to confent to a truce fin a yeur; and the duke of Burgundy himfeli was ,ced to fullow his exampie, having committed fuch devaltations as deprived him of all means of fublitence in the country, fo that he could neither advance nor retreat. In a very littie time, however, he again began to confpire with the king of England againft Louis, and a powerful invalion was determined upon. Edward was to crofs the fea with an army of 10,000 men, while Charles affembled all his forces to join him. The former was alfo to let up a claim to the crown of France, and at leaft to obtain the provinces of Normandy and Guienne; the euke was to have Champagne with fome adjacent diatricts; to free his dominions from homage; and neither party was to make peace without the confent of the other. It was fuppofed that the duke of Brittany would naturally accede to the confederacy; and the Count de St Pol, conftable of France, had engaged to deliver up the town of St Quintin and others which he occupied on the river Somme. Louis, however, fill had the good fortune to avoid the ftorm. Charles, initead of advancing to the affiftance of Edward, who had entered France at the head of 15,000 archers and 1500 men at arms, laid fiege to the city of Nuiz on the Rhine; while the conftable St Pol, inttead of delivering up the towns as he had promifed, deceived his allies, and emabled Louis to difiolve a confederacy, which, had it been vigoroully maintained, might have involved him in the greatelt difficulties. To procure
county: To this sudution he adhered: but no fooner Fianes. was the teme esired, than he concluded a truce with L mis for whe sears. The flipulations publicly agreed unon betwint the e two princes confilted only in tome article, for the muturl adsantage of theit fubjects : but frivately they had figned others of a different nature. The conftable St Pol having rendered himielf obnosiou: to all parties by his complicated treachery, Hed to Mons in Hainault; but the duke of Burgundy had already confented to deliver him up on condition of receiving his eftates and moveables as the price ot his treachery.

Thus was Louis without any other remarkable qualification than the mere arts of falfehood and duplicity, got rid of all his enemies excopt the duke of Burguady, whofe growing power rendered him a conitant object of jealoufy and terror. His own imprudence and raftnefs, however, foon proved his ruin. Having charles ralbly engaged in a war with the Swifs, he was de-gages in a feated in the firft engagement with that martial nation, war with with the lofs of his military chelt and baggage, with the Switso his plate and jewels, fuppofed to be the richeft in Europe. His difappointment on this occafion was fo great, that he was feized with a fevere ficknefs, from which he had hardly recovered when he refumed his mad fcheme of conquering the Swifs. Another battle enfued; in which, after an obftinate difpute, Charles was defeated with the lofs of 18,000 men, himfelf efcaping with great difficulty. This difafter was followed by the defection of molt of his allies; the duke of Lorrain recovered the city of Nancy and great part of his dominions which Charles had feized; while the latter, overwhelmed with fhame and difappointment, fpent his time in folitude and inactivity. From this he was at laft roufed by the misfortunes which fell upon him in fuch quick fucceffion. He now invelted the city of Nancy; and in this, as well as in every other inftance, he acted againft the advice of his belt officers; and the confequences were fill more fatal than before. The duke of Lorrain advanced with a ftrong body of Germans to the relief of the city, while Charles had fcarcely 4000 men to oppofe him. His troops were therefore eafily defeated, and himfelf, notwithitanding the molt heroic efforts of valour, hurried away in the crowd. The count de Campobaffo, an Italian nobleman in whom he put a great deal of confidence, but who was in reality a traitor, had deferted with about 80 men in the begianing of the engagement. He left 12 or 15 men about the duke's perfon, $H_{e}$ is affafwith ftrict orders to affalinate him in the tumult; and finated. this order they punctually complied with; the body of Charles being found two days after the battle pierced with three wounds.

The news of Charles's death was received with the moft unfeigned joy by Louis, whofe fole object now was to unite the territories of the duke of Burgundy to his own. This might be done in two ways; one to his own. This might be done in two ways; one Conqueit of
by a match betwist the dauphin and Mary the herrefs Burgundy, of Burgundy; the other, by marying her to the duke by Louis. of Angouleme, a prince of the royal blood of France, and on whom Mary had thown fone inclination to beftow herfelf. The king, however, to whom duplicity and falfehood feem to have been abfolutely necelfary, chofe a third method, more agrecable to his character. The match with the danphin was attended with fuch

France. circumataces as rendered it evidently impracticable. The difparity of age was very great, the dauphin being only eight years old, and the princefs twenty : the Flemings were befides very much averfe from fubmitting to a prince whofe powerful relources would enable him to opprel's their liberties: but notwithitanding thefe unfurmountable difficulties, Louis chofe to infilt upon the match, at the fame time that he endeavoured to make himfelf malter of her dominions by force of arms. He addreffed circular letters to the principal cities of Burgundy; reprefenting, that the duchy had been given by King John to the male heirs of his fon Philip; and that now, when thefe were extinct by the death of Charles, the territory reverted of courfe to the crown. 'To render this argument more effectual, he corrupted the governors of fome towns, feduced the inhabitants of others to rife againit their governors ; whilit he himfelf at the head of an army, prepared to enforce obedience from thofe who could not be worked upon by other methods. Thus the province of Burgundy was entirely reduced ; but Flanders could not be brought under fubjection either by fair means, force, or fraud. In his conduct for this purpofe, indeed, Louis difplayed the moft deteitable as well as the meaneft treachery and fallehood. To render Maty odious to her fubjects, he negociated with her minifters, and prevailed upon them to difclofe to him fome of the moil important ftate fecrets; after which he communicated their letters to the flates of Flanders. This double treachery, however, did not at prefent anfwer his purpofe. The two miniters whom he had betrayed were indeed put to death without mercy, and that even in the prefence of their fovereign: but Mary herfelf was thus induced to beflow herfelf upon the emperor Maximilian ; and Louis had the mortification to find that all his arts had contributed only to aggrandize a rival power, whom he had already fufficient caufe to dread. To remedy this overlight, he entered into an alliance with Edward IV. of England, whom he had infpired with a jealoufy of his brother Clarence, in order to prevent a match betwist that nobleman and the princefs Mary, which had alo been in agitation. Thus a peace was concluded between the tiwo monarchs, to continue during the life of each, and a year after.

The marriage of Mary with Maximilian effectually fecured the independence of Flanders; while the return of the prince of Orange to the party of that princefs extended the flames of war once more to the cities of Burgundy. The Frencls were on the point of being totally expelled from that country, when Maximilian unexpectedly made propofals of peace. A truce was on this concluded between the two princes, but without any term limited for its duration, or without any conditions fipulated in favour of the Burgundians; fo that the whole country was quickly after secuced by Louis.

The king now frced from the apprehenfions of foEysanny nd crue iLouis.
againt him in the league in which Edward and Charkes Fr.. were concerned. The unfortunate nobleman, knowing that vengeance was determined againit him, fled to a fortrels named Carlat, fituated among the mountains of Auvergne. Here he was befieged by the Scigneur de Beaujen, who had marricd Anne the daughter of Louis. The place, however, was ahnott impregnable to any force; fo that his enemies were obliged to make the mott folemn promifes of fafety in order to induce him to furrender himfelf. By thefe he was at laft perfuaded to truft himfelf in the hands of the faithlefs tyrant; who no fooner had him in his power than he thut him up in the Battile in an iron cage, and reprimanded the judges becaufe they had releafed him from this clofe confinement during the time of his examination. The judges reluetantly condemnet him to be bcheaded : but the king's cruelty extended beyond the fentence; and he ordered the two young fons of the duke, though yet in early childhood, to be placed directly under the fcaffold, that they might be coverel with the blood of their father. Four thoufand perfous are fuppofed to have perifhed upon this occafion without any form or trial: and were it not for the concurrent teftimony of the hiftorians of that age, the inhumanities and barbarities of this monarch are farce to be credited. By thefe he broke the fpirits of the French nobility, and gradually extended the power of the crown beyond all bounds; fo that at laft it was l mited only by the fovereign's pleafure. Amidf all the perfidy and cruelty, however, for which this monarch is fo juftly to be detefted, we may on fome occafions remark a kind of magnanimity and generolity, which we cannot but applad. An inftance of this was his fupporting the houfe of Medici againft Pope Sextus, whom he obliged to defilt from his attacks, and to recal his fentence which he had fulminated againt them.

In 1479, the emperor Maximilian, who had lightly Eargurd abandoned the duchy of Burgundy when he might untu cetshave reduced it, now renewed his claims when it was aded by no longet in his power to enforce them. After a va Maxim: riety of actions of leffer note, and the deltruction of lian. cities on both fides, a decifive battle was fought at Guinegate. Here the Flemings were routed ; but a: the French purfued with too great ardour, the intantry of the enemy rallied, and the battle was renewed with great flaughter on both fides. A more decilive advantage was afterwards gained by the capture of 80 Fle. mith veflels, which induced that commercial people to think of peace. In the mean time, however, Loui:, after a life fpent in contimual deceit, hypocrify, and cruelty, received waming of his approaching end by a fit of apoplexy with which he was feized in the year 1480 . He lay fpecchlefs and motionlefs for two days; after which he recovered in fome degree, 1 ut never completely regained his health and itrength. llis illnefs, however, neither prevented him from purfuing the fchemes of his ambition, nor from uing the fame methods as before to attain them. He feized, without any pretence, the ellates of the duke of Bourbon, the only nobleman in the hingdom whofe poner could give lim any caule of fufpicion; yet, notwithftanding his adiduity for the interelt of the dauphin, he kept him a hind of prifoner in the caftle of An : Luife, fermitting none but his own fervants, or per-

## F R A [ 88 ] F R A

Grite fons of the meaneit rank, to have accefs to him. He banilhed his own confort, the mother of the dauphin, to Savoy, and endeavoured to infpire the prince with averfion towards her. By the death of Charles, the tiwlar hing of Naples, and the laft of the fecond houfe of A jou, he became maller of the county of Provence; but lis fatisfaction on this occafion was marred by a fecond ilroke of apoplexy. Stiil, however, lee revived, and, with his recovery, again began to purfue his ambitious intrigues. The death of Mary of Burgundy, who perifted by a fall from her horfe, intpired him with new views; and he betrothed his fon to the infant dauchter of the emperor. Thus he offended Edward IV. of England, whole eldeft daughter Elizabeth had been previoully contracted to the dauphin; and a war would have undoubtedly enfued, had it not been for the death of the king of England.

122
Reign of This was followed in no long time after by that of Louis himfelf, who had in vain exhaufted the ikill of the phyfician, and wearied the clerical order with prayers and proceffions to avert the impending ftroke. He expired in the year 1483 , after a reign of 23 years; during which he was detefled by his fubjects, whom lie had continually oppreffed ; and equally dreaded and hated by his neighbours, whom he had conftantly deceived: notwithttanding which he obtained the title of $110 /$ Chrifian from his holinefs, which his fucceffors have ever after retained.

Notwithftanding the dark character of this prince, it is undoubtedly to be allowed, that he laid the foundations of the future greatnefs of France. By his arts he deprived the common people of their liberty, depreffed the power of the nobility, eftablifhed a ftanding army, and even induced the ftates to render many taxes perpetual, which formerly were only temporary, in order to fupport the army which was to keep themfelves in flavery. From this time the people were accuftomed to fubmit entirely to the voice of their fovereign as their only legiflator; and being always obedient in matters of the greateft confequence, they cheerfully contributed whatever fums were required to fulfl the king's pleafure.

Charles VIIl. who fucceeded bis father Louis XI. in 1483 , was only 14 years of age at the time of his father's death : but though he might, even at that age, have afcended the throne without any material violation of the laws of France, yet it was judged neceflary to have a regent, on account of the king's delicacy of conatitution and want of education. Three competitors appeared as candidates for this important trult, viz. John duke of Bourbon, a prince of the blood, and who had, till the age of 60 , maintained the moft unblemifhed character; Louis duke of Orleans, frefumptive heir to the crown, but who from his being only 20 years old himfelf, feemed incapacitated on that account from undertaking fuch an important office: the third competitor was Anne, the I2: elde:t daughter of Louis, to whom the latter had in Regency of the laft muments of his life conmmitted the charge of the L. dy $t^{2}$ = kingdom, with the title of governeís. The claim Yaneses of this lady was fupported by the affembly of the fiates pereral at Tours; and though me was only eneved into the 22d year of her age, it appears that the The could not have been more properly beftowed. B6it g married :o Peter of Bourbon, fire of Beaujcu,
her prefent title was the Lady of Beaujeu; but the $=\mathrm{p}-$ pears to have acted entirely independent of her hutband, who was but of a moderate capacity, and indeed had been recommended to her by Louis on account of his flender abilities, left by any other match the houfe of Bourbon hould be too much aggrandized. Her firt ftep was to ingratiate heafelf with the people, by fome popular acts; among which one was to punifh the inftruments of her father's crueltics. One of thefe, named Olivier le Dian, who, from the ftation of a barber, had raifed limfelf to the confidence and favour of the king, and had diftinguifhed himfelf by the invention of new modes of torture, was publicly hanged. Another, named Jean Doyac, who by continual acts of violence and rapacity had oppreffed the people, was condemned, after being whipped in all the open places or fquares of Paris, to have one of his ears cut off, and his tongue pierced with a hot iron; after which he was conveyed to his native city of Montferrand, where he was again whipped, and his other ear cut off; after which his eftates, as well as thofe of Olivier, were confifcated. Jacques Coitier, the phyfician of Louis, who had availed himfelf of the terror of death with which the king was ftrongly influenced, to extort great fums of money from him, was ordered to anfiver for the immenfe wealth he had acquired; but he averted the danger by paying a fine of 50,000 crowns.

Thus the lady de Beaujeu gained the aflection of the people at large; and was equally fuccefsful in gaining over thofe who were averfe to her government. The duke of Bourbon was made conftable, an office which he had long defired; but the duke of Orleans behaved in fuch a manner as to exclude all hopes of favour. Incenfed at the determination of a trifling difpute at tennis againft him, by the lady Beaujeu, he exclaimed, that whoever had decided it in that manner " was a liar if a man, or a ftrumpet if a woman." After this furious declaration he fled to the caftle of Beaujency, where, however, he was foon forced to furrender. He then applied to Henry VII. of England, whe had newly afcended the throne of England; but that prince, naturally flow and cautious, did not pay much attention to his propofals; on which he next made his application to the court of Brittany. Here he was received with great marks of elteem, and began to entertain Duke of hopes of marrying the daughter of the duke; but be-flies to Briting looked upon with a jealous eye by the nobility, tany. they entered into fecret negotiations with Anne, and even folicited her to invade the country. In thefe negotiations, however, they ftipulated that only a certain number of troops thould enter the province, and that no fortified place hould remain in the hands of the French; which conditions were indeed agreed to by the regent, though the determined to keep them no longer than it anfivered her purpofe. In purfuance of That coun. this refolution, Brittany was invaded at once by four try inarmies, each of them fuperior to the ftipulated number, vaded by who quickly made themfelves mafters of the moft im the Freach portant places in the country; while the troops of the duke retired in difgult, leaving them to purfue their conquefts as they pleafed. Finding at lant, however, that the entire fubjection of their country was determined upon, the nobility began to exert themiclucsin defence of it ; and, intlamed by the enthufafm of Wer-

Fraz the they afol a army of $60,000 \mathrm{mas}$. By there the Frencl! were compolicd to abandon the fiege of Nantz; tut this praved only a tranficat glam of fuccef. Aune perlevered in her defign of completing the conquett of the conntiy, and the itate of Furope at that time favoured the cetign. Of all the European llates, England alonc was then capable of aftording any effectual alintance; and the llow caution of Henrs precented him from giving the atiflance which fur his own intereft hee ought to have coric. Thus the Bretons were I, $f_{t}$ to defeend themitles the beft way they could; and having ventured a battle, they were entirely defeated, and richit of theif leaders thkei prifoners. A fimall body of Enclinh, under the command of Lord Woodville, who alifited them, were entirely cut in piecers. Tho duke foom after died by a fall from his horfe, leaving 1as dominions to his daughter Ame, at that time only 13 vears of age. A marriage wis negretiated betwist this princefs and Maximilian king of the Romans, who had been married to Mary of Burgundy; but by reafon of the poverty of that prince it was never completed. The lady Beaujen, then, finding that the abfolute conqueit of Brittany would ftill be a difficult matter, de:ermined to conclude a marriage betwist the young king of France and the duchefs, though the former had already been married to Margaret of Auftria, the daughter of Maximilian. This marriage indeed had not been confummated by reafon of the tender age of the princefs; but fhe had been fent to Paris for her education, and had for feveral years been treated as quecn of France. In I491, however, Margaret was fent back to her father: Arne of Britany for a long time refufed to violate the engagements into which the had entered; but at lat, finding herfelf diftrefled on all fides, and incapable of refifting the numerous forces of France with which the was prefled, the reluctantly confented to the match, and the nuptids were celebrated the fame year at Langeais in Touraine.

Maximilian, whofe poverty had prevented him from giving any affitance to his bride, or even from coming to fee her, earaged at the double difgrace he had fuffered, began, when too late, to think of revenge. France was now threatened with an invafion from the united forces of Auftria, Spain, and England. But this formidable confederacy was foon diffipated. Henry, whofe natural avarice had prevented him from giving the neceffary affittance, was bought off with money: the immediate payment of $745,2>0$ crowns, and the promife of 25,030 annually ever after, perfuaded him to retire into his own country. Ferdinand king of Spain had the counties of Rouffillon and Cerdagne reftored to him; while Maximilian was gratified by the ceffion of part of Artois, which hat been ac1:7 quired by Louis XI.

The young king of France agreed to thrfe terms the more readily, that he was inpatient to undertake an expedition into Italy, in order to conquer the hingdom of Naples, to which he claimed a right. Nolt of his counfellors were againf the expedition; but the king was inflexible, even though Ferdinand king of Naples offered to do homage for his kingdom, and pay him a tribute of 50,000 crowns a-year. He appointed Peter duke of Bourbon regent in his ablfence; after which he fet out on his expedition with very tew Vol. IX. Part I.
trouls and very linte moncy, liy the way he fe! ill

 the whole country in is wechs, wi won , mand of the kib, fom of Noples in luth than a ernat it S.ch extraotmary good fortune fomed mireme e, at he Wha rechoned an intrument ritid ap by (a.it thenty the eaccable tyrants with whilh Itsy was ot that time infoled. Had Charles made ate ot tisprate in his favour, and acted up to the cla acter geter liy siten him, he might have raited hio nome as hif a ary wero of antizuity. His belaviour, hovever." $w$ ant it very different nature. He amuled himelt with imts and hlows; and leaving his power in the hands of tavourite, they abandoned it to whocver would purchaic tithe, phace, o tauthority, at the rates they impoled: and th: whole force he propoled to lewe in his new cospuesed dominions anounted to no more than +000 reen.

But while Charles was thus loting his time, aleague was concluded againit him at Venice; it e which entered the pope, the emperor Masimilian, the archdute Philip, Ludovic Sforza, and the Ventiall. The confederates affembled an army of 40,020 men, command ed by Francis marquis of Mantua; and they waited for the king in the valley of Famora, in the duchy of Parma, into which be defcended with 9200 neen. (O2 the 6th of July 1495 he attacked the allies; and, notvithitanding their great fuperiority, defented ihem, with the lof of only 80 of his own men. Thus he got fafe to France; but his Italian dominions were lott ahoolt as foon as he departed. Some fichemes wee propofed for recovering thefe conquelt; ; but they were lios teat never put in execution, and the hing died of an aroplexy in 149 .

The premature death of this monarch, in the 25 th year of his age, was fuppofed to have been owing to his irregular life, and particularly his attachment to women; which had for fome time impaired his health, atd brought on evident fymptoms of his approaching diffolution. At laft he relinquilhed his irregularities, and retired with the queen to the callle of A mbloife. Here in pafing through a low door he ffruch his hesed with violence againit the top. No unfavorrable fymptom appeared at the time; but foon aiterwards, as he converfed with his confeflor, and avowed his defign of olferving the nuptial fidelity he owed to the queen, he fuddenly fell backward in a fit of apoplety. Ife recovered his woice three times, and uttered fome enpreflions of devotion; but intantly relipfed, and in a thort time expired, notwithtanding every ahlilance that could be given. He was greatly celebrated for his fiveet temper and agrecable difpoition, which procured him the furnames of the Affab/e and Courcesus. Two of bis domedtics are faid to have died of grief after his death, and his widow abandoned helfelf to the moll pungent forrow for two dayr.

By the death of Charle, VIII. the throne of France palfed from the direct line of the houle of Valois, and Loui, duke of Orleans fucceeded to the thrme. It the time of his acceltion he was in his 3 Gth year, and bad long been taught prudence in the fohol of adverity. Duling the adminitration of the lady Beaujew, be had been, as we have atready onferved, conthatly in difgrace; and after his conmesions with the II dake

duke of Britanny, had fent a very confiderebie time in prifon; and though afterwards let at literty by Charles, he had never poffefled any thare of that monarch', confidence or favour. Towards the conclufion of that reign, he fell under the difpleafure of the queen; and had afterwards continued at his caftle of Blois till he was called from thence to the pofteflion of the hingdom. He had been married in early life, and againlt his will, to Jane the youngelt daughter of Louis XI. a princefs of an amiable difpofition, but deformed in her perfon, and fuppofed to be incapable of bearing children. Afterwards he entertained thoughts of having this marriage diffolved, and was fuppofed to pofefs the affection of the duchefs of Britanny, before the became queen of France. After the death of her hufband, that princefs retired to Brittany, where the pretended to affume an independent fovereignty; but Louis having got his marriage "ith Jane difolved by Pope Alexander VI. quickly after made propofals to the queen-dowager, which on her part were accepted without heftation; though it was ftipulated, that if ine thould have two fons, the younger fhould inberit the duchy of Brittany.

As Louis, while duke of Orleans, had fome pretenfions to the kingdom of Naples, he inftantly fct about realizing them by conquelt. On his acceffion, he found matters in that country much more favourable to his defigns than formerly. The pope, Alexander VI. was very much in his interefts, from the hopes of getting his fon Cafar Borgia provided for: he had concillated thie friendfhip of the Venctians by promiling them a part of the Milanefe; be concluded a truce with the archduke Philip; and renewed his alliances
with the crowns of England, Scotland, and Denmark. and being affilted by the Venetians, quickly conquered one part of the duchy, while they conquered the other, the duke himfelf being obliged to fly with his family to Infpruck. He then attacked Ferdinand of Spain with three armies at once, two to act by land, and one by lea; but none of thefe performing any thing remarkabie, be was obliged to evacuate the kingdom of Na ples in 1504 .

In 1506 , the people of Genoa revolted; drove out the nobility; chofe eight tribunes; and declared Paul Nuova, a filk dyer, their duke : after which they expelled the French governor, and reduced a great part it the Riviera. This occafoned Lonis's return into italy ; where, in 1507, he obliged the Genoefe to firrender at difcretion: and, in 1508 , entered into the league of Cambray, with the other princes who at that time wanted to reduce the overgrown power of the Venctians. Pope Julius II. who had been the firft contiver of this league, very foon repented of it; and declared, that if the Venetians would reltore the cities of Caenza and Rimini, which had been unjuftly taken from him, he would be contented. This was refuled; and in $1, j 09$, the forces of the republic received fuch an entire defeat from Louis, that they agreed to reftore not only the two cities demanded by Pope Julius, bút whatever elfe the allies required.

The pope now, inflead of cxecuting his treaties with his allies, made war on the king of France without the leaft provocation. Louis called an affembly of his clergy; where it was determined, that in fongs sufes it
was lawfui to make war upon the pope; upon which Farce. the king declared war againt bim, and comnitted the care of his atmy to the Marmal de Trivulce. He foon obiged the pope to retire into Ravema; and in 1511 , Gatton de Foix, duke of Nemours, gained a great victory at Ravenna, but was himfelf killed in the engagement. After his death the army was dibbanded for want of pay; and the French affairs in Italy, and every where elfe, fell into great confufion. They recovered the duchy of Milan, and loft it again in a few weeks. Henry VIII. of England invaded France, and took Terruenne and Tournay; and the Swifs invaded Burguady with an army of 25,000 men. In this defferate fituation of aftairs the queen died, and Louis put an end to the oppofition of his moft dangerous enemies by negotiating marriages. To Ferdinand of Spain he offered his fecond daughter for either of his grandfons, Charles or Ferdinand ; and to renounce, in favour of that marriage, lis cldims on Milan and Genoa. This propofal His marwas accepted; and Louis himfelf married the princefs riage with Alary, fiftcr to Henry VIIl. of England. This mar- Mary of riage he did not long furvive, but died on the 2 d of Ja-England, nuary 1514 ; and was fucceeded by Francis I. count of and death. Angoulefme, and duke of Bretagne and Valois.

The new king was no fooner leated on the throne, Francis I. than he refolved on an expedition into Italy. In this invades he was at firt fuccefsful, defeating the Swifs at Marig- ${ }^{\text {I aly. }}$ non, and reducing the duchy of Milan. In 1518 , the emperor Maximilian dying, Francis was very ambitious of being his fucceffor, and thereby reftoring to France fuch a plendid title, which had been folong loft. But Maximilian, before his death, had exerted himfelf fo much in favour of Charles V. of Spain, that Francis found it impoffible to fucceed; and from that time an irreconcilable hatred took place between the two monarchs. In 1521, this ill will produced a war ; which, however, might perhaps have been terminated, if Francis could have been prevailed upon to reltore the town of Fontarabia, which had been taken by his admiral Bonivet: but this being refufed, hoftilities were renewed with greater vigour than ever; nor were they concluded till France was brought to the very brink of deftruction. The war was continued with various fuccefs till the year 1524 ; when Francis having invaded Italy, and laid fiege to Pavia, he was utterly de-Defeated feated before that city, and taken prifoner on the $2 q^{\text {th }}$ and taken
prifoner. of February.

This difafter threw the whole kingdom into the utmoit confufion. The Flemilh troops made continual inroads ; many thoufand boors affembled in Alface, in order to make an invafion from that quarter; Henry VIII. had aftembled a great army, and threatened the kingdom on that fide allo; and a party was formed in the kingdom, in order to difpoffefs the duchefs of the regency, and confer it upon the duke de Vcndofme. This prince, however, who, after the conitable, was the head of the houfe of Bourbon, went on purpofe to Lyons, where he aflured the regent that he had no view but for her fervice, and that of his country; upon which fhe formed a council of the ableft men of the kingdom, and of this the made him prefident. The famous Andrew Doria failed with the Frencl galleys to take on board the remains of the French troops under the duke of Alva, whom he land. ef fafely in France. Thofe who efcaped out of the

Milanefe

France. Milanefe alio made their way back anain as well as they could. Heny VllI. muder the intmence of Curdinal Wolley, reli,ved not to oppref the opprefled: he therefore affured the regent that the had nothing to fear from lim; and at the lame time adviled her not to confent to any trcaty by which France was to be ditinembered. Tothe imperor, howewer, he uled another language. He told him, that the time was now come when this puifint monarchy lay at their mercy; and therefore, that fo favourable an opportunity ilould not be let lip: that, for his part, he ihould be content with Normandy, Guienne, and Gafony, and hoped the empire would make no fcruple of owning him king of France: adding, that he expected the emperor would make a right ufe of his victory, by entering Guienne in perfon; in which cafe he was ready to bear half the expences of the war. He forelaw what fell out: the emperor was alarmed at thefe conditions, and did not care to have him for a neighbour ; for which reafon he agreed to a truce with the regent for fix month. In Picardy the Flemings were repulled; and the count de Guife, with the duke of Lorrain, had the good fortune, with a handful of troops, to defeat and cut to pieces the German peafants.

In the mean time, Francis was detained in captivity in Italy: but being wearied of his confinement in that country, and the princes of ltaly beginning to cabal for his deliverance, he was carried to Madrid; where, on the $14^{t h}$ of January 1525 , he figned a treaty, the principal articles of which were, That he ihould tefign to the emperor the duchy of Burgundy in full fovereignty ; that he thould defilt from the homage which the emperor owed him for Artois and Flanders; that he thould renounce all claim to Naples, Milan, Aili, Tournay, Lilie, and Hefden, \&c.; that he fhould perfuade Henry d'Albert to refign the kingdom of Navarre to the emperor, or at lealt thould give him no affiftance; that within 40 days he thould reitore the duke of Bourbon and all his party to their ellates; that he thould pay the king of England 500,000 crowns which the emperor owed him; that when the emperor went to Italy to receive the Imperial crown, he fhould lend him 12 galleys, four large hips, and a land army, or inflead of it 200,000 crowns.

All thefe articles the king of France promifed on the word and honour of a prince to execute; or, in cale of non-performance to return prifoner into Spain. But, notwithftanding thefe profelfions, Francis had already protefted before certain notaries and witneffes in whom he could trut, that the treaty he was about to fign was againft his will, and therefore null and void. On the 2 tit of February, the emperor thought fit to releafe him from his prifon, in which he had been clofely confined ever fince his arrival in Spain; and after receiving the ftrongelt anfurances from his own mouth, that he would literally fulfil the terms of the treaty, fent him under a flrong guard to the frontir r , where he was evchanged for his two eldelt fons, who were to remain as hoftages for his fidelity.

When the king returned to his dominions, his firt care was to get himfelf abfolved by the pope from the oaths he had taken; after which he entered into a league with the pontiff, the Venetias, the dube of Milan, and the ling of England, for preferving the prace (f I:aly. I: the month wi Junc, he publicly
recei: I veronflaty ir on the ftetes of B :rgundy, It which they thd him, vithose aremon, that boy.-... teeat: of Madrid he hat don whe: i.e hitin) $\begin{gathered}\text { M. }\end{gathered}$ do, in breach of the law and his commatmoneth, "... ing, that if le perfiftel in his:cilution of them:i.: then under a foreiz? yoke, they nat yed on the general dates of the kingdum. At timf remantances the viceroy of Naplo and the Spathin minits were prefent. Ihey perecived the end which the Gony aimed at, and therefore exportulated with him in prett: warm terms. At laft the viceroy told him, that fo had now nothing left but to keep his royal word in returning to the calle of Madrid, as his predeceftor I han had done in a like catc. To this the king replied, that King John acted right'y; that he returned to a king who had treated him like a king; but that at Madrid he had received fuch ufage as would have been unbecoming to a gentleman : that he had often declared to the emperor ${ }^{\circ}$. mini.2ers, that the terms they extorted from him were unjult and impracticable: but that he was ftill wiling to do all that was fit and reafonable ; and to ranfom his fons at the rate of two millions of gold, in bien of the duchy of Burgundy.

Hitherto the treaty for the tranquillity of Italy had been kept fecret, in hopes that fome mitigation of the treaty of Madrid would have been obtained; but now it was judged expedient to publith it, though the viceroy of Naples and th= Spanih lords were itill at the French count; and the emperor was to be admitted into it, provided he aecepted the king's offer of two millions for the releafe of his children, and left the duke of Milan and other Italian princes in quiet poffettion of their dominions. It is the common misfortune of all leagues, that the powers who enter into them keep only their own particular interefts in view, and thus defeat the general iatention of the confederacy. This was the cale here. The king's great point was to obtain his children unon the terms he had pronofed; and he was defirous of hnowing what hopes there were of that, before he acted againtt the monarch who had them in his power. Thus the duke of Milan and the pope were both lacrificed. The former was obliged to furrender to the duke of Bourbon, and the laticr was furprifed by the Colonnas; both of which difallers would have been prevented if the Freach fuccours had entered Italy in time. See Iraly.

According to an agreement which had been made between Francis and IHenry, their ambaffadors went into Spain, attended each of them by a herald, in order to fummon the emperor to aecept the terms which had been offered him ; or, in cafe of refutal, to declare war. It feems the emperor's anfwer was forefeen in the court of France; and therefore the king had previoully called together an affembly of the notables; that i-, perfons of the feveral ranks of his people in whon he could confde. To them he propofed the great queltion, Whether he was bound to perform the treaty of Madrid' or, Whether if he did not perform it, he was obliged in honour to return to Spain' 'To both thefe quellions, the affembly anfivered in the negative: they faid, that Burgundy was united to the crown of Pratice, and that be could not feparate it by li, own authority; that his perfon alfo was the proP.rty of the , of which therefore he could not ditivife; but for the two milhons, which they looked

## F R $A \quad[92] \quad \mathrm{F} \quad \mathrm{R}$ A

4.1 a jutt equivalent, they undertook that it thould e raited for his fervice. When the atmb, Hadors aleBivered their fropolitions, Charles treated the Englih herald wih refpeet, and the French one with contenpe; which produced a challenge from Francis to the emperor *. All differences, however, were at latt actjuted ; and a treaty was concluded at Cambray, on the gth of Augult 1528. By this treaty, immead of the foflelion, the emperor contented hinatelf with referving his richt to the duchy of Burgundy, and the two millions of cromm already mentioned. Of thele le was to receive $1,205,000$ in ready money: the yrince's land in Fhanders belonging to the houfe of Bourbon were to be delivered up; thefe were valued at 400,052 more: and the remaining 400,050 were to be paid by France in difcharge of the emperor's dibt to England. Francis was likewife to difcharge the penalty of 502,000 crowns which the emperor had incurred, by not marrying his niece the princefs Rary of England ; and to releale a rich feur-de-lis which had been many years before pawned by the houle of Burgundy for 50,000 crowns. The town and calle of Hellen were allo yielded: together with the fovereignty of Flanders and Aituis, and all the king's pretuation. in Italy. As fur the allies of France, they were abandoach to the emperor's mercy, without the leaf llipulation in their favour; and Francis himfelf protelk 1 agamit the valicity of the treaty before he ratifed it, as did alfo his attomey-general before he regifered it in parliament; but both of them with the sreatelt fecrecy imagimable.

Nothing farther of much confequence happened during the remainder of the reign of Francis I. The war was foon renewed with Charles, who made an invafion into France, but with rery bad fuccels; nor was peace
${ }^{3} 36$ fully eltablinied but by the death of Francis, which Fran i-dies happened on the 3d of March, 1547. He was fucand iv fuc- ceeded by his fon Henry II. who afcended the throne creital ly H:ry II. that very day on which he was 29 years of age. In the beginning of his reign, an infurrection happened in Guienne, owing to the opprelfive conduct of the oficers who levied the falt tax. The king defpatched againt the infurgents two bodies of troops; one commanded by the duke of Aumale fon to the duke of Guife, the other by the conitable. The firt behaved with the greatelt moderation, and brought back the people to their duty without making many examples: the other behaved with the utmolt haughtinefs and creelty; and though the king afterwards remitted many of his puniluments, yet from that time the conttable Uecame odious to the people, while the family of Guife were highly refpected.

In $154^{8}$, the hing hegan to execute the edicts which f. . We, the bad been made arainft the Proteftants with the ut!. te: ant moft feverity; and, thinking even the clergy too mild in the profecution of herefy, ereAted for that purpofe as chamice compofed of members of the parliament of Paris. At the queen's coronation, which happened this var, he caufed a number of Proteltants to be burned, and was himfe'f prefent at the fpeetacle. He was, however, fo much thoched, thet he could never forget it; tut complained, as long as he lived, that, at certain tume, it appeared before lis eyes, and troubled his underftanding

In 1549. a peace being concluded with Fngland, the

King purchafed Boulogne from the latter, for the fum of $+00,000$ crowns; one half to be paid on the day of rellitution, and the other a few months after. Scotland was included in the treaty, and the Englimp reltored fome places they had taken there. This was with Engthe moft advantageous peace that France had hitherto tand. made with England; the vaft arrears which were due to that crown being in effect remitted; and the penfion which looked fo like tribute, not being mentioned, was in fact extinguilhed. The earl of Warwick himfelf, who had concluded the peace, was fo fentible of the dilgrace fuffered by this nation on this occafion, that he pretended to be fick, in order to avoid fetting his hand to fuch a fcandalous bargain.

This year, an ediet was made to reftrain the extravagant remittances which the clergy had been in ufe of making to the court of Rome, and for correcting fome other abufes committed by the papal notaries. With this ediat Pope Julius III. was highly difpleafed; and the following year (1550) war was declared by the king of France againit the pope and the emperor. The pretence was, that Henry protected Octavio Farnefe duke of Parma, whom the pope was defirous of depriving of his dominions. In this war the king was threatened with the cenfures of the church, more efpecially when it was known that he had entered into an alliance with the Turks, and a Turkihh fleet entered the Mediterranean, where they threatened the ifle of Gozo, and made defcents upon Sicily. Henry, however, ftrongly denied any fuch connexion, and infitted that the emperor had given them fulficient provocatinn: but be that as it will, the ermperor foon found himfelf in fuch danger from thefe new enemies, that he could not fupport the pope as he intended, who on Henry's that account was obliged to fue for peace. After fuccelis this the king continued the war againft the emperor againf the with fuccess; reducing the cities of Toul, Verdun, emperor. and Metz. He then entered the country of Alface, and reduced all the fortreffes between Hagenau and Wiffenburg. He failed, however, in his attempt on Strafburg; and was foon after obliged by the German princes and the Swifs to defift from farther conquefts on that fide. This war continued with very little interruption, and as little fuccefs on the part of the French, till the year 1557, when a peace was concluded, and foon after, the king was killed at a 140 tournament by one Count de Montgomery, who was at a tournareckoned one of the ftrongeft knights in France, and ment. who had done all he could to avoid this encounter with the king.

The reign of his fucceflor Francis II. was remarkable only for the perfecution of the Prorifants; which became fo gricvous, that they were obliged to take up arms in their own defence. This occafioned feveral civil wars, the firft of which commenced in the reign of Charles IX. who fucceeded to the throne in 1560 . This $C$. 41 firit war continued till the year 1562, when a peace with the was concluded, by which the Proteitants wore to have Proictiants. a free pardon and liberty of confcience. In 1.565, the war broke out anew, and was continued with very little interruption till 1569 , when peace was again concluded upon very advantageous terms for the Proteflants. After this King Charles, who had now taken the government into his hands careffed the Proteflants in an extrandinary manaer. He invited to

court the adairal Coligni, who was the hend of the Proteltant party ; and cajoled him fo, that he was latled into a perfect fecurity, notwithtanding the many warnings given him by his fitond, that the king's filir fpeeches were by no means to be trulied; but be had foon reafon to repent his contibence. On the 220 of Auguit 157 I , as he was walking from the court to his lodgings, he received a the from a window, which carried away the fecond finger of his right hand, and wounded hin grievoufly in the left arm. This he himelf aicribed to the malice of the duke of Guile, the head of the Catholic party. After dimer, however, the king went to pay him a vifit, and amonglt others made him this compliment: "You have received the wound, but it is I who fuffer;" defiring at the farme time that he would order his friends to quarter about his houle, and promiling to hinder the Catholics irom eatering that quarier after it was dark. 'This fatisfed the admaral of the king', fincerity; and hindered him from complying with the denires of his friends, who would have carried him away, and who were itrong enough to have forced a pallige out of Paris if thcy had aitempred it.

## readitil

 mafticre the Pite. Eants.In the evening, the queen mother, C thatime $d e$ Medicis, held a cabinet council to fix the execution of the maffacre of the Proteltarts, which had been long meditated. The petions of whic! this council was
compofed, were, Henry dake or Anjou, the king's bro. ther; Gonzagua duke of Nurers; Henzy of Angoulefme grand prior of France, and butari brother of the king; and marthal de 'lavannes; and Aloert de Gondi, count de Retz: the dizection of the whole was given to the duke of Guife, to whom the adminiltration had been entirely confidel during the former reign. The guards were appointed to be in arms, and the city officers were to dilpole the militi. to execute the king's orders, of which the flunal was the ringing of a bell near the Louvre. Some lay, that when the hour approached, which was that of mid night, the king grew undetermined: that be expreffed his horror at thedding fo much blood, efpecially confidering that the people whom he was going to deItroy were his fubjects, who had come to the capital at his command, and in confidence of his word; and particularly the admiral, whom he had detained fo lately by his careffes. The queen mother, however, reproached him with his cowardice, and reprefented to him the great danger he was in from the Protellants; which at laft induced him to conient. According to others, however, the king himlelf urged on the maffacre; and when it was propofed to him to take off only a few of the heads, he cried out, " It any are, to die, let there not be one left to reproach me with breach of faith.

Asfoon as the fignal was given, a body of Swifs troops of the Catholic religion, headed by the duke of Guife, the chevalier d'Angoulefme, accompanied by many perfons of quality, attacked the admirab's houfe. Having forced open the doors, the foremoft of the affaffins ruffed into his apartment; and one of them afked if he was Coligni? 'To this he anfwered that be was; adding, "Young man refpect thefe gray hair "" to which the affaffin replied by running him through the body with a fword. The duke of Guife and the chevalier growing impatient below itairs, cried out to

 at the windus. IV, on a it fil! un the groded, the chevalier, or ( $\therefore$ f fum 1:s) the duke of (ina, wiphing the bluod off ites face, hehed is with his sont. 'The body was then alandosed to the fury of the popratace; who, atter a ierice of indignities, dresrged it whe the common gallows, to which they chane if ly the twat, the head being cut off and corried to the gheen nowtice ; who, it is faid, caufed it to be corbalmed and lent to Rome. The king limidif went t, fee the Lody han. upon the gibbet; where a lire being lindled vialer i: part was burnt, and the refl icorcinet. In the Louvre, the gentlemen belonging to the hing of Navare and the priace of Conde were murdered under the king. cye. Two of them, wawded and purfied by the at faffins, nled into the bedchamber of the queen of Navarre, and jurnped upron her bed, befecching her to tave - Acir liven ; and as ine nent to adk ihis favour of the queen mother, two mone, under the lWe ciscumitance, ruthed into the romm, and there throniches it her feet. The guten moti.er catae to the windue we enjoy thele dreadiul Icenes; and the kins, tecin, the Prutethat, who donged on the other file u: tae river figing for their live, catied for his jons gun, and hicel unon them. In the foace of tinee or four duys, maty thoular: were Leftroyed in the city of Paris, by the moft crued deaths which mellice it?elt could invont. Peter Rams, protertur of philotophy and nathematic, iter bata robbed of all he had, his oethy being firt ripued . . . , was thrown out of a window. Thiv io mace aine: Denis Immin, the king prutefin. that, thong: . zealous Catholic, be died uf terns. '1he hatk swe .i.g the King denied it was dune by his e:der:, and thre:s the whole blame on the huaf of Guite: but, on the 28 th of Auguti, he went to the faliament, awowed it, Was complimented $u_{p}$ on it, and cetieted a procels againft the adniral, by which he was ligmatizel is a traitor. Two inmoent gentimen tuEered an his accomplices in a prctended plot againa the lite of the king, in order to fet the crumn on the head of the prince of Conde. They were esecuied by torch light; and the hing and the queen mother (with the king of Navarre and the prince of Conde by tores) wete feectators of this horrid fact; and they alto affited at the jubitee to thank God for the exccution of fuch an infantous defign.

The mallacre was not confined to the city of Paris alone. On the eve of St Bartholomew, orders had been fent to the governors of proviaces to fall upon the Proteftants themfelves, and to let loofe the people upon them ; and though an edict was publilled before the end of the week, anuring them of the king's protection, and that he by no means defligned to caterminate them becaule of their religion, yet private orders were fent, of a mature dire elly contray ; in confequence of which, the meflacere, of ( 41 , in allalinn to the Sici-
 were repeated in Mrax, Orleans, lroyes, Auger, Tholluvie, Roaen, and Lyon; to that in the pate of two monthe 30,050 Pretednats were hutchench. The next year Ruchelle, the only throng tortrefs which the Protelfant, heid in France, was befiesed, lut was not taken without the lofs of 24,200 of the Catholice who telieged it. Alter this a padine ation enfued on terms

favarute to the Protenauts, but to which they never trules.

Thi, year the duke of Anjou was eleated hing of Polaid, and foun after fet out to take pofiefion of hi, new hingdom. The king accompanied bim to the frontiers of the kingdon; but during the journey was feized with a low fever, wlich from the beginning had a.e.y dangerous appearance. He lingered for tone time undes the moft terrible agonies both of body and mind ; and at latt died on the 3 oth of May 1572 , havmif lived 24 years, and reigned 13 . It is inid, that after the dreadful maflacre above mentioned, this prince liad a ferceneff in his looks, and a colour in his cheeks, which he never had tefore. He flept little, and never found. He waked frequently in agonies, and had loft manic to compofe him again to teel.
Duriag the firft years of the reign of Henry III. who fucceeded his brother Charles, the war with the Protettants was carried on with indifferent fuccefs on the part of the Catholics. In 1575, a peace was concluded, called by way of eminence the Ediat of Pacifcation. It conifited of no fewer than 63 articles; the fubfance of which was, that liberty of confcience, and the public exercife of religion, were granted to the reformed, without any other refriction than that they thould not preach within two leagues of Paris or any other part where the court was; party chamlers were crected in every parliament, to conifif of equal numbers of Catholics and Proteflants, before whom all judgments were to be tried: The judgments againft the admiral, and, in general, all who had fallen in the war or been executed, were reverfed; and eight cautionary towns were given to the Proteflants.
The edict gave occafion to the Guifes to form an affociation in defence, as was pretended, of the $\mathrm{C}_{\mathrm{a}}$ tholic religion, afterwards known by the name of the Catholic League. In this league, though the king was mentioned with refpect, he could not help feeing that it fruck at the very root of his authority: for, as the Proteftants had already their chiefs, fo the Catholics were, for the future, to depend entiriely upon the chief of the league; and were, by the very words of it, to execute whatever he commanded, for the good of the caufe, againgt any, without exception of perfons. The king, to avoid the bad effects of this, by the advice of bis council declared himfelf head of the league ; and of confequence recommenced the war againit the Proteftants, which was not extinguiihed as long as he lived.

The faction of the duke of Guife, in the mcan time, took a refolution of fupporting Charles cardinal of Bourbon, a weak old man, as prefumptive heir of the crown. In 1584 they entered into a league with Spain, and took up arms againtt the king; and though peace was concluded the fame year, yet in 1587 they again proceeded to fuch extremities, that the king was forced to fly from Paris. Another reconciliation was foon after effected; but it is generally believed that the king from this time refolved on the deftruction
of Guife. Accordingly, finding that this nobleman fill behaved towards him with his ufual infolence, the king caufed him to be flabbed, as he was coming into his prefence, by his guards, on the 23d of December 158\%. The king himielf did not long furvive him ; being ftabbed by one James Clement, a Ja-
cobine monk, on the firit of Auguft 1583. This round at firlt was not thought mortal; but his frequent fwom?. ing quickly diicovered his danger; and he died next moming, in the $39^{\text {th }}$ year of his age, and $16 t h$ of his reign.

Before the king"s death, he :mominated Henry Bourbon king of Navarre for his fuccofior on the throne of France ; but as he was a Proteliant, or at leaft one who greatly favoured their caule, he was at firft owned by very few except thole of the Proteitant party. He met with the mof vialent oppofition from the members of the Catholic league; and was often reduced to fuch ftraits, that he went to people's houfes under colour of vifits, when in reality he had not a dinner in his own. By his activity and perfeverance, however, he was at laft acknowledged throughout the whole kingdom, to which his abjuration of the Proteftant religion contributed not a little. As the king of Spain had laid claim to the crown of France, Henry no fooner found himlelf in a fair way of being firmly feated on the throne, than he formally declared war againit that kingdom; in wlich he at laft proved fuccefsful, and in 1597 entered upon the quiet poffeffion of his kingdom.

The king's firft care was to put an end to the religious difputes which had fo long diftracted the kingdom. For this purpofe, he granted the famous edict, dated at Nantz, April 13. 1598 . It re-efta-m ${ }^{149}$ blifhed, in a moft folid and effectual manner, all the Ndict of favours that had ever been granted to the reformed by other princes; adding fome which had not been thought of before, particularly the allowing them a free admifion to all employments of truft, profit, and honour ; the eftablifhing chambers in which the members of the two religions were equal; and the permitting their children to be educated without conftraint in any of the univerfities. Soon after, he concluded peace with Spain upon very advantageous terms. This gave him an opportunity of reftoring order and juttice throughout his dominions; of repairing all the ravages occafioned by the civil war; and abolifhing all thofe innovations which had been made, either to the prejudice of the prerogatives of the crown or the welfare of the people. His fchemes 149 of reformation, indeed, he intended to have carried be-propofes yond the boundaries of France. If we may believe new-model the duke of Sully, he had in view no lefs a defign than the Eurothe new-modelling of all Europe. He imagined that pean the European powers might be formed into a kind of Chrillian republic, by rendering them as nearly as poffible of equal ftrength; and that this republic might be maintained in perpetual peace, by bringing all their differences to be decided before a fenate of wife, difinterefted, and able judges: and then he thought it would be no difficult matter to overturn the Ottoman empire. The number of thefe powers was to be 15 ; viz. the Papacy ; the empire of Germany ; France; Spain; Hungary; Great Britain; Bohemia; Lombardy; Poland; Sweden; Denmark; the republic of Venice; the States General ; the Swifs Cantons; and the Italian commonwealth, which was to comprehend the flates of Florence, Genoa, Lucca, Modena, Parma, Mantua, and Monaco. In order to render the dlates equal, the empire : as to be given to the duke of $\mathrm{Ba}-$ varia; the kingdom of Naples to the pope; that of

## F R A <br> 95 J F R A

France.

Sicily to the Venetians; Milan to the duke of Savoy, who, by his acquifitio::, wa to become king of Lombardy; the Aultrian Low Countrics were to be added to the Dutch republic; Franche Compte, Aliace, and the country of Trent, were to be given to the Swifs. With a view, it is now thought, of executing this grand project, but under pretence of reducing the exorbitant power of the houfe of Aulria, Henry made immenfe preparations both by lea and land; but if he really had fuch a defign, he was prevented by death from attempting to execute it. He was ftabbed in his coach by one Ravilliac, on the 12 th of May 1608.

On the death of Henry IV. tl.e queen mother affumed the regency. Ravilliac was executed, after fuffering horrid tontures. It is faid that he made a confeffion, which was fo written by the perfon who took it down, that not one word of it could ever be read, and thus his initigatore and accomplices could never be difcovered. The regency, during the minority of Louis XIII. was only remarkable for cabals and intrigues of the courtiers. In 1617, the king affumed the government himfelf, banihhed the queen mother to Blois, caufed her favourite Marfhal d'Ancre to be killed, and chote for his minifter the famous Cardinal Richelieu. In 1620, a new war broke out between the Catholics and Proteftants, which was carried on with the greateft fury on both fides; and we may judge of the fpirit which actuated both parties by what happened at Negrepliffe, a town in Quercy. This place was befieged by the king's troops, and it was refolved to make an example of the inhabitants. The latter, however, abfolutely refufed to furrender upon any terms. They defended themfelves, therefore, molt defperately ; and the city being at lalt taken by ftorm, they were all maflacred, without refpect of rank, fex, or age, except ten men. When thefe were brought into the king's prefence, he told them they did not deferve mercy : they anfwered, that they would not receive it; that the only favour they afked, was to be hanged on trees in their own gardens; which was granted, and the place reduced to athes. Both parties foon became weary of fuch a deftructive war; and a peace was concluded in 1621 , by which the edict of Nantz was confirmed. This treaty, however, was of no Iong duration. A new war broke out which latted till the year 1628, when the edict of Nantz was again confirmed; only the Proteitants were deprived of all their cautionary towns, and confequently of the power of defending themfelves in time to come. This put an end to the civil wars on account of religion in France. Hiftorians fay, that in thefe wars above a million of men loft their lives, that $150,002,000$ livres were fpent in carrying them on ; and that 9 cities, 400 villages, 2000 churches, 2000 monafteries, and 10,000 houfes, were burnt or otherwife deftroyed during their continuance. The next year, the king was attacked vith a flow fever which nothing could allay, an eitreme dcpreftion of fpirits, and prodigious fiselling in his ftomach and belly. The year after, howcver, he recovered, to the great difappointment of his mother, who had been in hopes of regaining licr power. She was arreited; but found means to efcape into Flanders, where fhe remained during the rett of his rcign. Richeleu, by a malterly train of politics, thow h himfelf was nest to an cithufiatt for popery, fupported the

Proteflants of Germany and Gatlavas Adulphus agatalt the houle of Autria; and after quelling ali the tebellions and conlpiracies which had been furmed againlt him in France, he died fome months before Louis XIII. in 1643 .

Louis XIV. furnamed le Grand, fucceeded to the Lus ${ }^{152}$ is throne when he was only five years of age. During his minority, the kingdom was torn in pieces under the adminitration of his mother Aune of Aultria, by the factions of the great, and the divifions between the court and parliament, for the molt trifling caules and upon the moll defpicable principles. The prince of Condé tlamed like a blazing Itar; fometimes a patriot, fometimes a courtier, and fometimes a rebel. He was oppofed by the celebrated Turenne, who from a Proteftant had turned Papift. The nation of France was involved at once in civil and domeltic wars; but the queen mother having made choice of Cardinal Mazarine for her firlt minilter, he found means to turn the arms even of Cromwell againit the Spaniards, and to divide the domettic enemies of the court fo effectually among themfelves, that when Louis affumed the reins of government into his own hands, he found himfelf the moft abfolute monarch that had ever fat upon the throne of France. He had the good fortune, on the death of Mazarine, to put the domeitic adminitration of his affairs into the hands of Colbert, Who formed new fyftems for the glory, commerce, and manufactures of France, all which he carried to a furprifing height. The king himfelf ignorant and vain, was blind to every patriotic duty of a king, promoting the interefls of his fubjects only that they might the better anfwer the purpofes of his greatnefs; and by his ambition he embroiled himfelf with a! his neighbours, and wantonly rendered Germany a difmal fecne of devallation. By his impolitic and unjuft revocation of the edict of Nantz in the year $168^{\circ}$, with the dragooning * the Proteftants that followed it, he * See Drs obliged them to take fhelter in England, Holland, and gonning. different parts of Germany, where they eilablithed the filk manutactories, to the great prejudice of their own country. He was to blinded by flattery, that he arrogated to himfelf the divine honours paid to the Pa gan emperors of Rome. He made and broke treaties for his conveniency : and in the end he raifed againlt himelf a confederacy of almolt all the other princes of Europe; at the head of which was King William 111. of England. He was fo well ferved, that he made head for fome years againtt this alliance; and France fecmed to have attained the lighett pitch of military gloty, under the conduct of thofe renowned generals Condé and Turenne. (See Usited Provinces.) At length, having provoked the Englih by his repeated infidelities, their arms under the duke of I mlborough, and thofe of the Aulians under Prince Eugene, rendered the latter part of Louis's life as miterable as the beginning of it $r$ as fplendid. His reign, from the year $17=2$ to 1711 , was one continued feries of defeats and calamities; and he had the mortification of fecing thofe places taken from him, which, in the former part of his reign, were acquired at the expence of many thoufand lives. ( iee Britun, $\mathrm{N}^{0} 3 \nmid 2$, ※̌.) Juft as he was reduced, old as he was, to the tefperate refolution of collecting his people and dying at theis head, ho was fared by the Englinh Tory minitry de

## FRAB [ F F ] F'R A

Tratice. festing the caufe, withdrawing from their allies, and concluding the peace of Utrecht in 1713 . See EriTain, $\mathrm{N}^{\circ} 37 \mathrm{f}$, \&ic.

The laft years of Louis XIV. were alfo embittered by donteltic calamities; which, added to thule he had already endured of a public nature, impreficd him with a deep melancholy. He had been for fome time afflicted with a fill.la; which, though fuccefsfully cut, ever afterwards affected his healh. The year before the feace, his only fon, the duke of lurgundy, died, tonether with the duchels and their eldent fon; and the only remaining child was left at the point of death. The hing hinfelf furvived till the month of September 1715 ; but on the 14 th of that month expired, leasing the kingdom to his great grandfon Louis, then a minor.

By the latt will of Louis he had devolved the regency during the minority of the young king, upon a council, at the head of which was the duke of Orleans. That nobleman, however, difgufted with a difjofition which gave him only a calting vote, appealed to the parliament of Paris, who fet afide the will of the late king and declared him fole regent. His firft acts were extremely popular, and gave the moft favourable ideas of his government and character. He reftored to the parliament the right which had been taken from them of remonflrating againft the edicts of the crown, and compelled thofe who had enriched themfelves during the calamities of the former reign to reftore their wealth. He alfo took every method to efface the calamities occafioned by the unfuccefsful wars in which his predecefior had engaged ; promoted commerce and agriculture; and, by a clofe alliance with Great Britain and the United Provinces, feemed to lay the foundation of a lafting tranquillity. This happy profpect, however, was foon overcaft by the intrigues of Alberoni the Spanifh minitter, who had formed a defign of recovering Sardinia from the emperor, Sicily from the duke of Savoy, and of eftablifhing the Pretender on the throne of Britain. To accomplifh thefe purpofes, he negotiated with the Ottoman Porte, Peter the Great of Rullia, and Charles XII. of Sweden; the Turks intending to refume the war againit the emperor ; the two latter to invade Great Britain. Eut is long as the duke of Orleans retained the adminit?ration of France, be found it impolfible to bring his fclemes to bear. To remove him, therefore, he fomented divifions in the kingdom. An infurrection took place in iPrittany; and Alberoni fent fmall parties into the country in difguife, in order to fupport the infurgents, and even laid plots to feize the regent himfelf. All of a fudden, however, the Spanith minifler found himfelf difappointed in every one of his fchemes. His partizans in France were put to death; the king of Sweden was killed at Frederickthail in Normay; the Czar, intent on making new regulations, could not be perfuaded to make war upon Britain; and the Turks refufed to engage in a war with the emperor, from whom they had lately fuffered io much. The cardinal, neverthelefs, continued tii intifues; which quickly produced a war betwixt Spain an the one part, and France and Britain on the other. The Spariards, unable to refilt the union of two fuch formidable provels, were fon reduced to the aeceflity of fuing for reace; and the toms were dic-
tated by the regent of France; and of thele the difmitlion of Alberoni the Spanifh minitter was one. A double mariage was now fet on foot: the duke of Orleans gave his own daughter, Mademoifelle Montpentier, to Don Lew is prince of Afturias, while the infanta of Spain was betrothed to her coufin the king of France. From this time the houfe of Bourbon continued united; both pinces Leing convinced, that it was their intereft not to wate thei: ftrergth in wars againit each other.

The $f_{p}$ irit of conquef baving now in a great meafure Defluctive fubfided, and that of commerce taken place through- project of out the world in general, France became the fecne of JounLaw. as remarkable a project in the commercial way as ever was known in any country. One John Law, a Scotfman, who had been obliged to leave his own country, laid the plan of a company which might by its notes pay off the debt of the nation, and reimburfe itfelf by the profits. Law had wandered through various parts of Europe, and had fucceflively endeavoured to engrofs the attention of various courts. The propofal was made to Victor Amadeus king of Sicily ; but he difmiffed Law with a reply, that "he was not rich enough to ruin himfelf:" but in France it was looked upon in a more favourable light ; the nation being at this time involved in a debt of 200 millions, and the regent, as well as the people in general, very fond of embarking in new fchemes. The bank, thus eftablifhed, proceeded at firft with fome degree of caution; but having by degrees extended their credit to more than 8o times their real tlock, they fuon became unable to anfwer the demands made upon them; fo that the company was diffolved the very fame year in which it had been inftituted. The confufion into which the kingdom was thrown by this fatal fcheme, required the utmoft exertions of the regent to put a ftop to it; and fcarcely was this accomplifhed when $1_{5} 6$ the king, in ${ }_{1723}$, took the government into his own takes the hands. The duke then became minifter; but did not governlong enjoy this poit. His irregularities had broken mentinto his conititution, and brought on a number of ma- his own ladies, under which he in a floort time funk, and was fucceeded in his adminiflration by the duke of Bourbon Condé. The king, as we have already remarked, had been married, when very young, to the infanta of Spain, theugh by reafon of his tender years the marriage had never been completed. The princefs, however, had been brought to Paris, and for fome time trated as queen of France; but as Louis grew up, it was eafy to fee that he had contracted an The infanta inveterate batred againft the intencled partner of hisor pain bed. The minifter, therefore, at lat confented that fent back. the princefs hoould be fent back; an affront fo much refented by the queen her mother, that it had almolt produced a war betwist the two nations.

The diffolution of the marriage of louis was the laft act of Conde's adminillration; and the procuring of a new match was the firf at of his fucceffor Cardinal Fleury. The princess pitched upon was the daughter of Stanillaus Lefcrinki, king of Poland, who had been depofed by Charles XII. of Sweden. $x 5^{8}$ The prince?s was deftitute of perfonal charms, but of wath the an amiable difpofition; and though i: is probable that daughter of flec never poffeffed the love of her lanband, her excel-Stanimus lent qualities could not but extort his efteem; and the king oi Poo

France. birth of a paince foon after their marriage removed all the fears of the people concerning the fuccellion.

Cardinal Fleury continued the pacific fomes purfued by his predeccflors; though they were foncwhat interrupted by the war which took place in the year 1733. Notwithitanding the comexion betwist that monarch and the French nation, however, Fleury was lo parfimonious in his affiffance, that omly 1500 foldiers were lent to relieve Dantzic, where Staniflaus himelf refided, and who at that time was befieged by the Rullians. This pitiful reinforcement was foon overwhelmed by a multitude of Rullians; and Staniflaus was at laft obliged to renounce all thoughts of the crown of Poland, though he was permitted to retain the title of king: and that this title might not be merely nominal, the king of France confented to beitow upon him the duchies of Bar and Lorrain; fo that, after the death of Stanillaus, thefe territorics were indiffolubly united to the dominions of France. Fleury fteadily purfued his pacific plans, and the dif putes between Spain and England in 1737 very little affected the peace of France; and it muit be remembered to his praife, that intead of fomenting the quarrels betwixt the neighbouring potentates, he laboured incefliantly to keep them at peace. He reconciled the Genoefe and Corficans, who were at war; and his mediation was accepted by the Ottoman Porte; who at that time carried on a fucceffful war with the emperor of Germany, but made peace with him at the interceffion of the cardinal. All his endeavours to preferve the general peace, however, proved at latk ineffectual. The death of the emperor Charles VI. in 1540 , the laft prince of the houfe of Aultria, fet all Europe in a flame. The emperor's eldett daughter, Maria Therefa, claimed the Auftrian fucceffion, which comprehended the kingdoms of Hungary and Pohemia, the duchy of Silefia, Auftrian Suabia, Upper and Lower Aultria, Stiria, Carinthia, Carniola; the four forelt towns; Burgaw ; Brifgaw ; the Low Comntries; Friuli ; 'lyrol; the duchy of Milan; and the duchies of Parma and Placentia. Among the many competitors who pretended a right to mare, or wholly to inherit, thefe extenfive dominions, the king of France was one. But as he wifhed not to awaken the jealoufy of the European princes by preferring directly his own pretenfions, he chofe rather to fupport thofe of Frederick III. who laid claim to the duchy of Silefia. This brought on the war of $1-42$; and of which an account is given under the articles Brifins and Prussia. It was terminated in $17+^{8}$ by the treaty of Aix-la-Chapelle; but to this Louis, who fecretly meditated a fevere vengeance againt Britain, only confented, that he might have time to recruit his fleet and put himfelf fomewhat more upon an equality with this formidable powcr. But while he meditated great exploits of this kind, the internal tranquillity of the 159 hingdom was difturbed by violent difputes betwist the Dijpures clergy and partiaments of France. In the reign of betwist the Louis XIV. there had been violent contell, beiwint parliamen's the Janfenifts and Jefuits concerning free will and other and clerge, obfcure points of theology; and the opimons of the lanfenils had been declared heretical by the celebrated papal bull named C'nigenitur; the reerption of which was enforcel by the king, in oppolition to the parliamont, the arrhbithon of Pari, sad the ? of the Foz 1.K. Pot I.

people. The archichop, with 1 jothar :c...tce, an Frame tented againl it as an infringemem of the rights of the Gullicai church, of the lass of the realm, ad an in. fult on the rights of the people themfelves. The duke of Orteans favourd the bull by inducing thee binho. to fabmit to it; but at the fance time itupped a perbecution which was going on againd it opfoncas. Tha. matters paffed over till the conclufion of the peace ; : fhort time after which, the jealouly of the clergy awakened by an attempt of the miniter oi thate to in. quire into the wealth of individuals of their urder. In prevent thin, they revived the conteh abour the bull Unigenitus; and it was refolved, that confeflional nove, thould be obtained of dying perfons; that thefe now, fhould be figned by prieths who maintained the authurity of the buil; and that, withuut fuch notes, now perfon could obtain a viaticum, or extreme unclion. On this occafion the new archbithop of Pari, and the parliament of that city, took oppofite fides; the latter imprifoning fuch of the clargy as refufed to adminititer the facraments excepting in the circumitances above mentioned. Other parliaments followed the example of that of Paris; and a war was intantly kindled betwist the civil and ecclefiallical departments of the ftate. In this difpute the king interfered, forbade the parliaments to take cognizance of ceclefiatical proceedings, and commanded them to fulpend all profecutions relative to the refufal of the facraments: but inflead of acquiefcing, the parliaments prefented new remoniftances, refufed to attend any other bufnef, and refolved that they could not obey this injunction without violating their duty as well as their oath. They cited the billop of Orleans before their tribunal ; and ordered all writings, in which its jurifdiction was dif puted, to be burnt by the executioner. By the alf fiftance of the military, they enforced the adminiferation of the lacraments to the lick, and ceafed to diftribute that jultice to the fubject for which they had 100 been originally intlituted. The king, enraged at their $P$ artameri oblifinacy, arretted and imprifoned four of the mem- DiParis bers who had been moft obfinate, and banilhed the manithes. remainder to Bourges, Poictiers, and Auvergne ; while, to prevent any impediment from tahing place in the adminilitration of jullice by their abfence, he iffued letters patent, by which a royal chamber for the profecution of civil and criminal fuits was inltituted. The comfellors refufed to plead before thefe new court ; and the king, finding at leat that the whole nation was about to fall into a dlate of anarchy, thought proper to recal the parliament. The banihed members enteved Paris amidf the acclamations of the inhabitant,; and the archbihop, who flill continued to encourage the priefts in refuring the facraments, was banithed to his feat at Conlans; the bithops of Otleans and Troyes were in like manaer banihed, and a calm for the prefent relfored to the kingdom.

The trancuillity thas eltahlinhed was of no long du No. I ration. In the year $175^{6}$, the parliaments again fell pute beunder the difpleafure of their king by their imprudent wise the perfecution of thofe who athered to the bult Unige king and nitus. Tliey procected fo far in this oppolition as to refufe to regiter centain tases abbotutely neceflary for the carrying on of the war. By this Louic was fo provoked, that he haprefeel the fourth and firth chom bee, of inguefte, the raembers of which had lillit.

 guthe d then, by their oppofition to his will. He comnonden tice bull Uhigenitus to be refpeed, and prohibited the lealar judges from orderias the admi. nithration of the facrament:. On this 15 coanellors $0:$ the great charaber refigned their offices, and $12+$ nema cers of the diferent paliaments followed their e:ample; and the molt grievous difontents took place throughout the kingdon. At attempt was made by a turatic, name. 1 Damien, to allallinate him; and the King was actutlly wounded, though thightly, between the ribs, in the jrelence of hi fon and in the midta of his guards. The allatin was put to the moll exquifte tortures ; in the minit of which he perfinted, in the molt obitinate manner, to declare that he had no intention to kill the king; but that his dehga was only to wound him, thit Gud might touch his heart, and inclime him to reatore pace to his dominions, टic. Thefe expretions, which undult tedly indicated inf.. nity, had no effect on his mercilefs jud es, who configned him to one of the molt hurrid deaths the ingeruity or cruelty of man could invent. This atterii $t$, havever, feems to bove had tome elfoct upon the king; for he foon aiter bathed the archbihop of Paris, who had been recalled, and once more accommodated raters
## 16. with his parliament.

The unfortunate event of the war of 1755 had brought the nation to the brink of ruin, when Louis implured the atiillance of Spain; and on this occafion the celebrated Famiiy Compaz was figned; by which, with the fingle exception of the American trade, the fubjects of France and Spain are naturalized in beth kingloms, and the enemy of the one fuvercign is invariably to be looked upon as the enemy of the other. At that time, however the affittance of Spain availed very little; both powers were reduced to the luweit ebb, and the arms of Britain were triumphant in cvery quarter of the globe. See the article Beitimis.

The peace concluted at Paris in the year 1763 , hough it freed the nation from a moll deftructive and bloody war, did not reflore its internal tranquillity. The parliament, cager to purfue the victory they had iormerly gained over their religious enemice, now direated their efforts againd the Jefuits, who had ubtained and enforced the bull Unigenitus. That once towerful order, however, was now on the brink of deAruction. A general deteftation of its members had takea place throughous the whole world. A confpiracy formed by them againt the king of Portugal, and from which he narromly eicaped, had roufed the indignation of Europe, and this was thill farther inThaned by fome frautulent practice of which they had been guilty in France. Le Valette, the chief of their onifionaries at Martinico, had, ever ince the peace of Aiv-la-Chapelle, carried un a very extenfive commerce, n:Somuch that he even afpired at monopolizing the "hole Welt India trade when the war with Britain commenced in 1755. Leonay and Goulire, merchants at Marfeillea, in expectation of receiving merchandife to the value of two millions from him, had accepted of bilis cirawn by the Jefaits to the amoent of a milion and a half. Unhappily they were dilappointed by the vall number of capteren made by the Britilh; in cotingence of which they wore obliged to apply to tie Siciety of Jefuits at large: Wat they, either ignc-

ance. fuffered the merchants to ftop paynent ; and thus Franee. not only to bring ruin upon themfelves, but to in. whe, as is ufual in fuch cafes, a great many others in the fame calamity. Their creditors demanded indemnification from the Society at large; and on their refufal to fatisfy them, brought their caule before the parliament of Paris. That hody, eager to revenge themiclves on luch powefful adverfaries, carried on the mofit violent perfecutions everywhere againif them. In the courfe of thele, the velume containing the conditution and government of the order ittelf was appealed to, and produced in ofen court. It then appeared, that the order of Jefuits formed a diflinct body in the fate, fubmitting implicitly to their chief, who alone was abfolute over their lives and furtunes. It was likewile difcovered that they had, after a former expultion, teen admitted into the kingdom upon conditions which they had never fulfilled; and to which their chiet had obitinataly refuled to fubfcribe; confequentiy that their exithence at that time in the nation was me:ely the effect of toleration. The event was, that the uritings of the Jeluits were proncunced to comain doctrine taberlive of all civil government, and injurions to the lecurity of the facred perfons of fovereigns: the attemrt of Damien againft the King was nttibuted to them, and every thing feemed to prognolticate their foeedy diffolution. In this critical moment, however, the king interiered, and by his royal mandate fufer ied all proceedings againt them for a year ; a plan of accommodatio: was drawn up, and fubmitted to the pope and general of the order: but the latter, by his ill-timed haughtinefs, entirely overthrew the hope of reconciliation. The king withdrew his protection, and the pariliament redoubled their efforts againit them. The bulls, briefs, conflitutions, and other regulations of the Society, were determined to be eacroachments on authority, and abufes of government ; the Society itfelf was finally diffolved, and its members declared incapable of holding any clerical or municipal offices; their colleges were feized; their effects conffcated, and the order annihilated ever fince.

The parliament, having gained this victory, nex: made an attempt to fet bounds to the power of the hing himelf. They now refufed to regifter an edict which Louis had iflued for the continuance of fome and his partaxes which hould have ended with the war, and likewife to conform to another by which the king was enabied to redeem his debts at an inadequate price. The court attempted to get the edicts regifered by force, but the parliaments everywhere feemed inclined to refill to the laft. In 1766, the parliament of Britany refufed the crown a gitt oi 700,000 livres; in confequence of which they were lingled out to bear the weight of royal vengeance: but while matters were on the point of coming to extremities, the king thought proper to drop the procets altogether, and to publiih a yeneral amnelly. The parliaments, however, now affected to defpite the royal clemency; which exalperated the king to fuch a degree, that he ordered the cuenfedlors of the parliament of Brittany (who had refufed to. refume the functions of which he deprived them.) to be included in the lift of thofe who were to be dratied for millitia; and thofe upon whom the lot fell were inmediately obliged to join their refpective regi-

France ments; the rall being conployed in fumang the city guard. The parliament of Paris remonilrated $t$, fieceIy upon this conduet of the king, that they atio fall under his cenfure; and Louis in the mon cuphicit manner declared, that he would fufier no earthly power to interlere with his will; and the parlaments were for the prefent intimilated ints fuomilion.

The interval of donellic tratmuillity which now tow place, was employed by the king in humbling the pride of the pope, who refufed to recal a brief he had publithed againtt the duke of Parma. On thi the French monarel reclaimed the territories of Avignon and $V \mathrm{e}$ raillin ; and while the pontiff denourced his unavaling centures againt him, the mariuis de Rochecotart, with a ingle regiment of fodiers, drove out the troups of the pope, and took polieflim of the tentitonies in queflion.

A more formidable oppolition was made by the natives of the tmall inland of Corlica; the fovercignty of which had been transferred to France by the Genofe its former matters, on condition that Louis hould reinfate them in the polfelfon of the illand of Caprala, which the Corficans had lately reduced. Thefe illanders defended themelves with the molt defperate intrepidity ; and it was not till after two campaigns, in which feveral thoulands of the bravelt troops of France were loft, that they could be brought under fubje tion.

The fatistaction which this unimportant conque?t might afford to Loui, was clouded by the diftref of the nation at large. The Eaft India Company had totally failed, and mott of the capital commercial houics in the kingdom were involved in the fame calamity. The miniter, the duc de Chuifeuil, by one defperate ftroke, reduced the interett of the fund to one half, and at the fame time took away the beneft of the fiurvivorihip in the tontines, by which the national credit was greatly affected; the altereation betwist the kins and his parliaments resived, and the difenfions became worle than ever. The duc de Choilenil attempted in vain to conciliate the differences; his chort tended on'y to bring misfortunes upon himfeif, and in 17,7 he was banshed by the king, who fufpected him of tavaring thee ponular party two mulh; and this was foun ater followed by the banilhment of the shole parlia. meat of Pari, and that by the bamimment of a mamber of others; west paliaments being everywhere chofen in place of thufe who had been evpelled. The feople were by no mean difpofed to phy the fime regasd to theit new parliaments that they had done to the old ones ; but every appearance of oppaitiun was at laft fienced by the abfolnte authority of the kius. In the midst of this premtutude of power, however, which hee had fo ardently delned, his health daly dealined, and the end of his days was evidently at no great diftance. As he had all along indalged himlelf in fenfual pleafures to the ere teit exceli, fo now they prowed the immediate means of his deftruclion. His favourite mitroli, Madame de Pompadour, who for a long time governed him with an abtulute fray, had long fince been dead, and the hing had for fome time been equally entlaved by the charms of Madame dua Barre. At laft even her heauty prosed infufficient to evate defire; and a fuccetion of mitrelis bectame necelfary to roufe the languid appetite of the hing. One
of thete, 1...ays. inicele! with the

 be given him ly the phofician.
 afcended the throne in the yen 177 , ia the 2 ot year a of his age: and to lecure himfelf , chit the dicatatm, XVI. which had proved fital to his predecelo:, wbunitel to inoculation, with fewcral others of the raya! fanily. Their quick and ealy reonery contributed mach io ex. tend hat practice throughout the kimgdom, a d to semore the prepudices which had been entertained sugint it.

The king had no fooner regained hiv lealeh, than he applied himfelf diligently to extinguih the differencos which had take: place betwint lis prelecetfor and the people. He removed thote from their employmert. who had given caufe of complaint be their aroitraty and opprelfive conduct ; and he conciliated the aftec. tion of his fubjects by removing the new parlianant and recalling the old oner.

But though the prudence of Louis had fugenfed to him thefe complinces, he endeavomred nill th peferve pure and entire the royal authority. He esplained his intention by a fpeech in the erat chane to of parliament. " The ftep that he had taken to enfure the tranquillity and happinefs of his fubjecte, ow ht not (he obferved) to invalidate his own authority ; wal he hoped, trom the zeal and attachment of the prefort afembly, an example of lubmiffion to the rell of his fubject. Their repeated refitance to the commands of hin grandfather lad compelled that monarch to maintain hiv prerogative by their banihment ; and they were now recalled, in the evpectation that they would quietly exercife their function, and difplay their ana. $^{\text {ras }}$ titude by their obedienec." He concluded with declaring, " That it was his defire to bury in ublivion all patt grievances; that be thould ever bebold with extreme diapprobation whatere: might tend to (tate divifous and diturb the general tranquillity; and that Iti, chanecilor would read his ordinance to the afien:bly, from which they night be atlured t.e would net fuffer the finalient deviation to be made." That ordimance wat concived in the mofl expli, it terms, ated was inmediately regifered by the hinis commathe. The anticle of it limited within very notron bound the pretenfions of the parliament of Parin: The mem.hers wete forbiden to look upon themives :a we body with the other parliaments of the kingdom, or to take any ! tep, or aflume any title, that might tond tosward or imply fuch an union: They wese eativi.ed never to reliaguim the adminillation of public jotiice, escept in cafer of abfolute neceffits, for whach the firft prefident was to be refpontille to the king; and it was added, that on their difobedience the grand council might replace the parliament, without any new edict for the purpofe. They ware bill how ver germited to enjoy the right of remonflatiles hefore the regittering of any edict or letters patent which they might conceive injurions to the welfare of the pople, provided they prefersed in their reprefentation the reljuest due to the throne. But theie remonitrances nere not to be repeated; and the parliament, if they proved incffectual, were to regiller the edict objected to within a month at farthert from the firll day of it

$$

ritarce beins publiticd. They were forbidden to inlue any ar-- rets which might excite trouble, or ia any manner retard the exceution of the king's ordinances; and they were aflased by the king himflf, at the conclufion of this code for their future conduct, that as long as they adhered to the bounds prefribed, they might depend upon bis countenance and protection. In mort, the terms on which Louis confented to re-eftablily the par1 Baments were fuch, that they were reduced to mere $y_{i}$ hers, and the worl of the ling itill continued to be ice only law in the kingdom. The archbinop of Pa--is, who had likewife pefumed to rate fome commotions with regard to the bull Unigenitu, was obliged to fubmit; and feverely threatened if he thou'd afierwasds interfere in fuch a caufe.

The inal conqueft of the Coricans, who, provoled By the oppreffion of their governors, had once more citen ${ }^{\text {rted }}$ to regain their former liberty, was the frit event cf:mportance which took place after this reforation of trancuility : but the kingdom was yet filled wh diforder from other caufe: A farcity of corn happening to take place juit at the time that fome regulations liad been made by M . Turgot the new financier, the populace rofe in great bodies, and committed fuch outrages, that a military force became abfulutely neceffary to quell them; and it was not till upwards of 500 of thele milerable wretches were deflroyed that they could be reduced. The king, however, by his prudent and vigorous conduct on this occafion, foon put a fop to all riots, and eminently dicplayed his clemency as well as prudence in the methods he took for the reftoration of the public tranquillity.

The humanity of Louis was next hown in an edict which le caufed to be regifered in parliament, lentencing the deferters from his army in future to work as flaves on the public roads, inkead of puniking them as formerly with death; and with equal attention to the general welfare of his fubjects, he feized the moment of feace to fulfil thofe promiles of economy which on his acceffion he had given to the people. Various regulations took place in confequence ; particularly the fuppreflion of the moufquetaires and fome other corps, uhich being adapted more to the parade of guarding the royal porfon than any real military fervice, were fupported at a great expence, without any adequate return of henefit to the itate.

Particular attention was allo paid to the flate of the marine ; and the appointment of M. de Sartine in ${ }^{1776}$ to that department did honour to the penetration of the fovcreign. That miniller, fruitful in refources, and unwearicd in his application, was incelfantly engaged in augmenting the naval frength of his country; and the various preparations that filled the ports and docks created no fmall uneafinefs to the Britifh court.

The next appointment made by the king was equally happy, and in one refpect fingular and unpreicdented. M. Turgot, though poffefled of integrity and induftry, had not been able to command the public confidence. On his retreat, M. Clugny, intendant general of Bourdeaux, had been elevated to the vacant poft : but he dying in a very fhort face, M. Taboureau des Reaux was appointed his fucceffor; and the king foon after affuciated with him in the management of
the finanes M. Nechar, by birth a Swif, a:ld by religion a Proteltant. That gentleman, in the preceding reign, had been chofen to adjut fome difierences between the Eaft Iudi. Company and the crown; and lad dichareed his trut in a manner which gained the Nent of if liad difcharged his truft in a manner which gained the Necharts
approbation of both parti-s. Pufffed of ditinguifh- the dureced asilities, his appointment would have excited no fur- tim of the prife, had it not been coutra:y to the contant policy of France, which had carefully excluded the aliens of her country and fath from the controul of her revenue. It now flood formard as a new inftance of enlargement of mind and liberality of fentiment; and will to pofierity mark the prominent features of the reign of Louis XVI.

Athough the French monarch was of a pacific difpofition, and not deflitute of generofity of fentiment; yet his own and the public exultation had been openly and conflantly proportioned to the fuccefs of the Americans in their conteft with Britain: the princes of the Ther ${ }^{173}$ blood and the chief nobility were eacer to embark in privately fupport of the caufe of freedom; and the prudence of affitt the the king and his mott confidential miniters alone re-Americars Arained their ardour. The fatal events of the former war conteft were fhill imprefled on the mind of Louis; and he could with brinot readily confent to expofe his infant marine in a con- tain; tell with a nation who had fo frequently afierted the dominion of the feas, and fo lately broken the united ftrength of the houfe of Bourbon. At the fame time, he was fenfible that the opportunity of humbling thofe haughty illanders ihould not be entirely neglected, and that fome advantages flould be taken of the prefent commotions in America. Two agents from the Unit$\epsilon d$ States, Silas Deane and Dr Benjamin Franklin, had fucceffively arrived at Paris: and though all audience was denied them in a public capacity, ftill they were privately encouraged to hope that France only waited the proper opportunity to vindicate in arms the independence of America. In the mean while, the American crufers were hofpitably received into the French ports ; attillery and all kinds of warlike fores were freely fold or liberally granted to the ditrefs of the colonifts; and French officers and engineers, with the connivance of government, entered into their fervice.

Some changes were about this time introduced into the difierent departments of itate. The conduct of M. Neckar in the finances had been attended with univerfal approbation; and M. Taboureau des Reaux, his colleague, had refigned his fituation, but itill retained the dignity of counfellor of tate. To afford full fcope to the genius of M. Neckar, Louis determined no longer to clog him with an affociate: but, with the title of Director General of the Finances, fubmitted to him the entire management of the funds and revenue of France. In the enfuing year, the Count de St Germains, fecretary at war, died ; and the prince de Montbarey, who had already filled an inferior fituation in that department, was now appointed to fucceed him.

In the mean time, Louis's negotiations with foreign courts were not neglected. He concluded a new treaty of alliance with Switzerland; vigilantly obferved the motions of the different princes of Germany on the death of the elector of Bavaria; and when clofely queftioned by the Englith ambaffador, Lord Stormont, reffecting the various warlike preparations which were diligently

France diligenty co inued through the hiast: a. ... rephind, That at a time when the teas were covered with L.anlih flects and American cruifers, and when fich armien were fent to the New World as Dad imer betore appeace 1 there, it became prudent for him allo to arm tor the fecurity of the co'ulies and the rotection of the commerce of Frane. The king wan ant itromet at the fame time, that the remon?rac co of Great B.itain, and the importunities of the agente of the United State, woald foon compel him to adopt iome decian line of conduct. This wis hateried by a ne:\% evert
dithrous to Briain ; the falure of General Bur gan ne's expeutition, and the capture of his army. The nens of that event was received at $\mathrm{P}_{\text {ari }}$ with unbounded exuitation. M. Sortine, the marme fuperintendant, w: eager to meafure the maval Arength of France with that of Great Britain; the rucen, who had In , e conded the application on the Amorican agents, now elpoufed their ca: le with frehardour; and the pacific inclinations of Loui being overborne by the fuggettions of his miniters and the influence of the queen, it was at length determined openly to acknowledge the independence of the U'inted States.

D: Franklin and Silas Deane, who had hitherto acted as private arents, were now acknowled ed as public anballadors from thofe flates to the court of Verfailles; an:l a treaty of amity and commerce wis figned between the two powes in the month of Felveary $17-9$. The duke of Noailes, ambaliador to the court of London, was in the month of March in. ilructed to acquaint that court with the above treaiy. At the fame time be declated, that the contrating parties had paid great attention not to tlipulate any exclufive advantages in favour of France, and that the United States had referved the liberty of treating with every nation whatever on the fame forting of equality and reciprocity. But this itipulation was treated by the Britith with cuntempt; and the recal of Lord Stormont, their ambaflador at Verfailles, was the fignal for the commencement of hoitilities. - The events produced by this war are related under the articles America, Britais, and Indostas. Here our chief bufinefs is with domerlic tranfactions, the meafures of the cabinet, and the internal coonomy of the flate.
In the year 1780 new changes in the French minifry took place. M. Bertin had refigned the office of fecretary of itate; the prince de Montbarey had re-

## Removal oiceeded by the Marquis de Segur. But the mott im-

M. de Sar- portant removal was that of M1. Sartine, who had for tine.
feveral years prefided over the marine department, and whofe unsearied application and ability had raifed the naval power of France to a height that atturided Europe: but his colleagues in the cabinet loud!y arraigned a profufion, which would have diverted into one channel the whole refources of the kingdom; and his retreat opened a road to the ambition of the Marquis de Caltries, who was appointed to fupply his place.

This year, the king fised on the anniverfary of his birth day to render it memorable by a new inllance of humatity: and he aboilhied for ever the inbumin cuftom of putting the queffion, as it was called, by turture; a cuflom which had been fo ettablihed by the pracice of ajee, that it fermed to be an infeparable pat of
 his na zinere to the culc of li, fiborn, difining at unce above $\&=$ ollicos, cionging to his cuats.
 excit. 1 teve ar loy the difmition of their thanite of ar. miniter, hi. Nohatr. If had comeived tha artums bue popal r mafect of furyorting a war dores with out traco ; and the rideconom, whathe le.jintro. diced into all the departanent, of the royal houtinold, and the various refources that prefonted themieino to hi fertile gernits, had fupported him amidit the dit? culties that attended thesthen. But his aulierity oi tomper had not residerd hiz o ef why acceptable to the fowereign and his fubjects; and t.espented reform he had recommeaded were ıephe... as inconfitu: with the diguity of the ruman ; 1. .... therefore in 1791 dimilled from his vilice of comy allet-general : and M. Joli de Itcuri. comielior it wheppont. ed to tha: important depurment. I: defeat of the contride Gre happened next year, and imprefied the hing fom with genemal gricf and tonftemation. Im menfe preparativis were, bowever, made for the operatinns of 1783 ; and ja conjunction with the courts of Madrid ard tl e Hague, Luuis was determined this year t) make the moit powerful efforts to bring the war to a conclufion. But in the midh of thefe preparations, the voice of peace was a_sin heard; and Louis was induced to liften to the profiered mediation of the two firt po-Pace cur. tentates in Europe, the emperor of Germany and the ctused. emprefs of Rulfia. The count de Vergennes, whe tilit occupied the poll of fecretary of foreign affars, was appointed to thent with Mr Fitzherbert the Britint miniller at Brufiels, but who had lately proceeded to Paris to conduct this important nequiation. Th, way was already fmoothed tor the refloration of public tranquillity, by proxifional articles figned at the conclufion of the lait year between the dates of America and Great Britain, and which were to contitute a treaty of peace finally to be concluded when that between France and Great Brituin took place. Preliminary articles were accordingly agreed upon and fign ed at Verfailles: thefe were foon after fucceeded by a definitive treaty; and France, throughout her extenfive dominions, beheld peace once more ettablihed. Though the late war had been attendel by the mol brilliant fuccefs, and the independence of America feemed to Atrike deep at the fource of her ris.l's power, yet France herfelf had not been entirely free from in convenience. The retreat of M. Neckar, had, as we have already obferved, diminihed the public conndence; three different perfons who had fivee tranhently occuped his pot, increafed the jealoufies of the people ; $\cap$ in ard the failure of the celebrated Caifie d'Efcompte Cate completed the univerfal conlernation.
That bank had been ellablitied in the year 17,7 ( . The plan of it was formed by a cumpany of private adventuress, and its capital was fixed it $502,0=01$. fierling. The profeffed defign of the Company was to difcount bills at thort date, at the rate of four per cent. per annum : but as this interell could never be: an equivatent for the capital funk by the proprietors, they were intrulted with the additional power of illuing rotes to the amo:nt of their cupitat, which, as tley

## F R 1 [102] F R A

—. We tove time of being converted into fpecie, ni i it be often whutarily taken by their cutomers irom mere convenience. The reputation of the bank
 $v_{\text {... : : } 1 \mathrm{i}}$ at the higheit, when to the aitonimment of the r. $\because$ it it fudden!y 1 topped parment on the $2 d$ of Octobu: 1 -S $\mathbf{3}$. The caute altinned was an uncommon farcity of pecie: But the public fufpected that the failure arote from a loan fecretly made to government; and what confrmed the fugicion was, that government about the fame time floped payment of the bills drawn up them by their army in America.

Whatever was the caufe of this event, the king was prevailed on to extend his protection to the Company. By four fucceflive edicts the banks in Pais were ordered to receive the notes of the Caife d'Efcompte as currency; and a lottery with a ftoch of one million therling, tedeemable in eight vears, being eftablithed, the tickets were made purchafable in notes of the Caiffe d'Efompte. By thefe expeaients the public confidence in that bank was revived, its bufinefs increafed, and its llack rofe to above double the original fubfcription ; the bills from Anterica were at the fame time put in a train of payment, and public credit was reftored throughout the kingdom. Some compenfation alfo for the expences that had been incurred during the late war, wav drawn from a treaty with the United States of America. Thefe engaged to reimburfe France in the fum of 18 millions of lives, which had been advanced in the hour of their diftrefs; and Louis confested to receive the money, as more convenient to the States, in the fpace of 12 yedrs, by 12 equal and annutt payments.

The general peace was foon after follored by a parTreas be- ticular treaty between France and Holland, which was Frame and effected with great addref by the Count de Vergennes. Holland.

It included all the principles which can ferse to cement in the clotelt union ditinct nations under diftinct government, ; and by which they may mutually participate, in peace or in war, of good or of evil; and in all cafes adminiter the moft perfect aid, counfel, and fuccour to each other. It alfo prescribed, if their united good othices for the prefervation of peace fhould prove ineffectual, the amiftance they were to afforl each other by fea and lend. France was to furnih Holland with $1=, 200$ effective infantry, 2000 cavalry, with 12 thips of the line and 6 frigates. Their Hich Mightineffes, on the other bide, in cale of a marine war, or that France thould be attacked by fea, were to contribute to her defence fix thips of the line and three frigates; and in cafe of an attack on the territory of France, the States General were to have the option of furnibing their land contingent either in money or troops, at the eftimate of 5000 infantry and $1002 \mathrm{ca}-$ valry. Further, If the ftipulated fuccours thould be infuffcient for the defence of the party attacked, or for procuring a proper peace, they engaged to athitt each other with all their forces, if neceffary ; it beiner however agreed that the contingent of troops to be furAhed by the States General hould not eveced 25,005 indatry and to00 cavalry. It was further added, tha: neither of the contracting powers thould difarm, $v:$ make or receive propofals of peace or truce, without the conlent of the other: they promifed alfo not so ccistas aty future alliance or engagement what-
cver, dicelly or indirectly, contrary to the prefent Fratec, treaty : and on any treaties or negotiations being propoled which might prove detrimental to their joint intereft, they plecged their faith to give notice to each other of fuch propolals as foon as made.

Thus was Holland now converied into the firm ally of that power againit whofe encroaching fpirit the had formerly armed the mof powerful kingdoms of Eiirope; while France having afferted the independencr of America againt Great Britain, and having converted an ancient and formidable foe into an ufeful friend, feemed to have attained an influence over thr nations of the earth that the had never before beea poffeffed of.

But however exalted her prefent fituation might appear, the feeds of future commotion were already apparent to an attentive obferver. The applaufe tha: had attended the parliament of Paris in their itruggles with the late king might be confidered as the firft dawn of freedom; the language of that affembly had boldly inculcated to their countrymen their natural rights, and taught them to look with a lefs enraptured eye on the luftre that encompaffed the throne. The war in ConfeAmerica had contributed to enlarge the political ideas quence to of the French: they had on that occafion ftood forth as the champions of liberty, in opporition to regal power ; and the officers, who had acted on that confpi-rite cuous theatre, accuftomed to think and feak without tween Erireliraint, on their return imparted to the provinces of tain and France the Hame of freedom which had been kindled in the wilds of America. From that moment the French, inftead of filently acquiefcing under the edicts of their fovereign, canvaifed each action with bold and rigid impartiality; while the attachment of the army, which has ever been confidered as the fole foundation of defpotifin, gave way to the noble enthufiafin of liberty.

We have already noticed the public dillatisfaction that had attended the difmifion of M. Necker; histranfient fucceflor, M. de Fleury, had retired from the management of the finances in 1,83 , and the more tranfient adminifration of M. d'Omeflon had expired in the fame year that gave it birth. On his retreat, M. de Calonne, who had fuccelfively filied with acknow- ${ }^{1} 150$ ledged reputation the office of intenciant of Mentz, and meot and afterwards of the provinces of Flanders and Artois, was mealures of nominated to the poft of comptroller-general. This ione. gentlcman, flesible and infinuating, eloquent in converfation and polifhed in his matners, fertile in refources and liberal in the difpotal of the public money, foon rendered himfelf acceptable to the fovereign. But he did not enter upon his new and arduous flation favoured by the breath of popularity : he was reported to be more able than confillent, and not to have tempered the ardour of his firit by the feverity of deep relearch : and the people, amidt repeated loans, regretted that fevere fimplicity which had characterized the adminitration of M. Necker.

It was the bold and judicious meafures of Calonne, however, that reftored credit to the Caifte d'Efcompte, which had ftopped payment a few weeks before his atceflion. His next meature, in 1-84, the eftablihment of the Caife d'Amortiftement, or finking fund, was entitled to a ftill higher degree of applaufe. The plan of that fund was fimple and moderate: It was to pay annually by government, into the hands of a board let

Fronce. apart for that purpofe, the eatire intereft of the nationa! debts, whether in flock or anmuties, tosether with .ai additional furn of 122,2021 . The amnities that vould be extincuilied every year were etimated at 50,2501 ; and in that proportion, the fumi let apat for the redemption of the national debt would annually increafe. 'The operation of this new fand was limited : the term of 25 years; and during that term the anmund receif: of the Caife d'Amortifement is declared unalterable, and incapable of being diveited to any othe: object.

The principal meafure of the next year was the eftablifhment of a new Latt India Company, (the condtitutions of which have been already detailed: fee Covpany);-a meafure not equally commendable with the preceding, and which did not fail to excite viol.nt complaints. The time, however, was now ay, proaching, when the necellitics of the Itate would compel him to mealures itill more unpopular, and deitined to undergo a feverer fcrutiny. Although peace had been re-eltablihed throughout Europe for threc years, yet the finances of France feemed farce affected by this interval of tranquillity, and it was found requifite to clofe every year with a loan. The public expenditure of 1785 might probably feem to fanction this mealure. It had been thought proper to fortify Cherbourg upon a large and magnificent fcale; the c'aim of the emperor to the navigation of the Scheldt had obliged the French to increale their land forces, either to form a refpectable neutrality, or to allit effeetually their Dutel allies; and the marquis de Caitries, fond of war, and profufe in his dengns, had not fuffered the naw, which MI. Sartine had furrendered iato his hands, to declise dusing the interval of feace. The treaty of commerce concluded in the year 1786 with Great Britain was a new furce of difcontent. Though regarded by the Engli:h mamfacturers as far from advantareous, it excited in France lill louder murmurs. It was reprefented as likely to extinguilh thote irfant eftablithments, which were yet unable to vie with the manufactures of Eorland that had attained to maturity; and the market that it held out for the wines and oils of France was paffed wer in flence, while the dilrefs of the artifan was painted in the mont ftriking colours. But when the edict for regiflering the loan at the conclufion of the laft year, and which amounted to the fum of three millions three hundred and thirty thoufand pounds, was prefented to the parliament of Paris, the murmurs of the people, through the remonitrances of that afiembly, affumed a more lezal and formidable appect. The king, however, fignif.ed to the felect deputation that were commifioned to convey to him their remonitrances, that he cxpected to be obeyed without farther delay. The ceremony of the regittering accordingly trok place on the neat day; but it was accompanied with a refolution, impurting, " that public economy :as the only genuine fource of abundat revenue, the only means of proviling for the necelitic. (f the inate, and relloring that credit which borrowing ind reduced to the Lrink of ruin."

I he king was no fooner informed of this thep, than le commanded the attendance of the graad deputation of perliament; when he erazed tom-their necord,
the refolstion thatt … 1 becas :doptec, an. 1 obferves, that though it was his plemime th $\therefore$ the parlianent - thould communicate, by is refeelitil refrelentations, whatever might concern the good of the pubiic, yet he never would allow then fo fis to :iffe li. clemenc as to erect thentelves into the cent on of li. envernment. At the fame time, more firmety to matk $1 . i$ difpleafure at their e:zpotultaions, he tureseded a. of their officers, sho had appeared mons attes in fos warding the obnoxious relulution.
M. de Calome, however, though gratiod io: it approbsticy of his forercign, could not but feel him felt deeply mortified by the oppofition of the 1 . liament. His attempts to conciliate that aflembly ?au? proved ineflectual : and be experienced their inne sibis averfion at the critical juacture when their acpuieteene. might have proved of the muth effential fersice: A ansious inquiry into the tate of the public franes had convinced him that the espenditure by far execes ed the revenue. In this fituation, to impule new tase was impracticable; to continue the method of bourwing was ruinons; to have recourfe only to ecomomic it reforms, would be found wholly inalequate ; and he lefitated not to declare, that it would be improltible to Ilace the finances on a folid batis, but by the reformation of whatever was vicious in the conftitution of the flate.

To give weight t? this reform, M. dc Calome was fenfible that fomething more was receliary than the royal authority; he perceived that the parkament was neither a fit infrument for introducing a new crder into public affairs, nor would fubmit to be a pative machine for fanctioning the plans of a mirinur, ever if thofe plans were the emanations of perfect vildom. Though originally a body of lawyers, indebted fur their appointments to the king, there was not an attribute of genuine legillative aliembly but what they feemed defirous to engrols to themfelves; and they hed been fupported in their pretenfions by the plaudits ot the people, who were fenfible that there was no other body in the ration that could plead their caule agninit. royal or mianterial oppreflion. 'To fupprefs, therefore, the only power of controul that remained, and to render the government more arbitrary, was deemed too perilous a meafure : yet to leave the parliament in the full poffeflion of their influence, an inflaence that the miniter was convinced would be cxerted againtt him, was at once to render his whole fyltem abortive.

In this dilemma, the only expedient that fuggented iffif was to have recourfe to fome other afiembly, more dignified and folcmn in its character, and which hoond in a "reater degrec confit of member, from the various orders of the ftate and the diferent prosinces of the kingdom. This promifed ${ }^{\circ}$ ) be a popular meafurc; it implicel a detcrence to the people at large, and might be expected to prove highly acceptable. But the true and legitimate atembly of the nation, the Sates General, had not met hinre the year $161+$; hor could the miniter fhatter himfelf with the hope of obtaming the toyal afient to a mecting which a defpotic fovereign could not but regard with fecret jealualy, 195 Another aftembly had occahonally leen lubftituted in $1 \pi^{\prime} \cdot m^{\prime}$.. the room of the States Gonemil : this was dithertitied the tu* by the title of the N.i.ics, and cominled of : mata

## F R A [10q] F R A

Fiasce ben of perions from all parts of the hingdom, chiety filected from the higher orders of the ftate, and nominated by the king himfeif. This afiembly had been convened by Henry IV. again by Louis XIII. and was now once more fummoned by the authority of L.ouis XVI.

The writs for calling them together rere dated on the 29th of December 1,86 ; and they were addrefled to feven princes of the blood, anine dukes and peers of France, cight feld marefcha's, twents-two nobles, eight counfellors of thate, fcur mafters of requetts, eleven archbifhops and bilhops, thirty-feven of the heads of the law, twelve deputies of the pays d'ctats, the lieutenant civil, and tiventy-five magilrates of the diferent towns of the kingdom. The number of nembers was $14+$; and the 29 th of January 1787 was ine period appointed for their meeting.

Upon the arrival of the notables at Paris, however, the minitter found himfelf yet unprepared to fubmit his fyftem to their infpection, and poitponed the opening of the council to the 7th of February. A fecond delay to the $14^{\text {th }}$ of the fame month was occationed by the indifpofition of M. de Calonne himlilf, and that of the count de Vergennes prefident of the council of finance and firit fecretary of ftate; and a third procraftination was the neceflary refult of the death of the count on the day previous to that fixed f.r the opening of the meeting. He was fucceeded in the department of foreign affairs by the count de Montmorin, a nobleman of unblemithed character. But his lofs at this critical juncture was feverely felt by M. de Calonne; he alone, of all the minifters, haviny entered with warmth and fincerity into the plans of the comptroller general. The chevalier de Miromefnil, keeper of the feals, was avowedly the rival and enemy of that ifatefman. The marefchal de Caftries, fecretary for the marine department, was perfonally attached to M. Neckar; and the baron de Breteuil, lecretary for the houfehold, was the creature of the queen, and deeply engaged in what was called the Auftrian fyitem.

It was under thefe diffictilties that M. de Calonne, on the 2ad of February, firll met the afiembly of the notables, and opened his long-expected plan. He began by ftating, that the public expenditure had for centuries paft exceeded the revenue, and that a very confiderable deficiency had of courfe exifted; that the Miffifippi fcheme of 1720 had by no means, as might have been expected, reftored the balance; and that under the economical adminittration of Cardinal Fleury the deficit ftill exifted; that the progrefs of this derangement under the lait reign had been extreme; the deficiency amounting to three millions Iterling at the appointment of the Abbé Terray; who, howcver, reduced it to one million fix hundred and feventy fise thoufand pounds; it decreafed a little under the thort adminiftrations that followed, but rofe again in confequence of the war, under the adminiftration of M. Nechar; and at his own acceffion to ollice, it was three nillions three hundred and thirty thouland pounds.

In order to remedy this growing evil, M1. Calonne recommended a territorial impoft, in the nature of tie England land tax, from which no rank or order of men bere to be exempted; and on ixauiry into the
pofleffions of the clergy, which hitherto had bocn France. deemed facred from their proportion of the public burdens: the various branches of internal taxation were alio to undergo a flrict examination ; and a confiderable refource was prefented in mortgaging the demefne lands of the crown.

The very necellity for thefe reforms was combated with a degree of boldnefs and force of reafoning that could not fail of deeply imprefling the afiembly; and inflead of meeting with a ready acquiefcence, the comptroller general was now launched into the boundlefs ocean of political controverfy. M. Neckar, previous to his retirement, had publifhed his Compte rendu au Roi, in which France was reprefented as pofleffing a clear furplus of 425,000 pounds Sterling: this performance had been read with avidity, and pro-Op, fed by bably contributed to eftrange from the author the royal countenance; but the credit of it was ably vindicated by M. de Brienne archbihop of Thouloufe.
M. de Calonne met with a ftill more formidable adverfary in the count de Mirabeau. This extraordinary man, refllefs in his difpofition, licentious in his morals, but bold, penetrating, and enterprifing, had occafionally vilited every court in Europe. He had been admitted at one time to the confidence of the minifter; and had been directed, though in no oftenfible character, to oblerve at Berlin, the difpofition of the fucceffor of the great Frederick; in this capacity he was frequently expofed to neglect and difappointment ; his letters were often left unanfwered; difguft fucceeded to admiration; and he who had entered the Pruffian court the intimate friend, returned to Paris the avowed enemy, of M. de Calonne: While the archbifhop arraigned the undertanding, the count impeached the integrity, of the comptroller general.

The eloquence of M. de Calonne, !owever, might have fucceisfully vindicated his fyitem and reputation againft the calculations of Brienne, and the invectives of Mirabeau; but he could not fupport himfelf againft the influence of the three great bodies of the nation. $\mathrm{I}_{4}$ The ancient nobility and the clergy had ever been and by the free from all public affeffments; and had the evil principal gone no farther, it might have been fill perhaps borne nobility, with patience; but through the th meful cuftom of magifelling patents of nobility, fuch crowds of new nobleffe ftrates. ftarted up, that every province in the kingdom was filled with them. The firlt object with thofe who had acquircd fortunes rapidly, was to purchafe a patent ; which, befides gratifying their vanity, afforded an excmption to them and their pufterity from contributing proportionably to the exigencies of the flate ; the magillracies likewife throughout the hingdom enjoyed their thare of thefe exemptions; fo that the whole weight of the taxes fell on thofe who were leatt able to bear them.

The minifter's defign, then, of equalizing the public burdens, and by rendering the taxes general diminihing the load borne by the lower and motl ufeful claffes of peopie, though undoubtedly great and patriotic, at once mited againf him the nobslity, the clergy, and the magillacy; and the evene was fuch as might be expected : the intrigues of thofe three bodies railed againt him fo loud a clemour, that finding it imponthe to flem the torrent, he no: only refigned his

 whech attention was alfo callel to the Pate of afturs in the ree de Culmene prablic of It lland, his new and cofo ally. The prince religa. of Onage had been fripp d of all authority by the ariltocratic party; an !, retiring form the lague, maintained the haduw of a court at Nimepuen. His bro-ther-in-law, hewever, the new king of Pruthin, excrted his endeavours to promote thie interetis of the fladtholder; and, having offered, in concert with France,to undertake the arduous tal of compofing the differ eaces which diftracted the republic, the propofal was received with apparent cordiality by the court of Verfailles. At the fame time it could farce be expected that France would become the imltrument of riftoring the prince of Orange to that thare of powe: which he had before occupied, and thus abandon one of the longett and mont favourite objects of her policy, the eftablihhing a fupreme and permanent controul in the affairs of Holland. Jn fact, the conditions which were framed by the Louveftein faction, as the balis of reconciliation, were fuch as plainly indicated their defign to reduce the influence and authority of the itadtholder within very narrow limits. On his renouncing his right of filling up the occafional vacancies in the ium fenates, he was to be reftored to the nominal oflice of captain general : but he was to be reitrained from marching the troops into or out of any province, without leave from the refpective provinces concerned; and he was alfo to fubfcribe to a refolution pafled fome time before by the fenate of Amfterdam, that the command fhould at all times be revocable at the pleafure of the flates. Had the prince acquie'red in thefe preliminaries, France would have completely attained the object of her long negotiations, and by means of the Louveftein faction have acquired the afcendency that the had repeatedly foucht in the councils of Holland. But under the difficulties that furrounded him, the prince of Orange was admirably fupported and affilted by the genius, the fpirit, and the abilities of his confort: fite firmly rejected every meafure tending to abridge any rights that had been attached to the office of itadtholder; and M. de Rayneval, the French negotiator, having in wain endeavoured to overcome her refolution, broke off the correfpondence between the Hague and Nimeguen, and returned to Paris about the middle of January 1787 .
But the republican party were tot lly difappointed in their hopes from France. The court if Verfailles had indeed long trufted to the natural Arength of this party, and had been affiduous during the whole fummer in endeavouring to fecond them by every fpecies of fuccours that could be privately afforded. Crowds of French officers arrived daily in Holland ; and either received commiffron in the fersice of the fates, or afted as volunteers in thair troops. Several hundreds of tried and experienced foldicrs were felected from different regiments; and teing furnifhed with money for their joimey, and af furances of future favour, were defpatched in frmall parties to join the troops, and help, to dilcifine the burghers and voluntecrs.  dence to the operations of the hing of Pruffit, the court of Verfailles alfo fent orders to equip 16 fili of the line at Brefl, and recalled a fmall figuadrun which had been commiltioned on a fummer' cruile on the coalt of Portugal. But in thefe premarations Louis fcemed rather to regard his own disnity, than to be actuated by any hopes of effectually relieving his allies. All oppofition in Holland might be already conlidered as extinguilhed. The flates aftembled at the Hague had officially notifed to the court of Verfailles, that the difputes between them and the ftadtholder were now happily terminated; and as the circumftances which gave occafion for their application to that court no longer exited, fo the fuccours which they had then requelled would now he unneceffary.

Under thefe circumitances, France could only winh to extricate herfelf from her prefent dificulty with honour. She therefore readily littened to a memorial from the Britifh minilter at Paris: who propofed, in order to preferve the good underitanding between the two crowns, that all warlike preparations fhould be difcontinued, and that the navies of both kingdoms ihould be again reduced to the footing of a peace eltablithment. This was rladly acceded to by the court of Verlailles; and that harmony which had been tranfiently interrupted between the two nations was rethored.

Though the French king could not but fenfibly feel Demeetic the mortification of thus relinquifhing the afrendency moter of which he had attained in the cuuncils of Holland, the flate of his own domeftic concorns and the internal fituation of his kingdom fumihied matter for more ferivus reflection. The difmifition of M. de Calome had left France without a miniter, and almoat w:shout a fiftem; and though the king bore the oppolition of the notables with admir:ble temper, yct the dimp. pointment that he had experienced lunk deep into hig mind. Without obtaining any relief for his molt urgent necelitice, be perccised too late that he had opened a path to the refforation of the an ien contitution of France, which had been undernined by the crafty Louis X 1 . and had been nearly extis, whith by the daring and fanguinary counfels of Richetied under Lorni X111. The notables had inded demeanel themidelves with refpect and moderation, but at the fime time they had not been deficient in tirmets. 1 s. The appointencent of the aschotihon of The ulo..tr, the Alient w vigorous adverfary of M. de Calome, to the entice of 'the comptrolle - gencral, probably contributed to peferve folved. the appearance of $q$ ood bumour in that afien bly ; ?

## F A A ic6 $] \quad \mathrm{F}$ H A

Wance. the proped territorial impot, or general ?and tax, 1 -r whic! wis an objuct fo ardesitly coveted by the cout, was relected. Louis, therefore, deprived of any further hope of rendering the convention fabfervient :o :.is embarrafiments, determined to diflue the afienoly; which he accordingly did, with a very moderate and conciliatory feech to the members on their difnuifion.

Thus difappointed of the advantage which he had flattered himfelf he would have drawn from the acquicfence of the notables, the king was obliged now to recur to the ulual mode of railing money by the royal edicts; among the meafures propofed for which purpofe were the doubling of the poll tax, the re-eltablithment of the third twentieth, and a ttamp duty. But the whole was ftrongly difapproved by the parliament of Paris ; and that aflembly, in the moif pofitive terms, efufed to regitter the edict. Louis was obliged to upply, as the laft refort, to his abfolute authority; and, i) y bolding what is called a bed of jufice, compelled ih.m to enrol the impoft.

The parliament, though defeated, were far from Gubdued; and on the day after the king had held his bed of jutice, they entered a formal proteft againft the edict; declaring, " that it had been regittered againft their approbation and confent, by the king's exprefs command; that it neither ought nor fhould have any force; and that the firft perfon who ihould prefume is attempt to carry it into execution, fhould be adjudged a traitor, and condemned to the galleys." This firited declaration left the king no other alternative, than either proceeding to extremities in fupport of his authority, or relinquilhing for ever after the power of raising money upon any occafion without the content of the parliament. Painful as every appearance of violence muft have proved to the mild difpofition of Louis, he could not confent to furrender, without a Itruggle, that authority which had been fo long exercifed by his predeceflors. Since the commencement of the prefent difcontents, the capital had been gradually filled with confiderable bodies of troops; and about a week after the parliament had entered the proteft, an officer of the French guards, with a party of foldiers, went at break of day to the houfe of each individual member, to fignify to him the king"s command, that he fhould inmediately get into his carriage, and proceed to Troyes, a city of Champagne, about 70 miles from Paris, without 191 writing or fpeaking to any perfon out of his own The mem. houfe before his departure. Thefe orders were ferved berstawilhed. at the fame inftant; and before the citizens of Paris were acquainted with the tranfaction, their magi- itrates were already on the road to their place of ba1 uihment.

Previous to their removal, however, they had prefented a remouftrance on the late meafures of government, and the alaming itate of public affairs. In fating their opinions on taxes, they declared, that neither the parliaments, nor any other authority, excepting that of the three eftates of the kingdom collectively affembled, could warrant the laying of any permanent tax upon the people; and they firongly enforced the reneual of thofe national aflemblies, which had rendered the reign of Charlemagnc fo great and illutatious.

This requistion of the parliaments to re-ciablik the national council, or ftates general, was the more honourable, as the former affemblies muit have funk under the influence of the latter, and returned to their origital condition of mere regiters and courts of law. The confidence and atrachment of the people of confequence rofe in proportion to this inftance of difinterehednefs; their murmurs were openly evprefied in the ilreets of the capital, and the general diffatisfaction was augmented by the flop that was put to public bufinefs by the exile of the parliament.

Tle cabinet at the fame time was apparently weak, difunited, and fluctuating; and continual changes took place in every department of the ftate. Loais, averfe to rigorous counfels, withed to allay the growing difcontent by every conceffion that was confittent with his dignity ; but it was generally believed, that the queen ilrongly difluaded him from any fep that migh.t. tend to the diminution of the royal authority. The influence of that princefs in the cabinet was undoubtedly great : but the popularity which once had accompanied her was 10 more ; and fonte imputations of private levity, which had been rumoured through the capital, were far from rendering her acceptable to the majority of the people ; while the Count d'Artois, the king's brother, who had exprefled himfelf in the moit unguarded terms againit the conduct of the parliament, ftood expofed to all the confequences of popular hatred.

Nor was it only in the capital that the flame of $1 \mathrm{r}-$ berty once more burtt forth; it blazed with equal ftrength in the provincial parliaments. Among various inftances of this nature, the parliament of Grenoble pafied a decree againft lettres de cachet, the moft odious engine of arbitrary power; and declared the execution of them within their jurifdiction, by any perfon, and under whatever authority, to be a capital crime.

The king had endeavoured to foothe the Parifians by new regulations of economy, and by continual retrenchments in his houfehold: but thete inftances of attention, which once would have been received with the loudeft acclamations, were now difregarded under their atfliction for the ablence of their parliament. His majefty, therefore, in order to regain the affections of 192 his fubjects, confented to relfore that affembly; aban-Recalled. doning at the fame time the ftamp duty, and the territorial impott, which had been the fources of difpute. Thefe meafures, were, however, infufficient to eftablifh harmony between the court and the parliament. The neceflities of the ftate ftill continued; nor could the deficiency of the revenue be fupplied but by extraordinary refources, or a long courfe of rigid frugality. About the middle of November 1787, in a full meeting of the parliament, attended by all the princes of the blood and the peers of France, the king entered the affembly, and propofed two edicts for their approbation: one was for a new loan of 450 millions, near 19 millions fterling : the other was for the reeftablibment of the Proteftants in all their ancient civil rights; a meafure which had long been warmly recommended by the parliament, and which was probably now introduced to procure a better reception to the loan:

## I R A [i07 ] I R A

 ifecth of manomun lenstl, fitad with protedions of
 exprefive of the obedience he expected to his edict. Lous p:obah? inacined, that the dreal of that bat nithme it fiom which the men'ers had been fo lately reathed would have enfured the acquiciennce of the aiembiy ; but wo fothe uts permithon announced for evety momeer to delieet his fentments, than he was cumincel, that their firits romained totally unfubdued. I:1 animatel debate took Ilace, and was continued ppontion, and clagrmed at ione irculoms uled in losa. for mine hous; when the hing, wearie.! by perpetual et for a their debates, laddenly role and commanted the edict to be reciltered without further delay. This mealure was mort unexpectedly oppoled by the duke of $\mathrm{Or}_{\mathrm{r}}$ leans, firnl prince of the blood; who, contidering it as an intringement of the right; of parliament, proteted againat the whole procectings of the day as being thereby null and roid. Though Louis could nut conceal his atonimment and dipleature at this decinise flep, he contented himfelf with repeating his orders; and immediately after, quitting the alembly, retired to Verfilles. Oin the king"s departure, the parliament confirmed the protett of the duke of O -leans ; and declared, that as their deliberations had been interrupted, they confidered the whole buinets of that day as of no efect.

It was not to be fuppofel that Lotis would fufier Co buld an attach on his puwer with impunity. Accordingly, a letter was nest day delivered to the duke of Orleans, commanding him to retire to Villars Cotterel, one of his feats, about 15 leagues from Pari, and to reccive no company there except his own famiOriter: and , two m:ro bers ba. silled.

エ5
Stronze. monfratices of the parliament teaa, both members of the parliament, and who had ditinguilhed themielves in the debate, were feized under the authority of lettres de cachet, and conveved, the firit to the cattle of $11 . \operatorname{sint}$ St Michel in Normas s, the hat to a prifon in Picardy. This act of delurifn did not fail immediately to roule the feeling. © the parizment. On the following day they wited on the king, and exprefled their altonill- meat and concern that a prince of the blood royal bad been exiled, and two of their memiers imprifoned, fer having declared in his prefence what their duty and conviences dietated, and at a time when his majetly had announced that he came to take the fenfe of the atlembly by a pharality of voices. The anfwer of the hing was referved, furbidding, and undatisactory; and tended to increale the refentment of the parliament. At the fame time, it did not prevent them from attending to the exigencies of the ttate ; and continced of the emergency, they confented to regiter the loan for 450 millions of livres, which had been the fource of this unfortunate difference. This conceffion contributed to foften the mind of the kirg, and the bentence of the tao nagiftrates was in confequence chatged from imprifonment to exile ; M. Freteau being fent to one of his country feath, and the Abbé Sabatiere to a convent of Benedictines.

The parliament, howeser, was not to be foothes by that meafure to give up the i gints agraint which they had originally remonfrated. In a petition conceived
 Gu.ers, the hatdy repoh ited the hit etvof arbit:dry whence, sal dicamacd the esaie iborerion of th pution ag timt whom they had been exert !. W: hase anealy notieed the flatowting coumbls of the

 duke of Orkans to court, who doo: at:e wetived colied. leave to retire to England; and he permiteed the return of the Abbe Sabatiere and MI. Fretean to the cripital.

The parliment, howerer, hid wot confined their demands to the liberation of thofe sentlemen; inut had ali. echoed the remmallouces of the parliament of Grenoble, and had loudly inveighed agaimt the exce.. tion of $k_{\text {thes }}$ do cachot. Thele repented remondrance, mingled with perfonal rellection, leconied mork probably the fuggeitions of the queen, and Luas wavirn once more intligated to mealure of leverity. $\mathrm{H}_{\mathrm{c}} \mathrm{J}^{\mathrm{m}}$ : ate. d`Emamenil and Muramiert, whofe boid and puintud ${ }^{\text {cer }}$ harangues had prehed mote clofely en the roval ditunty, were domed to enperience its immediate refentment. While a body of armed troups furroumded the hotel in which the prarliament were convened, Colured Degout entered the affembly, and fecured the perCons of the omovious members, who were it...matly conducted to different prifons. This new inhtanee of arbitrary violence occaioncl a rementratice from parliament, which in boldnels far evceedel all the former reprefentations of that affems!y. They declared they were nom mume lirongly comirmed, b; every procecdias, of the entire innovation which was aimed at in the contitution. "But, Sire"" adde they, " the lrench nation will never adopt the deSpotic meatires to which you are advifed, and whote effects alarm the mot faithful of your magitentes we thall wit repeat all the unfortunate circumanance. which a:tict us; we thall only reprefent to you with refpectul firmens, that the fundanental laws of the hiazdom mu/l not be trampled upon, and that frow as-
 *) iu/lice."

Language io puinted i...d decifive, and which anter. 105 ed the controlling power of the laws above the regalorti, authority, could loot full of ferioully almang the the king; and with a siew to diminih the inthence of parliament, it was determined again to convente the nutables. Accordingly, about the begiming of Min. Louis appeared in hat allembly : and atter comflaning of the excelles in which the pasliament of Paris had ; duged themfelven, and which had drama down his relactant indignation on a few of the members, he declared his relolution, ir ie: d of anmihi lating them as a body, to recal them to their duty and obedience by a ialutary roform. N. de la Moignon, as heeper of the feals, then explained his majetty's plealure to eltablihn a cour finner or fi.. preme affembly, to le compoled of princes of the blood, peers of the realm, reat oflicers of the crowr, the clergy, marelibals of France, gevertoon of peo vinces, hnights of different orcers, a dejutation of we member form evesy parlionient, and the nembers fiom the clanber of council, and to be fummered as often as the public enargency, in the royal opmion, Hould render it requilite.

If the affembly of the notables lifened in filent defercnce to the project of their fovercign, the parliameat of Pais received it with every fymptom of :avertion. Thit body itrongly protelled againft the eftablifhment of any other tribunal; and declared their final refolution sot to affig at any deliberations in the fupreme aniemuly which his majefty prepared to inflitute. A more unexpeeted martifiention occurred to the king in the oppoftion of feveral peers of the realm : thefe esprolied their regret at beholding the fundamental principles of the cotalituticn violated; and while they were lavith in the profelions of attachnent to the perion of their fovereign, concluded with apologizing for not entering on thoie functions afligned them in the plemaly court, as being inconliftent with the true interefts of bis majelly, which were infeparable from thefe of the nation.

The thime quickly fpread throughout the more diAtht provinces; at Remues in Brittany, and Greruble in Dauphine, the peop to broke out into acis of the moft daring outrage. In the latter city feveral ? undrel of the inhatitants perihed in a contict with the military ; they vet maintained their ground agamat the regulars; and the commanding officer, at the enbreaties of the fird prelident, readily withdrew his troops from a contelt into which he had entered with reluctince. The diff:ent parlienents of the kingdom at the rume tume exprellici their feelings in the molt glowing inguate ; and triongly urged the neceffity of caling together the lates general, the lawful council of the kingdem, as the onily means of refturing the public tranguillity.

Louis now phainly faw, that a complianee with the public wihes fur the re-eftablifiment of the flates general was abfolutely neeeflary, in order to avoid the calamities of a civil war, which impended upon his refafal. In that event he mult have expected to have encountered the majority of the people, animated by the exhortations and example of their magiltrates; the peers of the realm had exprefied the titrongelt difapprobation of his mealures; nor could he even depend any longer on the fupport of the prinees of his blood: but what afforded moft ferious matter of alarm was the firit lately difplayed among the military, who, during the diturbances in the provinces, had reluctantly been brought to draw their fwords agaialt their countrymen, and many of whofe ufficers fo recently engaged in eftabliihing the freedom of America, publicly declared their abhorrence of defpotifra.

It was not however, till after many a painful Rruggle that Louis could refolve to retlore an aflembly, whofe inluence mula inturally overfhadow that of the crown, un. whofe juridicition would confine within narrow Limits the boundlefs power he lad iuherited from his predeccfior. In the two preceding reigns the fates gencral had been wholly difeontinued; and though the queen regent, during the troubles which attended the miniority of Louis YIV. frequently exprefled her intenturn of calling them together, the was conflantly difiuaded by the seprefentations of Mhazin. It is probable that the prefent monarch flill flattered himWIf with the hope of being abie to allure the nemtess
$103] \mathrm{F} \mathrm{R}$ A
of that affembly to the fide of the court; and having Fiance. employed the: to ellablith fome degree of regularity in the finances, and to curb the fipitit of the parliament, that he would agaia have diminfed them to oosScuity,

Under thefe imptefions an arret was iflued in Au- $\begin{gathered}2=0 \\ 20\end{gathered}$ guit, fixing the mecting of the itates general to the frret ior firll of May in the enfung year; and every thep wasing the taken to lecure the favourable opinion of the public fites geduring the interval. New arrangements took plate in neral. the adminittration; and M. Neckar, whom the confidence of the people had long followed, was again introlueed into the management of the finances; the tenture, which by a former edict had been reffricted in part, was now entirely abolithed; every perfon accufed was athowed the affilance of couniel, and permitted to avail himfelf of ary foint of law; and it was decreed, that in future fentence of death thould not be paffed on any perfon, unlefs the party accufed thoutd be proncunced guilty by a majority at leat of three judges.

The time appointed for the convention of the flates general was now approaching; and the meanis of af iembling then formed a matter of difficult deliberation in the eabinet. The laft meeting, in 1614 , had been convened by apylieation to the bailiwick. But this mode was liable to feveral Alrong objections; the bailiwicks had been inereafed in number and jurifdiction, feveral provinees having tinee that period been united to France; and the numbers and quality of the members were no lefs an object of ferious attention: it was not till the clofe of the year, thenefure, that the propofal of M. Neckar was adopted, which fixed the number of deputies at 1000 and upwards, and ordained that the reprefentatives of the third eftate or commons thould equal in number thofe of the nobility and clergy united.

The eyes of all Europe were now turned on the ftates general; but the moment of that affembly's meeting was far from aufpicious: The minds of the French had long been agitated by various rumours; the unanimity that had been expected from the different orders of the flates was extinguilhed by the jarring pretenfions of each; and their mutual jealoufies were attributed by the fufpieions of the people to the intrigues of the court, who were fuppofed already to repent of the hafty aflent which had been extorted. A dearth that pervaded the kingdom increafed the general difeontent ; and the people, prefled by hunger, and inflamed by refentment, were ripe for revolt. The fovereign alfo, equally impatient of the obftacles he contirually encountered, could not conceal bis chagrin; while the influence of the queen in the cabinet was again ettablifhed, and was attended by the immediate removal of M. Neckar. The dilmifion of that mini-Intureo $=0$ fter, fo long the favourite of the public, was the fignaltions and of open infurrection: the Parifians afiembled in my-revolution. riads; the guards refuled to oppofe and thain their arms with the blood of their fellotv citizens; the Count d'Artois and the moft obnoxious of the nobility thought themfelves happy in eluding by llight the fury of the infurgents; and in a moment a revolution was accomplifhed, the moft remarkable perhaps of any $1 \mathrm{e}-$ curded in hiftory.

But before we proceel in our narration, and detaik

The svondenfal fpectacie which we are nove is contemplate, is that of a mild and polinted people tor ming in an intant C.nguivary and fierce; a well eflablifhed gozwment, celebrated for its dexterity and itill, overtumed alınort without a Aruggle ; a whole nation apparently uniting to deltroy every inllitution which antipuity had hallowed or education taught them to relpect; a fuperditious people treating the religion of their fathers with contempt; a long-enlaved peop.e, whole very chams had become dear $t$ - them, occuried ia their pablic cobalels in the difculfion of refined and even vitionary fchemes of freedom: in llart, 25,000,000 of perions fudlenly treading under foot every fentiment and every projadice that they themfelves had unce regarded as facred and venerable.

Like the other nations of Europe, France was anciently governed by a barbarous ariflocracy, whote different members were feebly united by the authority of a fucceffion of kings deltitute of power or influence. The nobles, within their own territories, enjoyed privileges entirely royal: they made peace and war; they cuined money; they were judges in the lall refort; thitir vaffals were their flaves, whom they brought and foid along wit' the lands; the inhabitants of cities, although freemen, were deprefled and poor, depending for protection upon fome tyrannical baron in their neighboarhood. At length, hovever, by the progre!s of the arts, the cities rofe into coniderable importance, and their inhabitants, zlong with fuch freemen of low rank as refided in the country, were confidered as entitied to a reprefentation in the fates-gemeral of the king. dom, under the appellation of tiers etat, or th:rd eflate; the ciergy and the nobles forming the two fril estates. Put the loverein, having fieedily become defortic, the mectings of the flates general were laid ahde. 'This abfolute authority, on the part of the crown, was mot acquirct, as it was in Ergland by the hout of Tuln

Fiane. dating to intemarr with the families of their profefions. The feudal fytem in it, purity was extremely fivourable to the production of reticetable qualities in the mind of thole who belonged to the erder of the nobles; but the introduction of commerce has rendered it daline equally unfarouratle to the claf of men. 1. ${ }^{\text {thend }}$ of the ancient patiardal attachment between the feudal chefain and his vatul, the mobitity had become greedy landords in the province, that they miglt appear in plendor at cunrt and in the capitah. There, luft i:s intrigue, fenfuality, and vanity, their characters became frivolous and contemptible. Such of the French roblefe, however, as remaincd in the prowinces, regaived with iedigation this degredation of their order, and lill retamed a proud fente of honour and of courage, which has always rendersi them refpectable. The order of the nobles was exempted from the paynient of tuxes, although the property of some of them was immenfe. The eltates of the prince of Conde, for example, were worth $200.2 \supset=1$. a-year, and thofe of the duke of Otleans nearly twice as much. The crown had indeed impofed fome triting taxes tipon the noblene, which, however, they in a great meafure contrived to elude.
The par. Next to the nobles, and as a privineged order poffefliament thering a licondary kind of nohility of their own, we may t.ind.
work while to abolifh them entirely till towards the France. end of the reign of Louis XV.; but they were reflo:ed as a popular meafure, at the beginning of the reign of Louis XV1.

Tixe itits etat, or commons, formed the lowell order The ecin. of the ifate in France, and they were depreffed and mis mons the ferable in the catreme. To furm a conception of their owert fituation, it is necelfary to obferve that they bore the Opprefise whole pecuniary burdens of the flate: 'They aloae burdens on were liable to taxation. An expenfive and ambitious thom. coult ; an anmy of 200,000 men in time of peace, and of twice that number in war; a confiderable marine eftablihment, public roads and works, were all fupported exciudively by the loweft of the people. To add to the evil, the revenues were ill collected. They were let out to farmers-general at a certain fum, over and above which they not only acquired immenfe fortunes to themielves, but were enabled to advance enorraous prefents to thole favourites or miltrefles of the king or the minilter, by means of whom they procured their places. 'Io raife all this money from the people, they were guilty of the cruelleft opprefion, having it in their power to obtain whatever revenue laws they pleafed, and executing them in the feverelt manner. For this laft purpefe they ke.t in pay an army of clerks, fubalterns, fouts, and fpies, amounting to 80,000 men. Thefe men were indeed deteited by the king, whom they deceived and kept in poverty ; by the people, whom they oppreffed; and by the ancient nobility, as purfe-prcud uptlarts. But the court of France could never contrive to manage without them. The peafants could be called out by the intendants of the provinces, in what they called corvées, to work upon the high roads for a certain number of days in the year, which was a fource of fevere oppreflion, as the intendant had the choice of the time and place of their employment, and was not bound to accept of any commutation in money. They were murever lubject to the nobles in a thouland ways. The nobles retained all their ancient manerial or patrimonial jurifdictions. The common peuple being anciently flares, had obtained their freedom upon different conditions. In many places they and their polterity remained bound to pay a perpetual tribute to their feudal lords. Such tributes formed a confiderable part of the revenue of many of the provincial nobles. No man could be an offfer of the army, by a late regulation, who did not produce proofs of nobility for four gencrations. The partiaments, although origisally of the tiers ctat, attempted alfo to introduce a rule that none but the nobleffe hould be admitted into their order. In fuch a fituation, it will not be accounted furpriing that the common people of France were extremely luperfitious and ignorant. They were, however, paffionately devoted to their monarch, and whatever concerned him. In :754, when Louis XV. was taken ill at Metz, the whole nation was thuly in a kind of defpair. The courier and his horie that brought the news of his recovery to Paris nere both almolt fuffocated by the embraces of the people.

We have laid that the French monarch was defpo- $1{ }^{223}$ tic. His power was fu; ported by his army, and by a power of watchful police, having in lay an irfnite hoit of jpies the king. and other fervants. In France no man was fafe. The fecrets of private families were fearcled into. Nothing

## F R A [ in ] F R A

France. was unknown to the iealous incuibtion of the police. Men were fized by li:res de cachet when they leaft expected it, and their fimilies had no means of difovering their fate. The fentence of a court of law againit a nobleman was uftally reverfed by the miniller. No hook was publifhed without the licenfe of a cenforgeneral appointed by the court, and the minifter was accountable to none but the hing. No account was given of the expenditure of the public money. Enormous gratifications and penfions were given as the reward of the molt infamous fervices. The fupreme power of the Atate was ufually lodged with a favourite

209 Splendour of the cour s.c. miltrefs, and the was fometimes a voman taken from public prolitution. This was not indeed the cale under Louis XVI. but it was neverthelefs one of the misfortunes of his life that he was far from being abfolute in his own family. Still, however, with all its fault, the French court was the moft fplendid and polihed in Europe. It was more the refort of men of talents and literature of every kind, and there they met with more ample protecticn, than anywhere elfe. The court was often jealous of their productions, but they met with the moft diftinguilhed attention from men of fortune and rank; infomuch that for a century paft the French have given the law to Europe in all queftions of tafte, of literature, and of every polite accomplifhment. The gay elegance that prevailed at court diffufed itfelf through the nation; and amidt much internal mifery, gave it to a foreigner the appearance of happinef, or at leaft of levity and vanity.

Such as it was, this government had food for ages, and might have continued, had not a concurrence of caufes contributed to its overthrow. The inferior orders of clergy, excluded from all chance of preferment, regarded their fuperiors with jealoufy and envy, and were ready to join the laity of their own rank in any popular commotion. The inferior procincial nobleffe beheld with contempt and indignation the vices and the power of the courtiers, and the higher nobility withed to diminith the power of the crown. The practifing lawyers, almoit entirely excluded from the chance of becoming judges, wihed engerly for a change of affairs, not doubting that their talents and profeflional fl:iil would render them necelary amidit ony alterations that could occur. Accordingly, they ware the firlt infruments in producing the revolution, and have been its moft active lupporters. The monied interelt wihhed eagerly for the dornial of the ancient nobility. As for the great mak of the common people, they were too ignorant, too fuperllitioully attached to old eftablifhments, and too much depreffed, to have any coaception of the nature of political liberty, or any hope ot obtaining it. We have already ftated the leading circumftances which led to the French revolution (fec $\mathrm{N}^{\circ}{ }_{1} 8_{4}, \mathbb{E c}$.) ; but there were other circumftances which contributed in an eciual degree both to its commencoment and its progrefs.

For 42 years the prinsiples of linerty had beea difeminated with eagernefs in France by fome men of great talents, as Rouffeau, Helvetius, and Raynal, to whom the celebrated Montefquieu had led the way. Belides thefe, there was in France a va? nutitule of whe were
called men of letwer, or periens who gave this account of the manner in which they fpeat their time. All thefe were deeply engaged on the fide of fome kind of political reform. The men of leters in Paris alone are faid to have amounted to 22,005 . One of the laft acts of the adminiftration of the archbillop of Thouloufe was, on the sth July 1764, to publih? a refolution of the king in comacil, inviting all his fubjects to give him their advice wrth regard to the flate of affairs. This was confdered as a concefion of an unlimited liberty of the prefs; and it is farcely poffible to furm an idea of the infinite variety of political publications which from that period diffufed among the people a difatisfaction with the order of things in which they had hitherto lived.

The eftablified religion of France had for fome time pait been gradually undermined. It had been folemnly allaulted by philofophers in various claborate performances; and men of wit, among whom Voltaire took the lead, had attacked it with the dangerous weapon of ridicule. The Roman Catholic religion is much expofed in this refpect, in confequence of the multitude of falfe miracles and legendary tales with which its hitory abounds. Without dicriminating betwist the refpectable principles on which it refts, and the fuperftitious follies by which they had been defaced, the French nation learned to laugh at the whole, and rejucted initead of reforming the religion of their fathers. Thus the firtt order in the flate had already begun to be regarded as ufelefs, and the minds of men werc prepared for important changes.

The immenfe population of the city of Paris, a. mounting to upwards of $800,=20$ fouls, rendered it an important engine in the hand of the conducturs of the revolution. An overgrown capital has always prored dangerous to a government that is or attempts to be defpotic, as appears from the hiltory of ancient Baby. lon and Rome, as well as of modern Conitantinople, of London under Charles I. and Paris under feveral of its kings.

We cannot here avoid mentioning a phyaical event, which affited not a little in producing many of the convulfions attending the revolution, a general fcarcity of grain, which occurred about that period. On Susin day the $13^{\text {th }}$ of July $\mathrm{I}_{7} \$ 8$, about nine in the morning, without any eclipfe, a dreadful darknefifuddenly overipread feveral parts of France. It was the prelude of fuch a tempett as is unexampled in the temperate climates of Europe. Wind, rain, hail, and thunder, feemed to contend in imputuofity; but the hail was the great inftrument of ruin. Inlead of the rich profpects of an early autumn, the face of nature in the fpace of an hour prefented the dreary afpect of univerfal winter. The foil was converted into a morafs, the ftanding corn beaten into the quagmire, the vines broken to pieces, the fruit trees dennolilhed, and namelted hail ly. ing in heaps like rocks of fulid ice. Even the robut forelt trces were unable to withltand the fury of the tempert. The hail was compoled of enormous, folid, and angular pieces of ice, fome of them weighing from eight to ten ounces. The country people, beaten down in the felds on their way to church, amidt this concuffion of the elements, concluded that the lat day was. arived; and farcely attempting to extricate themfeler,

## FR A $\left[\begin{array}{ll}1 i 2\end{array}\right] \quad$ F R A

themPelvec, lay defpairing and half fuffocated amidht the water and the mud, expecting the immediate difiolution of all things. The ftorm was irregula in its devaltations. While feveral rich diftriats were laid entircly wafle, fome intermedite portions of eountry were comparatively litile injured. One of 60 fquare leagues had not a ingle ear of corn or fruit of any kind left. Of the 66 parilies in the ditrict of Pontoife, 43 wee entrely defolate, ${ }^{3}$, and of the remaining 23 fome loit two-thirds and others half their harveft. The Ille of France, being the diatrict in which Paris is fituated, and the Orleannois, appear to have fufficred chiefly. The damage there, upon a moderate eftimate, amount ed to $80,000,000$ of livres, or between three and four millions tterling. Such a calamity mult at any perind have beea levarely felt; but occurring on the eve of a great polifical revolution, and amidit a generel farcity throu dinut Europe, it was peculiarly unfortunate, ind gave more embarrafiment to the governmen: than perhaps any other event whatever. Numhers of families found it neceffary to contract their mode of living for a time, and to difmifs their fervants, who were thus left dellitute of bread. Added to the public difcontent and political difienfions, it produced fuch an effect upon the people in general, that the nation feemed to have changed its character; and inItead of that levity by which it had ever been dillinguifhed, a fettled gloom now feemed fixed on every countenance.

The fpring of the year 1789 was a period of much political anxitty in France. The fuperior orders wihed to reduce the power of the crown, but were jealous of their own privileges, and determined to retain them; while the popular philofophers and others were endeavouring to render them odious, and to roufe the people to a love of freedom. Still, however, the great body of the common people remained carelefs fpectators of the ffruggle, and unconfcious of the approaching commotion. Such was their indifference, that few of them took the trouble even to attend and vote at the elections of the dequics to the fates-general. In many places, where a thouland voters were expected, not fifty came forward; but fuch of them as did appear thowed that a fred was fown which might one day tife into important fruits. In the initructions which they gave to their deputies, the Britifh conffitution was in general the model of what they wilhed their government to be. They demanded equal taxation, the abolition of lettres de cacket or arbitrary imprifonment, the refponfibility of minifters, and the extinction of the feudal privileges of the nobles; but they wihhed that the whole three orders of the ftate floould fit and vote in one houfe, well knowing that their nobility were not prepared to act the moderate part of a Britihh houfe of lords. The robles, on the contrary, although willing to renounce tune of their pecuniary privileges, and to facrifice the power of the crown, were moft decifively refolved seither to furrender their feudal prerogatives nor the , :ght of fitting in three feparate affemblies; by means at which each of the orders could cafily refift the -n'uachments of the other two. Mr Neckar has been improperly cenfured for not deciding this laft iafportant queftion previous to the meeting of the itates g'i.era! : but it couft be obferved, that the very
purpofe of calling that affembly was to overturn the unjuft privileges of the higher orders through its medium, and without any direct interpofition on the part of the minifters. Had the king pofitively decided in favour of three chambers, the nobles and the clergy would have retained all thofe ancient abufe, eftablified in their own favour, of which it was his wihh to deprive them, and the crown and its prerogatives would have been the only objects of facrifice. It was therefore thought fafer to leave the tiers etat to fight its own battle; nor was it yet imagined that the commons of France, depreffed and poor, and difperfed by fituation over a multitude of provinces, could ever unite in enterprifes dangerous to the fovereign.

France.

The flates had been fummoned to meet at Ver- Stati2 failles on the 27th of April, and moft of the deputies moned to arrived at that time; but the elections for the city meet at of Paris not being concluded, the king deferred the Viriailles, commencement of their feffions till the $4^{\text {th }}$ of May. During this period, the members, left in idlenefs, began to find out and form acquaintance with each other. Among others, a few meinbers from Brittany (Bretagne) formed themfelves into a club, into which they gradually admitted many other deputies that were found to be zealous for the popular caufe, and alfo many perfons who were not deputies. This fociety, thus originally eftablifhed at Verfailles, was called the Comité Breton; and was one day deftined, under the appellation of the Yacobin Club, to give laws to France, and to diffufe terror and alarm throughout Europe. On the other fide, the sriftocratic party eftablifhed conferences at the houfe of Madame Polignac, for the purpofe, it is faid, of uniting the nobles and the clergy.

An event occurred at this time which all parties A popular afcribed to fome malicious motive. In the populous fuburb of St Autoine, a M. Reveillon carried on a riot in the great paper manufactory. A falfe report was fpread that he intended to lower the wages of his workmen, and that he had declared bread was too good for them, and that they might fubfilt very well on potato-flour. A commotion was raifed, he was burnt in effigy, and his houfe was thereafter burnt and pillaged by the mob, who were not difperfed till the military had been called in, and much earnage enfued. The popular party afferted that the commotion had been artfully excited by the party of the queen and the Count D'Artois, to afford a pretence for bringing great bodies of the military to the neighbourhood to overawe the fate-general, or induce the king more decifively to refolve on affembling that body at Verfailles, in preference to Paris, where they and the popular minifter M. Neckar wifhed it to be held.

On the 4th of May the ftates-general affembled at The States Verfailles. They commenced bufinefs by going in a Gentral folemn procelion, preceded by the elergy, and fol- cunmence lowed by the king, according to ancient cuftom, to Vorfillle. church, to perform an act of devotion. The nobles were arrayed in a fplendid robe, and they and the higher clergy glittered in gold and jewels. The commons appeared in black, the drefs belonging to the law. The aflembly was thercafter opened by a

## F R A $[\mathrm{II} 3] \quad \mathrm{F}$ li A

each. During their firit fittings much time was fpent in unimportant debates about trifling points of form; but the firit important quellion, that neceffarily became the fubject of their difculfion, was the areification of their powers, or production of the commilions of the members, and inveftigation of their authenticity. The commons (tiers etat) laid hold of this as a pretext for opening the grand controverfy, whether the ftates-general fhould fit in one or in three feparate chambers? They fent a deputation inviting the nobles and the clergy to meet along with them in the common hall for the purpofe of serifying their nowers in one common affembly. In the chamber of the clergy 114 members voted for the performance of this ceremony in the general affembly; and 133 againft it. But in the more haughty order of the noules, the refolution for the verification in their own aliembly was carried by a majority of 188 againft 47 . 'The commons paid no regard to this. They were conJucted by bold and ikilful leaders, who difcerned the importance of the point in contelt, and retolved not to abandon it. Aware of the exigencies of the flate, they knew that the crown was nearly verging upon bankruptcy; and that fuch were the deticiencies of the revenue, that only a ihort delay was neceffary to accomplifh the abfolute diffolution of the government. They fuffered five weeks to pafs away therefore in total inactivity. During this period propofals were made on the part of the miniftry for a pacification between the three orders, and conferences were opened by commifioners from each. But no art could leduce the commons from their origin 1 purpofe, or prevail with them to enter upon the bufines of the ttate.

The nation had expected much from the allemoling of the ftates-general, and learnt the news of their inattion with no fmall degree of concern. The tur etat was naturally popular, and the fublic cenlure could not readily devolve upon that tatouritc order.

Vot. IX. Part 1.
viled their whole order, and reprelented them as a: ufelefs or pernicious body of men, whofe exittence ought not to be tolerated in a free flate. Whocves adhered to them was branded with the odions appellation of Arifocrate. The clergy, from the induence of the parih cures or parfons, lemed ready to detert their caule. They were even oppofed by a mino:ity of their own body, which derised luit-e from having at its head the duke of Orleans the first prince of the blood. Still, however, the majority of the nobles remained firm; well aware, that if they once confentrd to fit in the fame affembly, and to vose promifuouly, with the ambitious and more numerous body ot the commons, their whole order, and all its $f_{\mathrm{p}}$ lendid privileges mult peedily be overthrom.

The leaders of the cemmons faw the clanse that raving ${ }^{217}$ was taking place in the minds of ment; and they at v . Dage : length regarded the period as arrived when they ought bis pur to emerge from their inactivity, and execute the daring ane the project of feizing the legiblative authority in their egmatave country. They declared that the repreientatives of honts; the nobles and the clergy were only the deputics of partic lar inerporations whom they would allow to fit and vote along with thomfelves; but who had no title in a collective capacity to act as the legillators of France. For conducting bufneis with more facility, they appointed 25 committecs. In conferpunes of a propofal by the Abbe Sicyes, a final mefiage was fent to the privileged orders, requiring their atiendance as individuak, and intimating that the commons, as the deputies of $9^{6}$ out of every hundred of their countrymen, were about to aflune the excluive power of legillation. Nove of the nonles obeyed this fummons; hut three curés, Mellis Celve, Ballard, and lalot, prefeated their commiffions, and were received with loud acclamations. 'They were next day followed by five more, among whom were Metfrs Gregoire, Dillon, and Budinesu. After fime de'sate concerning the appella,if whith the\% onvit to :flume, the commons, with P

Frame. Thot foech from the throne, in which the hing congratulated himfelf on thus meeting his people atfembled; alluded to the national debt, and the taves, which were feverely felt becaule unequally levied; he took notice of the general difcontent and fipitit of imovation which prevailed, but declared his confidence in the wifdom of the affembly for remedying every evil. ". May an happy union (added he) reign in this aflembly; and may this epocha become ever memorable for the happinets and profperity of the country. It is the wihh of my beart ; it is the mo:t ardent defire of my prayers; it is, in thort, the price which I expect from the fincerity of my intentions and my lore for my people."
M. Barretin, the keeper of the feale, nest addreffed the afembly in a congratulatory and uninteretting feech. He was followed by the popular minifter M. Nechar, who fpoke for three hours. Though much applauded on account of the clear financial details which his fpeech contained, he encountered a certain degree of cenfure from all parties, on account of the cautious ambiguity which he obferved with regard to the tuture proceedings of the flates-general.

Next day the three orders affembled feparately. The deputies of the tiers etat amounted to 600 in number, and thofe of the nobles and clergy to 300

Moreover, isom the trat petiod of ticir an nuan is the commons made every efiont to atument their uss natural popularity. They admitted all perfons promikcooutly into the galkeice, and cocti into the body of their hall. Nu rellaint was attempted to be lat upon the moll whement marh of popular applautc or cenfure. Lifts of the voten wame were publicl, taken and fent to $\mathrm{P}_{\text {mis }}$ upon every remotable ocolfion; and the membe:s luddenly iuund themfeles become, according to their political lentiment, the of, jects of general execration or applatio. The new and bold notions of linerty that were dally athenced by the leaders of the tiers tat were reccised witl. acclamation by their hearers. The capital became intereited in the iflue of every debate; and the political fervor was eagorly imbibed by the nation with that vivacity which is fo peculiar in the French. The commons arcufed the nobles of obtlinately inpeding the bufinefs of the tlate, by refufing to verivy their powers in one common aftembly. The necutation was fwallowed by the multitude, who law ne. or were unwilling to lee, that the attack was mad by their own fatourite order. In the mean time the nobles became rapidly more and more unpopular. Their perfons were infulted, new publications daily came forth, and were greedily bousht up, which re-

'The
affembly, after wandering about ia Cear 11 of a phace France. of meeting, at length entered the church of St Loun, and were immediately ioined by the majurity of the 1 , 9 . $_{\text {and }}$ clergy, with their prenident, the archbimop of Vieme, 222 at their head. Two robles of Dauphiné, the mar puis The Aliemde Blaçon and the count $\mathrm{d}^{*}$ Aqoult, pretented their cam-in the miflions at the fame time. Encouraged by thele events, church of and by the applaules of farrounding multitudes, the St Louis. allembly now expected with fromefs the meafures about to be adopted.

The royal leffion was held in the mont folendid form, Difcourfe of but altogether in the thyle of the ancient defpotitmo the king Soldiers furrounded the hall. The two fuperior orders were leated, while the reprefentatives of the people, left itanding a fill hour in the rain, were in no humour, when at lat admitted, to receive with much complacency the commands of their fovereign. The king read a difcourie, in which he declared null and roid the rcholutions of the 1 -th, but at the fame time prefented the plan of a contitution tor France. It contained many good and patriutic principles, but preierved the dininction of onders, and the exercite of lettres de cachet; it faid nothing about any active thare in the le. gillative power to be poticuled by the itates-genera', and was filent both about the retponibility of misaters ant the liberty of the preis. The king concluded by commanding the deputics immediately to retire, and to atfemble again on the following day. He then withdrew, and was followed by all the nobles and a part of the clerg. The commons remained in gloomy filence on their feats. It was interrup" 1 by the grand mater of ill received the ceremonie, who reminded the prefident of the in-by the tentions of the king. Intartly the vehement count commoncs de Mirabeau, itarting trom his fort, exvivimed with in. dignation, "The commons of Fratice have determived to debate. We have head the intention that have been fuggelte. to the king; and you, who cannu: be his agent with the flates-neneral, you who have hros neither feat nor voi-e, nor a right to lpal, are not the perion to remind as of his Ipeceh. (io tell yout maller, that we are here by the poser of the pzople. and that nothing itall expel us but the bayoner." I applaule of the aflem 3 le fended the enthulia m of rite orator, anst the matter of the cermonies withdrew in tilence.
M. Carmus then rofe ; and in a solent fpeech indig- Des as a a nantly digmatized the roval fetion by the obnoxious ter the appellation of a bed of ju/t.ce; he concluded hy moving ting's dothat the afiembly thould declave their ungualified adne-partu: rence to their former decrecs. This motion was followed by arotiser, pronouncing the perton of the deputies inviolable. Buth were fugported by Mults Petion, Barnave, Glai/en, the Abbes Gregoire, Sieves, and many others, and were unamouly decreed. Tine allembly theretore continued their fitting, in the ual form. On the following day the majoity of the ciergy attended as members; and on the 2 zth the duke oi Orleans, along with 49 of the deputies helonging to the order of nobles, poined them alio. The remairing nobles, as well as the finall minority of the ciergy, nuw found themlelves awkwardly fituatel. Whether on this account, or becaute their leaders had by this time formed a plan for carrying tleir point not by peaceable means but by the aid of a mihiary force, the king, on the $27 \mathrm{t}^{\prime}$, invited hy a frething lewer both orders

feditous $p^{13} h^{\prime} \mathrm{d}$ tions. fions of their folitical itate. Esery effort was moreover made to difurgmize the government, and produce a dillike to the ancient order of things. The prefs poured forth innumerable public.aitos, filled with new and feucing, though generally impractic sole, theories of liberty. Theis wee ditributed grats among the lath of the peonte of Paris, and dippelied in the came nanner through the provinces. Phiiip duke of Orleans frefumptive heir to the crom, failing the chiloren and brothers of the king) in with good reafon believed to have fupplied this expence out of his more than royai revenucy. In the garden of the Palais Royal it Pais, which belonged to him, an immente multitude was dany anex.bled, hilering from morting to night to otators who ceicanted upon the moft violent fu'gects of popular politics. Many of thefe orators were finpered to be in his pay. It was even beliered that his money found its way into the pockets of fome of the mout ditinguithed leades in the netional affemL:

Eut the government was, if pofilie, fit! mare dangeroun't aflawited by the methods now wemertily wed to feduce the military. Every offer of the lisencis amm belonged to the order of the: notles; and from that quarter, therefore. it might have becn immened that there was littie danger. But this vay circurn. nance berame the mean of diforcanizing that geont engine of deporifin. fis the iblders coull nat ansid imbibing fome of the new opinion, their own oTrorn became the inat objects of their jealouly; che cinaty in coniequence of that impolitic ediot oi Iomin XVI. which required every ofizer to prodace proos's of town cegrees of nobility: and thus infuted, by ammorlly excludine the prisate men form prontion. Pathes with a wise to what might hapeen, the intiru tion th the depaties of the sers ciat hal recommended an in ceale of the toy of the foldiern. Am now at intion - very art was wied to grin them to the populan chate. They nore corducied to the Palais Royat, and wew there cartene and nattered by the popuince, whit they lintered to the pupular harargues. The ar anow

fire on the mab in a riot. Sume of then wore on the it
zoth reported to be in contremen tor this fence, 3oth reported to be ill com ennent for this wenke, a
crowd intantly coliccted, and retcu. grons that were broughe to fig yre's the tumblt giounding their aras. A depuratum of the citizens folinited of the afiembly the patum of the pritoners. The at fembly applied to the king, who prowed them ac cordingly.

All thefe events, together with the wnuturw hate The 0 , of the capital, which was daily increating, mad it re- out. cellary for the king to ca!l out the military force to reftore, if poffible, the public peace. That his inter.tions were pure, the then !late of affars will permit no man but a democrate to doubt; but the ariltocracs. with the Count d'Artois at their head, were bringing forward other neafures, which ultimately contibuted to the ruin of themelves, the king, and the kingdom. Crowds of foldiers were collected from all parts of the kingdom around Paris and Veriailles. It was orferved, that theie contited chiefly of foreign merce. naties. Camps were traced oui. Marhal Broglic, a tried veteran, was fent for and placed at the head oi the army. The king was fuppoied to have entirely yielded to new countels, and every thing bore the appearance of a defperate effort to rellore the energy of the ancient government. This is the molt impo: tant period of the French revolution ; yet the trecits deigns of the leading actors have never been clar! undertood. It was rumoured at the time, that Pat: was to be fubuued by a fiege and bombardnent ; the: the affembly was to be diffolved, and its leaders put to death. Thefe are incredible exaccecations; bu: the crins of French liberty was univerally regarded as at hand, and alfo the exifence of the wational atfembly as an independent body; or at leat uan any other footing than that propofed b: the king on the 23 ! of June.

An abie and eloquent adrees to the hing ag:imat the the affem anemblage of forcign troops in their neighbourhood was brough forwand by Mirdieau, and voted hy the the thog to aflembly. The hivg properly replied, that the itate of in an, the capial was the cauic ut membling the troops, and which is
 fons. "We will re: her remone (evchainrd Mirabau) to Nuyons or to Sombin: : "e will nat flace ourfetive hetween two hothe amic, that which is becies.a Pari, and that which may tall upon us though lianders or Allace; we have not affal fermilion to ran anay from the troops; we have defired that the $\because$ on ${ }^{2}$, homild tee romoved from the capital."

Tinity-five thoufand men were now fation in the winhtourhood of Paris and Verlailes. Ti.e puite we: uccupicd which commancat the city, :nd cons were marked out for a greater furfee. The Cue a Artuis and his party resarded their plans on 1ipe for en... tion; and M. Nehat received a heter from the hing, requing him wait the kingdom in at hous. biy in con. 1equence. a wore coolly told, that the King was the bel judge of the mole of cmploying the troops, and that the prefence of the unembly was necefiry at Vcrfailles. From a fovereign who doubtefs recolleted the pruceedinss of the long parliament of England, a different reply could not in reafon be expected. On receiring it, however, it was intantly decreed, on the motion of the marquis de la Fayette, that the late minill ry had corricil with then the confidence of the affambly; that the troups oushe to be remowd; that the minitiy are and fhall be refponible to the people fur their condut ; that the affembly perfined in all its former decrees; and that as it hid taken the public debt under the protestion of the nation, no power in France was entitled to pronounce the infamous word bankrupicy.

The city of Paris was thrown into deep confternaan hec by the news of M. Neckar's retreat. His tuit 1.ar*s $5:-$ treat.

235
Cruety of the Prince De Lainbefq. and that of the duke d'Orleans were dreiled in mourning, ant carried through the ilreets. The royal Allemand, a German regiment, broke in pieces the buts, and difperfed the populace. The prince De Lambeff, grasd ecuyer of France, was ordered to advance with his regimert of cavalry, and take pott at the Thuilleries. Being a man of a violent temper, and enraged by the appearances of difapprobation which were vifible around him, he furioully cut down with his fword a poor oll, minn who was walking peaceably in the gardens. The confequences of this at of inhumanity were wheli as mij; ht have been expected; a thout of execrative inluntly arofe; the cry to arms was heard; the military were afluyted on ali fides; the French gurds foined their countrymen, and compelled the Germans, oveepowcred by numbers, and untipported by the rell of the arny, to retire.

All order was now at an end, and as aight approached an univerfal terror diffufed itfeli through the city. Baids of robbers were collecting; and from them or
from the foreign foldiery a general pillage was expeted. The niglit paffel aray in conflernation and tumult. It was found in the morning that the hotpital of St Lazate was alrealy plundiered. The elarm belis were rung; the citizers affentled at the Hotel de Yiile, and adoptod a propofal that was there made, of enrolling themrelves as a militia for general defence, under the appel1.tion of the nattional $\xi_{\text {nerd }}$. This day and the fucceeding uight were fpent in tolerable quictnefs, without 4ty :atempt on the part of the arny. On the moraing of the memurable $14^{\text {th }}$ h of July, it was difcovered that the troops eacamped in the Chaunps Elifécs had anoved off, and an immediate aflault was expected. the national guard now announted to 150,000 men; but they were in gereral delitute of arms. They had affumed a green cochade; but on recolecting that ulis was the livery of the Count d'Artois, they adopted tone of red, blue, and white. M. de la Salle was nazned commander in chicf, oficers were chofen, and desachments fent around in queft of arms. In the Hotel des Invalides upwards of 33,000 fland of arms were found, along with 25 pieces of cannon; a variety of weapons was alfo procured from the garde meatle cie la couronne, and from the thops of armourers, cut3ers, , \& c .
The culebrated fortercf of the Baflite was an object
of much jeatury to the Panifans. At 11 w'cluck in the mozning, M. de la Rofiere, at the head of a numerous defutition, naited epon M. de Launay the governor, who promiled, along with the otlicers of his garifon, that they would not fire upon the city unlefs the Lafthey flould be attacked. But a report was foon fpreaded;
throuth Paris, that M. ec Launay had, in a thort time thereafter, admitted into the foitrefs a mu'titude of perfons, and then teacheroutly mafiacred them. The caule of this picce of perfidy has never been explained. The fact itielf has been denied; but it was attelled at the time by the duke of Dorft, the Britith ambaffador at the court of France. '1le elfect of the report was, that a fudden refolution was adopted of aflaulting the Baftile; an immenfe and furious multitude rulhed into its outer, and foon forced their way into it, inner, courts, where they received and returned a fevere firc for the fpace of an hour. Ite French guards, who were now embedied into the national guand, conducted the attack with fxill and coolnefs: they dragged three waggens loaded with diraw to the foot of the walls, and there fet them on fire; the fmoke of thefe broke the aim of the garrifon, while it gave no dillurbance to the more dillant affailants. The befieging multitude preffed the attack with incredible obitinacy and vigour for the fpace of four hours; the garriton was in confufion; lie officers lerved the cannon in perfon, and fired their mukkets in the ranks; the governor, in defpair, thrice attempted to blow up the fortrefs. A capitulation, when at laft fought, was refufed to the ${ }_{\text {And fur- }}^{238}$ garrifon, and an unconditional furrender took place. rndered The governor, and M. de Lofine Salbrai his major, auncondigentleman of diftinguilhed humanity and honour, be-tionally. came victims of popular fury in lpite of every effort that could be made for their protection; but the French guards fucceeded in procuring the lafity of the garrifon. Only feven prifoners were found in the Baflile. A guard was placed in it, and the keys were lent to the celebrated M. Brifot de Wartille, who a few years before had inhabited one of its caverns.

The remaining part of this eventful day was fpent at Paris in a nisture of triumph and alarm. In the pocket of the governor of the Baftile a letter was found, encouraging him to refilance by the promife of fpeedy fuccours, written by M. de Fleflelles, the prevot de marchands, or chief city magill rate, who had pretended to be a mott zealous patriot. This piece of treathery was punimed by inflant death; and his bloody bead was carried through the city on a pole, along with that of M. de Launay. At the approach of night a body of troops advanced towards the city, at the Barriere d'Enfer. The new national guard hurried thither, preceded by a train of artillery, and the troops withdrew upon the firtt fire: barricadocs were everywhere formed, the alarm-bells were rung, and a general illumination continued during the whole of this night of confufion.

In the mean time, it was obvious that the new mini- a new miftry were entering upon a diflicult feene of action, nilfry apwhere one falle flep might lead to ruin, and where pointed. their own plan of conduct ought to be maturely digetted. Marthal Broglio was made mininter of war, the baron de Breteuil prefident of finance, M. de la Gale. ziere comptroller-general, M. de la Porte intendant of the war department, and M. Foulon intendant of the navy;

under the Count d＇Artois，and the other leadere of ite arithocracy．To thefe leaders there didnoteven re：n in a choice of dificultien；no refiurce was Bet but that of overawing by militay power the nati col anforbly and the carital，and of rising the deforrtic mature of a national bahruptcy，which the ceurt lad at formetly carel to encounter，and to arod whid it hal conoh－ ed the fatess rencral．N，trace temains，however，of ay attempt to put this criminal，but latt refurce，in cecution．The wening ater the departure of $M$ ． Neckar was fent by the court of Verfailles in feakias and joy，as if a victory had been gained．The courtie： of bith fexes went roand amonss the foldiesy，ftriving to fecure their fidelity by carelice，largelies，and every lpecies of thatering attention．The miniltry not only trited to fupport the Prance de Lambefiq in the puit which he had been fent to uccure，hut they fuffered the whole of the $1 \mathrm{~g}^{\text {th }}$ to pafs in indecition，while the capital was in a date of rebellion，while an army was formally mutering within its walls，and the names of the principal nobility wete put up in lifts of proferip tions．Tley received the news of the capture of the Batile with coatation and dime＇s，which were increa－ led，if poliible，by information given by Marhal Boos－ lio，that the troops refufed to act againt Patis or the national afferbly．In this perplevity they adupted the miteratle device of concealing from the king the itite of fublic affirs；and that unforiunate prince was thus pemaps the only perion out of milhons around him wioo remained ignorat of the convulions in which his coun－ try was involved．

At length，at midnizht，the Dike de Liancout forced his way i to the kirs＇，aporment，and told him of the revo＇t of his capital，of his army，and of the fir－ render of the furtref of the Bullilc．The Count d＊Ar tois，who was precit，fill attempted to retain the mo－ narch u：der his fatal delufon；1，ut the Duke de Li：ta－ court turni：g round，evclaimed，＂As for you，Sir， your life can unly be faved by infant flight；I have feen with horror your name in the bloody lint of the proforibed．＂Accordingly the count，with the mem－ ters of his thort－ived adminitration and their adhe－ rents，fled to the frontiers．And thas an emigration com－ menced．the fource of that terrible contelt which has covered Europe with bloodlied and mourning．This minillsy had，no doubt，many dificulties to contend againit；but an accurate atiention to their conduet ex－ cites a fulpicion which，wlile it exculpates them from many intended crimes thit have becn laid to their charge，at the lane time des little honour to their ta－ lents．It is this，that they hal come into office without having formed iny clear plan of conduct；that they were men acting without dection and at rimdom，and confequently became the tpurt of thufe events which they wanted fkill and wirour to direct or controul．By their introduction into oflice，and their mifonduct while in it，the royal authority fell proilrate before the popu－ lar party in the nationsl affembly．The nobles and the clergy fill remained，but confounded in one añern－ Dy with the mere momerous order of the tiers etar；and no Jonger ralling round a throne that was too fecble to afford proteaion，they foon yielded to that fierce and leveling fpirit of democracy that now rofe around them．

I7 89. 24.4 Fate ot A: toulon, and Ber. :thers.
I. .... Hia charater, it may wrl] be imagined, was caticmely unpopular; for he is faid to have afinted, that he would " make the people of Paris eat hay:" In had attiod to the country, but was feized by his usn samals, and brouglat on Paris vith a tundle of hay tied to his back. In fite of every effort made by MI. NI. Bailly and Fqette to proure him a fair trial at leat?, lee was carried to the Pidee de Greve, and hanged at a limp-ion by the earaged multitude. His ion-in-law M. Beathier, attentting to deferd himfelf againt a himilar fate, fell, coreted with wounds. Their keads were canricd ronnd on poiss; and thas the populace became lalituated to the fight of blood and murder : they were even taught by popular fongs to glory in fuch actions, and particularly by the well known fong Cas:
In cenfequence of in insitation from the king, M. Neckar seturned to France. He was received by the affembly with great applaufe, and in Paris with infinite folemnity and triumph. He here, however, committed a political error that made fome noife. In deploring the late exceffes and murders, and taking notice of the arrell of M. Bezenval, an officer of the Swifs suards, he requelted of the electors at the Hotel de Ville, in a folemn harangue, that the paft fhould be forgotten; that proferiptions thould ceafe, and a general atnmety be proclained. Ia a moment of enthufiafm this was agreed to, and the electors decreed what unTueltionably exceeded their powers. The difricts of Paris were intlantly in commotion ; the electors alarmed, declared that they only meant that " henccforth the psople would punifh no man but according to law ;" and at the fame time, to prove that they themfelves were free frum ambition, they formally renounced all their ovn powers. The affembly took up the queftion. Lally Tolendal, Mcunier, Clermont Tonnerre, Garat junior, and otherc, declared that no perfon ought to be arrefted without a formal accufation; while Mirabcau, Robefpierre, Barnave, and Gleizen, alleged, on the contrary, that the people were entitled to lay hold of any man who had publicly appeared at the lirad of their enemies. The debate ended, by admitting the explanatien of the clectors, and by a declaration Chat it was the duty of the affembly to fice jutice exechted in all cafes.

The commotions and enthufiafm of the capital were fipecdily communicated to the provinces. In every qarter the people feized upon all the arms that could be found, and the military uniform! y refufed to act againt them. Many asts of outrage were committed in Brittany, at Straftourg, in the Lionnois, and elfewhere, in which the nobility were the fuferers. The mi.chief, that occurred were tifually magnitied at a diftance: but thet vers circumitance was an additional cvil. For cample : It was flated in the National Af. feably that M. de Mefmay, lord of Quincer, invited a rumber of patricts, among whom were the officers of a neighbouring garrifon, to a fplendid entertainment at li, houfe, to culebrate the happy union of the three netre That in t!e nidit of the fealt the mather of the lou'e conmived to with! aw unnoticed, and to fet fire to a trim pecvioufy : id, which communicated with a santity of gunfow'er in the cellars, in conferuence of which the whole company, by a fudden explofion, 6 te b!ers intu the air. it va, found on inquiry,

## F R A

that there nas not one word of truth in the whole flory. Fiance. Bu* before this inquiry could be made, all 「rance l:ad refounded with accounts of the pretended bloody $1=89$. tragedy; and the whole nobility of the kingdom fuffered in a lels or greater degree, from the frejudices evcited by this unhappy report, the origin of which hai never been well explained. It woud be vain to thate all the idle rumours to which at this time the blind credu lity of the multitude gave curreney. At whe time, the Aritocrates were cutting down the green corn ; at another time they were burying fluur in conmon fovers, or cafting loaves into the Seine. One report was no fooner proved to be falle than another arole, and thee whole nation was agitated by fufpicion and alarm. The National Affembly were engaged in framing their celcbrated declaration of the rights of man, which was to form the bafis of the new conktution, when the aldming accounts, received from all quarters, of the flate of anarchy into which the kingdom was falling, ot liged them fuddenly to turn their attention to objuct, of practical neceflity. The privileged orders found themfelves become the objects of univerfal jealouty and hatred ; and that fomething mult initantly be done to five their families and property, which were menaced on every fide with perfecution and pillage. Regarding the popular torrent as now become irrefitible, to fave fumething they refolved to facrifice a part.

On the afternoon fitting of the $4^{\text {th }}$ of Augult, the Nofount de Vifcount de Noailles, feconded by the Duke $\mathrm{d}^{\prime}$ Aguil- Noailles lon, opened one of the molt important fcenes in the and guillon French Revolution, or in the hiftory of any country. propofe Thele noblemen flated, that the true canfe of the com-that motions which convulfed the kingdom exilted in the mifery of the people, who groaned under the double oppreffion of public contributions and of feudal fervices. "For three months (faid M. de Noailles) the people have beheld us engaged in verbal difputes, while their own attention and their wifhes are directed only to things. What is the confequance? They are armed to reclaim their rights, and they fee no profect of obtaining them but ly force." He therefore propofed to do jultice as the thortelt way of reftoring tranquillity, and for that purpofe to dccree, that henceforth cuery tax thould be impofed in proportion to the wealh ot the contributors, and that no order of the ftate thould bctoporexempted fiom the payment of public burdetis; that wealeh o: foudal claims hould be redeemed at a fair valuation; ;ie contio but that fuch claims as confifted of perfonal ferrices on betors. the part of the vaffil hould be abolifhed without conspenfation, as contrary to the imprefcriptible rights of man. The extenive polififions of the noblemen who made thefe propolsh added mu h lutre to the difinterelted facrifice which they afforded. Their fpectics were received with the mont enthufiaftic applaufes by the Affembly and the galleries, and their propofals were decreed by acclamation without a vote. No nation is to much led by the influeace of fudden emotions as the French. The patriotic contagion now futad falt through every breatt, and a contelt of generolity enfued. The horeditary juridictions foneficd by the nobles within their own territories were neyt facrificed. All places and penfions granted by the court were fuppreficd, unlefs grarited as the reward of merit or of actua! forvices. The game law, which condemned the lawe gamehatbandman, undtr fevere penalties, to leave his proper-aboinhed.

1789.
w... fucediity to burff forth ia a bloody tempett.-In the preent cafe, the people of Paris became molt eagerly interated. Rumours of plots nere fpread through the comary, and a new flom was obvioufly gathering, when the queftion was thus got quit of. M. Mounier remarked, that the extecutive power could poffets no negstive againft the decrees of the prefent alfembly, which had been nominated by he nition with fuprene powers for the exprefs purnd of framing a conflitution, which was to remain binding over all orders of men in the flate; and with regard to future legillatures, the king declated by a meflage, that he withed to poffets wio more than a fufpon/ive vito. It is remarkable that the porular Mirabeau concluded a feeech in favour of the abfolute veto of the crown with thefe words, "That it would be better to live in Conftantinople -han in France, if laws could be made without the soval fanction." This political adventurer is, however, acculed of having taken care to circulate in Paris a report that he had oppofed the zeto with all his influence; and to give credit to the ftory, be is laid to have quitted the affembly jult before the divifion, that his vote might not appear on record againit it.

The month of Augult was fpent in the debates ahout the veto; and in the begimning of September a new

State of
partu- 1 :
Paris. conftitutional queftion was prefented to the afiembly by one of its numerous committees. This was, Whether the legiftative body ought to configt of one or of two cha:nbers? Mounier, Lally Tollendal, Clermont Tonnerre, and others, who were zealous lovers of freedom upon what were then accounted moderate principles, fupported eagerly the idea of effablifaing two independent chambers in imitation of the Britiih conflitution; but they were deferted both by the democratic and ariftocratic parties. The firft of thefe regarded an upper houfe or fenate as a refuge for the old itrittocracy, or as the cradle of a new one; while the higher nobles and clergy feared left fuch an arrangement might prevent the future re-eitablifhment of the ancient divifion into three orders. Of 1000 members who roted, only 89 fupported the propofal for dividing the legiflature into two chambers.

Soon after this, the king gave his fanction to the important decrees of the $4^{\text {th }}$ of Auguft, but not without fome hefitation, and exprefling doubts of the wifdom of fome of them in a letter to the affembly. At the fame time the inviglability of the perfon of the monarch was decreed, the indivifibility of the throne, and its hereditary defcent from male to male in the reigning family.-But we thall not here attempt to enter into a detail of the various articles of the new conftitution as connected with the circumflances under which they became the fuhject of debate. We thall only flate thofe more remarkable circumftances which tend to afcertain the peculiar changes which the fentiments of the nation underwent in the progrefs of a revolution the moft remarkable that occurs in human hitory.

In confequence of the debates upon the quetlions of the veto and the two chambers, the minds of parties had become much irritated. Paris wore the fane threatening afpect that it had done in the months of June and of luly preceding; and every thing feemed tending towards an important crifis. The ariftocratic party accufed their antagonifts of a defign to excite new infurrections; and the charere was retorted, by cir-
culating a report that a , lot or conveying the king to Metz was already ripe for execution.

From the period of the defection of the French guards, who wore now in the pay of the capital, the guatds, who were now in the pay of the capital, the Confequenthe militia or national guard of Verfailies, together $\quad 1.1$ jeawith the reginent of the gardis du corps, which was loufies. campofed eatirely of gentlemen. Upon the circulation of the repert of the intended fight of the king, the Freach guards began to wilh to be rettored to their ancient employment of attending his penion, for the purpofe of preventing any attempt of this nature. This idea was eagerly cherithed by the capital; and, in fpite of every effort ufed by M. de la Foyette, the obvious appearance of approaching difturbances could not be prevented. The popular party faw the advantages which they would derive from placing the affemtly and the king in the midit of that tusbulent metropolis which had given birth to the revolution, and upon the attachnaent of which they could mott fecurely depend. Every encouragement was therefore given by the moft aclive leaders of what was now called the Democratic party to the project of eilablithing the court at Paris. 'The miniltry were under no fmall degree of alarm ; and the count d'Eilaing, who commanded the national guard of Verfailles, requefted the aid of an alditional regiment. The regiment of Flanders was accordingly fent for: its arrival caufed no fimall desree of anviety; and every effort was initantly made to gain over both officers and foldiers to the popular caufe.

On the firt of October the garde du corps, probably for the purpofe of ingratiating themflves with the newly arrived regiment, and perhaps to attach them more iteadily to the royal caufe, invited the officers of the regiment of Flanders to a public entertainment. Several officers of the national guard, and others of the military, were invited. The entertainment was given in the opera houfe adjoining to the palace; feveral loyal toafts were drank: but it is afferted, that when the favourite popular toalt The Nation was given, it was rejected by the gardes du corps. In ordinary cafes, fuch a tritling circumflance as this, or even any other of the tranfactions of a night of feftivity, would juftly be regarded as unworthy of notice in recording the more remarkable events in the hiftory of a great nation; but fuch was now the fingular flate of affairs, that the moft trivial occurrences were inftrumental, by their combination, in the production of important confequences. The queen, having feen from a window of the palace the gaicty which prevailed among the military, prevailed with the king, who was juit returned from hunting, to vilit them along with herfelf and the dauphin. Their fudden appearance in the faloon kindled in an inflant the ancient enthutiafm of French loyalty. The grenadicrs of the regiment of Flanders along with the Swiiz chaffeurs, had been admitted to the deffert; and they, as well as their ollicers, drank the health of the King, Queen, and Dauphin, with their fwords drawn. The royal family having bowed with politenefs to the company, retired.-Of all nations, the French are mof liable to the influence of fidden impreffions: the mulic played the fasourite air, O Ricard! O mon Roi! l'uniters t'abandonne," O Richard! O my king ! the world abandons thec." In the eagernefo of
loyalty,

Their aritocratic antaguniti have lince ailerted, that the famine was indeed artificial; but that it was created by a portion of the violent party in the national aniembly, which was then denominated the Cahal, whofe object was to excite commotions as the means of procuring an opportunity of fetting the duhe nf Orleans at the head of the itate, eifincr as regent, or in fome other form. To this lat party Mirabean is fid to have belonged.

For four days no notice was taken in the affembly of what had palled at the entertainment given by the garles du corps. On the 5 th of Oetober M. Petion mentioned it for the frit time, and a viclent debate enfied; during which Mirabeau rofic and exclainued, "Declare that the king's perfon alune is facred, and I myfelf will bring forward an impeachment;" thereby alluding to the conduct of the queen. While this debate was proceeding at Vertailles, the city of Paric wis in cummotion. A valt multitude of women of the losent rank, with fome men in women's clothe, had ahembled at the Hotel de Ville, and were calling aloud for arms and bread. They refolved to proceed intantiy to Verfailies to demand bread from the hing and from the national ailmbly. La Fryette oppoied them in vain : for his own foldiers refued to turn their bayonets againt the women. Upon this one Stanillaus Maillard. who had diringuinhed himielf at the taking of the Baftile, offered himeif as a leader to the indurgents. He had the addrefs to prevail with them to lay ande fuch arms as they had procured; and he fet out for Verfailes aboct noun with as much urder among his ful. lowes as could well be expected from fach :an himbblage. ried prionners to Pa ris. moh. ' Two gentlomen wore felected from his body guard, and, with all the parade of an exccution, beheaded in the court of his palace. Their heads were ftuck $u_{\text {pon }}$ ipears, and les the proceffion; whill the royal captives who followed in the train, and beheld this fectacle, were conducted fo flowly, that a thort journey of twelve miles was protracted to fix hours. The king, the queen, and their children, were lodged in the old palace of the Louvre, while Monfieur went to relide at the Luxemburg. The city was illuminated, and the evening fpent in triumph by the Parifians.

The removal of the king to Paris was regarded as a triumph by the popular party. The higher order of nobles confidered it as completely ruinous to their hopes; and even many men of talents, fuch as Mounier and Lally Tollendal, whom we cannot avoid regarding as friends to the popular caufe in its outfet, now regarded every profpect of attaining a happy conftitutional freedom as at an end, as the national reprefentatives muit be for ever expofed to the infults, and overawed by the influence, of a turbulent capital. Many members of the affembly took refuge in foreign countries, and ufed every effort to excite the other nations of Europe to hotility againit France. As the duke of Orleans had been regarded as a chief agent in promoting the late diffurbances, the marquis de la Fayette waited upon him, and indifted upon his leaving the kingdom for a time. The duke was overawed, and, on pretence of rablic bufinefs, went to England, where he remained 207 for feveral months.
The ifiten- On the $19^{\text {th }}$ of Otober, the National Affembly biy inlds held its firlt feffion in Paris. The king was clofely its inft fef. fuen ot Paguarded in his own palace ; and no apparent oppofition now llood in the way to prevent the popular party from giving to their country fuch a conflitution as they might judge expedient. Much, however, was yet to be done, and many dificulties remained, refulting from the halits of men educated under a very different order of things. Two days after the Affembly came to Paris, a baker was publicly exccuted by the mob, upon a falle necufation of having concealed a quantity of bread.White the Afcmbly was at a diftance, events of this nature had been little attended to, and the leading party avoited attempting to check thefe ebullitions of popular siolence, from which they had derived fo much advantage ; but that party was now all powerful, and to flagrant an offence committed againf the law was regardc.l as an infult upon the fovereignty of the National Af mbly. Two leaders of the mob were therefore tried an!! publicly esecuted, and a fevere law was I afed, of the nature of the Britilh riot act, authorifing the magitrates to act by military force againft any multitude of perions that thould refufe to difperfe. "Thus the peace of the capital was fecured for feveral months; Lut in the country at ! erge no fmall degree of anxiety and troule itill fublifted. The fame fufpicious temper whech had prevailed at Paris agitated the provinces with the dread of plots and monopolies of grain. Add to this, that the noblefle in the country were by no means fatisfied with the liberality with which their reprefentatives had on the $4^{\text {th }}$ of Auguit voted away their privileges and their propetty. 'This produced violent jealoufies betreen the peafants and their lords,
and gradudlly conveyed to every corner of the kingdom Fiance. the political ferment which had commenced at Paris.

The National Aflembly being now, however, in to- 1789. lerable fecurity, proceeded in the arduous attempt of forming a free conftitution for the great empire of The kingFrance. The Abbé Sieyes prefented a plan for ded into dividing the kingdom into 83 departments, of about $\$_{3}$ depart324 fquare leagues, and of each department into feve-menrs. ral diflricts, and each diftrict was fubdivided into cantons of four §quare leagues in extent. Thus the whole of the ancient divifions of the kingdom into governments, generalities, and bailiwicks, was in an inftant obliterated. An attempt was alfo made to fimplify in an equal degree the relative fituation of individuals in civil life, by a decree which put an end to all diftinction of orders and immunities, fo far as any privilege whatever was concerned. At the fame time, a bold and molt important meafure was adopted, which has fince proved the organ of thofe terrible efforts which France has been enabled to make againlt the relt of Europe. This The church was the confifcation of the whole of the lands belong- lands coning to the church, for the purpofe of fupplying the fifcated. exigencies of the flate. In this tranfaction, all regard to juitice was thrown atide. The lands of the church were as certainly the property of the then poffeffors of them as any entailed eltate among us is the property of him who occupies it. The ftate may have had a right to appropriate to itfelf the church lands upon the death of the incumbents ; but it might with equal juftice, and perhaps greater propriety, have feized the enormous revenues of the duke of Orleans, as have confifcated a fingle acre belonging to the moft ufelefs abbot without his own confent. This nefarious meafure was propofed by the bihop of Autun, M. Talleyrand Perigord, a man of no religion, who had been promoted to the bench in a moft irregular manner to ferve this very purpofe. The mode in which this property was to be expended was by iffuing affignments (a/fignats) upon it ; which alingmments were to be received by the flate for the parment of taxes, or for the purchafe of church lands when fet up to fale. A provifion was at the fame time made for the national clergy, who were for the future to be paid by the flate. On the day following that on which this important meafure was adopted, a decree was paffed, fufpending the parliaments of the kingdom from the exercife of their functions.

Decrees, in which the interefts of fo valt a multitude Fruitlefs ${ }_{2}^{270}$ of individuals were involved, could not be carried intoattempts effect without much murmuring and oppofition. The of the parparliaments, in particular, began to exert themfelves laments. with vigour, and, by protefts and other publications, attempted to invalidate the decrees of the Affembly as illegal ; but thefe privileged bodies, who had often been accuftomed to contend with fome fuccefs againft the defpotic adminiftration of their country, and on that account had been for ages the objects of public applauf, now found themfelves utterly forfaken, and unable to refift the mandate of a popular Affembly. After a few fruitlefs ftruggles, they were all of them under the neceflity of fubmitting to their fate.

Nothing remarkable now occurred for fome time. Municipa. The Affembly procteded to organize the kingdom by lities effathe eftablithment of municipalities, and by reforming blithed, \&c, the jurifprudence of the country. It is to be obferved, however, that when the parliament of Paris was abolifhed,

Trance.

March
liked, the Chat let, being the fecond court in that city, was retained for the purpole of trying thofe perfons who had become mont obnoxious by their :attachment to the royal caufe. 'this court had the fpirit to arquit the Baron de Bezenval, Marlad Broglio, and the Prince de Lambefo. But having incurred much popuiar odium on this account, they were suity of the unworthy meannefs of condemning to death the Narquis de Favres, for a pretended confiracy (of which no tolerable proof was ever brought) to mafacre La Fayette, Bailly, and Neckar, and to convey the hing to Peronne.

During the whole of this winter the king had been very itrictly watched by numerous guard's placed around his palace, infomuch that the other nations of Europe confidered him as in a ttate of captivity. To do away this impreffion, if poffible, and to make their hing appear a voluntary agent in the meatures that had lately been adopted, was now regarded as a matter of cone importance. Every effort was therefore made to prevail with him to come to the Affembly fuddenly, and, as it were, of his own voluntary motion, there to declare his adherence to the meafures which had lately been adouted. For lome time he relifled this propofal; but at length, on the 4 th of February, he did fuddenly appear in the National Affembly, where he complained of the attempts that had been made to thake the new conftitution. He declared his winh "that it fhould be univerfally known that the monarch and the reprefentatives of the mation were united, and their wihes were the fame; that he would defend the conntitutional liberty of the fate; that, in conjuntion with the queen, he would early form the fentiments of his fon for that new order of things which the circumftances of the empire had introduced." This declaration difpirited the ariftocratic party in no fmall degree, and increafed that unhappy tendency of looking for aid from foreign countries which they had always been too apt to indulge.
On the $13^{\text {th }}$ of February, monafic elabliliments wcre fupprefled, and their lands confifcated; but the prefent friars and nuns were allowed penfions for their fubfflence, and t.) continue the oblervance of their monallic vows, if they thought fit. We may obferve here, that, in confequence of the evacuation of the monaiteries, it is probable that about this time the Braton committee legan to affume the appellation of the facobin Club, from the hall belonging to the Jacobin friars at Paris, in which their meetings were now held.

An event occurred at this time which tended in no fmall $i$-gree to increafe the odium under which the old government already laboured. This was the publication of the Red Book, or lift of penfions and donations granted by the crown. In confequence of the molk prefling inflances, it had been communicated by M. Neckar to a committee of the affembly, after many entreatic, and the moft folemn promifes of fecrecy it afforded, however, too friking an :dvantage to the popular party not to be made ufe of, and in a few dacy M. Neckar, to his no fmall furprife, faw this reginer publicly fold by every bookfeller in Paris. Hc ought not, indeed, to have been furprifed; and the giving up of this litt is one of the many proofs which the tranfactions of that period affiord of his great unfitnefs for the oflice which he held. With much indignation, hovever, he de-

 gan to lofe the coridence of the pethe. 1, , al a: this time, fertile cauto of alarm prevalcd on ... ato if a The clergy were attempting to revise in the porince the ancient anmolities between the K man C abolic, and the Proteltante, alcribing the late decrets of the Afembly to the latter. The Gemman princes who poifefied property in the north of France were complaining loudly of the violation of their rights by the aivolition of the feudal fyllem, although the National 1 fembly had voted to them a compenfation. Tiemolt melancholy intelligence was received from their colonies in the Wett Indies. In regulating thele, the drembly had not recognized the right of the free negroes to enjoy the lame privileges with other citizers; at the fame time, they did not go the length of denying the: privileges. This uncertain conduct produced infinise calamities. The whites contended with thofe commo:ly called pecple of colour. Thele again fometimes itrod in oppotition to the free negrocs, of to the tlaves; and hence it fometimes happened that nu lefo than three hodile afemblies were held at the fame time in the fame colony, which made war upon each other with the mont inveterate fury. Each party found proteclors in the National Alembly of the parent Aate. Thote who favoured or oppofed the exittence of ditinctions at home, in general followed out the fame principle nith regard to the colonies.

On the I 4 th of May, N. de Montmorency commu- D hate nicated to the National Affembly the preparations for power to war in which England and Syain were engaged. Thin fowertare brought forward the contitutional question, "Whopeace and ought to poffefs the power of declaring puace and war : war. The Count Clermont Tomerre, IIeflis de Serent, Vi. rieu, and Dupont, fupporied the royal prerugutive; while on the other fide, the exclufive right of the leginhe tive body to exercife this important prerogative wa fupported by Mefrs d'liguillon, Gurat iun. Frcteau, Iellot, Charles Lameth, Sillery, Petion, Kobefpierve, \&c. M. Petion propoled a decree "that the French nation renounced for ever all idea of conquell, and confined itfelf entirely to defenfive war;" w!ich was paffed with univerfal acilamation. The Count de Mirabeat at length fuccefsfally propofed that peate and war thould be declared by the king and the legillative hody in conjunction; and the deciee that wan panded on tixe libject? is a ftrange farrago of contradictions and abfurditics. 1 enjoind the king to "geard the thate frome ctend attacks." Put how could this be done, without repel. ling any attack that might be made upon it: This, however, he could not do, without previoully inform ing the National Affembly; and of that body chareet

On the 16 th Junc a a very fingular furce was ated in the Ahembly. A Pruhan retugee, rho critid himLif Anclaris Clout, and who was droeching hard to briv: himfeli into public notice, on an evenn. 5 littirg (which, it is to be offerved, was generally ill attended y the perions of the hisheit rank), introluced to the Aftimbly a number of perfens dreffed in the cifferent hobits of all the dini rent cuntries that coali be thought ori. In a formal harangu: he told the Afembly that he was come, as the cratur of the human race, it the ho. if the remelentatives of all mations, to congratulate then upon the furmation of their new conftitution. He was antwered by the prefident with abundance of :olemmity, and retired with his motley groupe. This ittantical picce of ielly, which in any other country than France would farcely, perhaps, have excited a mile, was treated by the Afiembly in a ferious light. Alexmader Lameth propofed, that the figures of different mations exhitited in chains at the feet of Lous
$\therefore 8$
Abce: in
ol hetevita
ry ut. s. XIV, heuld be deltroyed as an infult upon mankind. M. Lambel, a lawyer, at this moment propofed the abclision of all hacrofinary tithes. He was lupported ty La Fajette, St Fargenu, and the Vifcount de Noailles. The decree was paficl, along with another fuppreting all armorial beatirg: It is our intention at prefent rather to fate facts thon to lezard any political opimion concerning the wildom or folly of the tranfactions which we record. It may here, however, be remarked, that no part of the proceedings of the French National Affembly was received by perfons of rank upon the Contine:at of Europe with is much indignation as this. The feudal fyftem had been overtumed, and the property of the church wretted from it, with little comparative notice; but when thofe nominal diltinations were attacked which antiquity had fanctioned, and perfonal varity rendered dear, the furrounding nations were mimantly alarmed, and beheld with terror the levelling precedent. We may likerwife add, that no part of their proceedings was more inimical to rational and practical freedom. To preferve a perfect equality of ranks is impotible. In a commercial nation, induftry will precure wcalth, and wealth will every where procure dependents. Now nothing more contributes to keep within fome tolerable bounds the iniolence of newly acquired wealch, than the rank attzehed to birth and nobillty, which time and prejudice have confifired to make refpectable. It is not a litile temarkable, that of all the King's minifless, Neckar alune, a plebeian, a republican, born and bred in a democracy, advifed his majelty to refure his affent to this foolith decree, as a viulent bu: uftefs enervachment upon the prejudices of a powerfill order of the itate.

In the men tine, the cafital was entircly engronied by hurry and buttle. NI. Bailly had propoled a phan for commencerating the amiverfary of the tahing of the Palitic. It was adopted, becaule it tiattered the $v$ wity of the peoul by preienting them with a fylendid fectacic in commenamation of their own exertions. -The arny had been mouch diforemined ; and it was refolved to attempt to uniec all its brancioc, as well as the whate drartments of the hat, in one cantu:. di-
tachment in the rew order of things, by collecting intu fras en one phace dopurations, for the purpofe of fwearing fide. lity to thic ne, conftitution. In the middle of the Cf.an de Nurs an altar was erected, at which the civic oath, as it was called, was to be taken. Around eremony the altar an amphitheatre wan thrown up capabie of con-tederation. t. ining 400,000 fpectators: 2500 workmen were employed in this operation; and the people of Paris fearing left the plan might not be completed, afinited in the labour. All ranks of perions, the nobles, clergy, and cven ladies, with the eagernefs for novelty fo Fe culiar to that people, united their efort: Crowds of foreigners as well as natives hurried to the capital to be prefint at thi folemnity, which was called the Confederation. The long-expected 1 th of July at length ar rived. At fix o'clock in the morning the proceflion was arrangcal on the Bonlevards, and confited of the electors of the city of Paris, the reprefentatives of the commons, the adminillrators of the municipality, a battalion of children, with a ftandard, inferibed " The hopes of the nation;" deputics from the troops of France wherever quartered, and of every order, along with deputies from all the departments; to thele were added immenfe detachments of the military, and of the national guards, along with an almolt infinite multitude of drums, trumpets, and mufical inttruments. The proceffion was extremely fplendid, as excry diftrict had its peculiar decorations. The national affembly paffed through a grand triumphal arch, and the king and queen, attended by the :oreign minifters, were placed in a fuperb box. After a folemn invocation to God, the king approached the altar, and, amid!t the deepeft filence, took the following oath:" I the king of the French do fwear to the nation, that I will employ the whole power delegated to me by the conflitutional law of the flate, to maintain the conftitution, and enforce the execution of the law." The prefident of the national affembly then went up to the altar, and took the civic oath, " I fwear to be faithful to the nation, the law, and the king; and to maintain with all my powers the conftitution decreed by the national affembly, and accepted by the king." Every member of the affembly ftanding up, faid, "That I iwear." La Fayette then advancing, took the oath for himfelf; the other deputies of the national guards pronouncing after him, "That I fwear ;" and theie words were folemnly pronounced by every individual of this immente aflembly. Te Deum was then fung. The performance was fublime beyond the powers of defcription. Never perhaps before was there luch an orcheitra, or fuch an audience: their numbers baffed the eye to reckon, mind th. : ihouts in full chorus rent the ikies. It is impoflible to enumerate all the means which were emplozed to add flendor to this day. It ended with a general illummation, and no accident diturbed the public thanquillity.

The afiembly now proceeded in the formation of the The fol conltitution with conflerable tranquillity; whi h. how. dre at cver, was difurbed by an uthappy event at Nasty. Nattr diff Mof of the officers of the amay were unfriet,dy to the corfethe late revolution, and every means had been employed $q$ ences. by them to difgutt the foldiess with it. At Naney, in particular, neceflaries hod been denied them, aral t! cir p.y wis kept back, under preience that this w.s, the will of the national adembly. with a deati", head, furromeded by a harsivacath, on One cuff, mul a fuord on the other; with the mots?, " Compuer or die." The king van alio furmon!ed ty crowd of no juring prielts and other difatected ma:fins. Thu, that ropular jealoufy whi.h in uses perin:! -t the revolution has frikimily marked the Prench chanter, wa keft on the almm:. On the 1 gth of $A$ pril, thetan, whon the royal family was preparing to so to St Clond to pafs lome days, a report was intantIf fured that the hing was about to dly from the country. 'i'le carriages ware immediately furrounded by people. La Fayette drew out the national guard, but they refufer to act. "We know (exclaimed they) that we ate riolating the laws, but the faticty of our country is the firll law." The king indlantly went to the afembly, and with much $f_{\text {firit }}$ complained of the infuit. He was anfwered refpectfully by the prefident, and continucd his journey. As the royal fataily had $\epsilon$ joyed a confiderable degree of freedom for fome time pith, which was demonfrated by the minuceffal oppofition made to this jouncy-the prefent opportunity was embraced for intimating to foreign courts his acceptance of the contitution; and all obnoxious perfons were difmiffed from about his perfon. The breach of difcipline on the part of the national guard on this occafion was fo much refented by La Fayette, that he rehgned his command. Paris was thrown into confternation; and it was not till after the moft univerfal folicitation that he was prevailed upon to refume his oflice.

About this time M. de Bouille, to whom the protection of the frontiers was entrufted, was employing, as it is now faid, every means in his power to render the country defencelefs. The garrifons wete left unprovided; difunion was fpread among the national troops; they were removed from the frontiers, and their place was occupied by foreigners, wherever it could be done. The emigrants abroad, and their friends at home, were lying in wait for an opportunity of revolt ; when fuddenly, on the 21 it of June, it was announced from the Thuilleries, that the king, the queen, the dauphin, with montieur and madame, had quitted the palace and the capital, without leaving any information of their intention or their routc. The emotion excited by this news among the multitude was a mixture of confternation and rage. The national affembly, however, acted with much coolnefs. They intlantly took upon themfelves the government, and decreed their fittings permanemt. They fent meflengers, at the fame time, in all directions, to attempt to lay hold of the fugitives. Thefe had taken different routs. Monficur and madame arrived fafely at Bruffels on the 23 d. The king, queen, and their children, when they came to a confiderable diftance from the capital, were funifhed by Bouillé with a guard of dragoons, under pretence of protecting treafure for the pay of the troops. At the diftance of 156 miles, and when only a few leagues from the frontiers, they were arrefted at St Menehould by the poffmafter, M. Drouet, formerly a dragoon in the regiment of Condé. At half paff feven o'clock in the evening the carriages ftopt to change horfes at his houfe; he thought he recollected the queen, and imagined that the king's facc refembled the impreffions flamped upon affignats. The efcort of dragoons inreafed the fufpicion. He fuffered them to depart at

II oclock vitiout notice; but taking a companion France. with him, he went by a fhorter road to Varennes. 1 -79t. With the alditance of the poilmatter there he gave the ${ }^{1790}$ atain, and overtumed a carriage on the bridge, which The king detaned the royal travellers till the national guard of and queen the place had affembled, and the arreft was effected ancfled at without Bloodthed. They were brought back to Pa-Vareanes, ris by a deputation from the afembly. At his departure, the king had imprudently left behind him a memorial, in which he declared, that he never had thought any dacrifice too great for the refioration of order ; but that the dedtuction of the kingdom, and the triumph of anarchy, being the only reward of ail his efforts, he thought it neceffary to depart from it. He then takes a revicw of the faults of the new conftitution, the grierances he has futiered ; and protefts againft every thing that he had been compelled to do during his captivity.

Different parties were very differently affected by this Confequen-ill-conducted and unfortunate flight of the king. A ces of this fmall republican party had alrcady begun to appear, unfortahate and during the king's abfence, attempts were made to induce the pablic at large to confider the royal authority as no neceffary part of a free conftitution. But the minds of men were by no means prepared for the reception of this rew doctrine. The idea, however. having been thus publicly propofed, left fome imprefions, which in tine contributed to give rife to important event:. By far the greater number of leading men, however, here at prefent convinced, that it was impoffible to conduct a great empire like France, well and profperoufly, without the affiftance of an hereditary chief. They therefore determined to pafs over the affair with as much filence as poffible, and to haften the period when their new conftitution ftould be complete. But there is realon to believe, that this journey was at the long-run highly intrumental in producing very fatal effects to the perfonal fafety of the monarch.

His flight feemed a fignal for emigration. Many of the ariftocratic party fent in refignations of their feats in the national affembly. Troops ncre levied on the frontiers in the king's name; who took care, however, to difavow any connexion with fuch a procedure. Bouillé emigrated, and afterwards fent to the affembly a furious thrcatening letter: "You fhall anfwer (fys he) for the lives of the king and of the queen to all the monarchs of the univerfe. Couch but a fingle lair of their heads, and not one flone thall be left upon ancther in Paris. I know the roads. I will conduct the foreign armice. This letter is but the forerunner of the manifetlo of the fovereigns of Europe."

A confidcrable calm throughout France followed thefe events, and it might be regarded as in a flate of tranquillity. It contained, indeed, parties entertaining much animofity againft each otlier, and many citizens had withdrawn to foreign countries; but the peace was not broken, and moderate men hoped that much profperity would follow from the late agitations. But this calm was delulive; and in the midil of it thofe projects were formed which vere afterwards to prove fo fatal to the 294 peace of France and of Europe. Towards the clofe of freaty of this fummer, a convention toch place at Pilnitz in Sax-Filatz. ony between the emperor Leopold and the king of Pruffia. Its object was not hown at the time, but it gradually came into vicw, and is now by many underflood

France. food to have been intended for the purpofe of conclud-
ing a leaguc for the invafion of France, the new-model-
ling of its government, and the partition of fome of its fairelt provinces. The following paper has been repeatedly publifhed as the copy of a treaty concluded and figned at Pavia, and is generally underitood to have beet identical with, and therefore known by, the name of the Treaty of Pilnitr. We are far from vouching for its authenticity. It may have been fabricated by the French alfembly, to unite all parties in the nation agair:f the foreign powers which threatened to invade them. Bat in itating the events of this revolution, it is perhaps ilill more necellary, for the purpofe of rendering the actions of men comprehenfible, to give an account of what was at the time belicved to have occur-ed, than it now is to afcertain what was actually true.

## Partition Treaty between the Courts in Concert, concluded and Jigned at Pavia, in the Month of fuly 1791.

His majefy the emperor will take all that Louis XIV. conquered in the Auftrian Netherlands, will give them to his ferene highnefs the elector Palatine; fo that thefe new poffeffions, added to the Palatinate, may bereatter have the name of Auftrafia.

His majelty will preferve for ever the property and poffelfion of Bavaria, to make in future an indivifible mafs with the domains and hereditary poffeffions of the houfe of Auftria.

Her ferene highnefs the archduchefs Maria Chriftina fhall be, conjointly with his ferene highnefs her nephew the archduke Charles, put into hereditary poffeffion of the duchy of Lorraine.

Alface fhall be reftored to the empire; and the bifhop of Strabourg, as well as the chapter, thall recover their ancient privileges, and the ecclefiaflical fovereigns of Germany fhall do the fame.

If the Swifs Cantons confent to accede to the coalition, it may be propofed to them to annex to the Helvetic league the bihopric of Porentrui, the defiles of Franche Comté, and even thofe of Tyrol, with the neighbouring bailiwicks, as well as the territory of Verfoy, which interfeats the Pays de Vaud.

Should his majeity the king of Sardinia fubfcribe to the coalition, La Brefle, Le Busey, and the Pays de Gex, ufurped by France from Savoy, flall be reftored to him.

In cafe his Sardinian majelty can make a grand diverion, he thall be fuffered to take Dauphiné, to belong to him for ever as the neareft defcendant of the ancient dauphins.

His majefty the king of Spain fhall have Rouffillon and Bearn, with the ifland of Corfica; and he flall have the French part of the illand of S: Domingo.

Her majelty the emprefs of all the Rufias fhall take upon herfelf the invafion of Poland, and at the fame time retain Kaminiech, with that part of Podolia which borders on Moldavia.

His majelty the emperor thall oblige the Porte to give up Chocim, as well as the fmall forts of Servia, and thofe on the river Lurna.

His majelty the king of Pruffia, by means of the sbove-mentioned invalion of the emprefs of all the Ruffias into Poland, thall make an acquifition of Thorn and Dantzic, and there unite the Palatinate on the eaft so the confines of Silefia.

His majefty the king of Pruffia flall befides arquire FI, Luface ; and his ferene highnefs the clector of Sixuny $\underbrace{\text { Ol }}_{\text {B }}$ Glall in exchange receive the reft of Poland, and oc- $1 / 91$. cupy the throne as hereditary fovereign.

His majetty the prefent king of Poland thatl abdicate the throne on receiving a fuitable annuity.

His royal lighlmets the clector of Saxony fhall give his daughter in marrigge to his ferene highnefs the youngelt fon of his royal highnefs the grand duke of all the Ruflias, who will be the father of the race of the hereditary kings of Poland and Lithuania. (Signed) Leopold. Prince Nissiu. Coust Florida Blas. ca. Bischoffswerder.

In the mean time, the national anembly was haften-The ${ }^{29,}$ ing fall to the completion of the new coniltitution. It conftiution was Ginilhed on the 3 d of September, and prefented to concluded the king. It begins with the following declaration of by the afo the rights of a man and a citizen: and thereafter follow fembly the different branches; the chicf of which are here tranflated.
I. All men are born, and remain, free and equal in rights: focial diftinctions cannot be founded but on common utility.
II. The end of all political affociations is the prefervation of the natural and imprefcriptible rights of man : thefe rights are liberty, property, lecurity, and refiftance againit oppreflion.
III. The priaciple of fovercignty refides effentially in the nation: no body of men, no individual, can exercife an authority that does not emanate exprelisly from that fource.
IV. Liberty confints in the power of doing every thing except that which is hurfful to another : hence the exercife of the natural rights of every man has no other bounds than thofe that are necelfary to enfure to the other member of fociety the enjoyment of the fame rights: thofe bounds can be determined by the law only.
V. The law has a right to forbid thofe actions alone that are hurtful to fociety. Whatever is not forbidden by the law, cannot be hindered; and no perfon can be conflrained to do that which the law ordaineth not.
VI. The law is the exprefion of the general will . all the citizens have a right to concur perfonally, or by their reprefentatives, to the formation of the law : it ought to be the fame for all, whether it protect, or whether it punim. All citizens being equal in the eye of the law, are equally admiffible to dignities, places, and public offices, according to their capacity, and without any other diflinction but that of their virtue and their talents.
VII. No man can be accuifed, arrefted, or detained, except in cafes determined by the law, and according to the forms which the law hath prefcribed. Thole who folicit, difpatch, execute, or caale to be executed, arbitrary orders, ought to be punifhed ; but every citizcn that is fummoned or teized in virtue of the law, ought to obey infantly - he becomes culpable by refiflance.
VII. The law ought to eflablidh fuch panilhments only as are itrictly and evidently necefiary; and no perfon can be punifhed but in virtue of a law ellablithed and promulgated prior to the offence, and legally applied.
IX. Every man being prefumed imnocent till fuch

## $\frac{101}{1091}$

 Firase comerd, not necefary to fecure his perfon,

X. A verin that he mictied for his opinime, even
 We ninions dos nea diturb the pablic onder eftaWinct by the !: $:$.
XII. The free commaniation of thought, and of winion, is one of the mult precious rights of man. Weery citizen. therefore, may frecly fpeak, wite, and publih, his fumiment ; futect, however, to anfwer tir the alue withai liont, in cafes determined by the Lum.
XII. The guarmite of the Richts of Man and Citizenc, invoise a necelity of pablic force: this force is then imatuted ter the advantage of all, and not for the particular utility of thofe to whom it is confded.
XIII. For the maintenance of public force, and for the expences of auminilration, a conmon contribution is indipenfaby necellay: : this contribution thould be equally divided amongt all the citizens, in proportion Th, their abilties.

N1V. Every citizen has a right, by himfelf, or by his reprefentatives, to decide concerning the nectlity of the public contribution; to confent to it freely; to luok after the employment of it ; to determine the quantity, the difribution, the collection, and duration.
XV: The fociety has a right to demand from every fublic agent an account of his adminitration.

XTI. Leery fociety, in which the guarantee of rights is not affured. nor the ieparation of powers determined, has no confisution.

XTII. Property being a right inviolable and facred, no perfon can be deprived of it, except when the public necelity, legally afcertaired, fhall evidently require it, and on condition of a juit and previous indemnification.

The conflitution guarantecs, as natural and civil nights,

1. Tlat all citizens are admifible to places and em!loyments without any dilinction, but that of ability and virtue.
2. That all concributions flall be divided equally among all the citizens, in proportion to their means.
3. That the fame crimes thall be fubject to the fame purihmente, without any diftination of perfons.

The confitution in like mamer guarantees, as natural and civit richits,

Liberty to all neen of going, itaying, or departing, without being arrelted, or detained, but according to the forms precreribed by the con Pitution.

Liberty to all men of fpeaking, witing, printing, an! " fublifhing their thought, without having their writines fubjeced to any examination or infection be©re jublication ;" and of eserciting the religious worthis) the which they are antached.
thenty to all citizno of affen' hang peaceably, and siblot arm, complyins with the tha of police.

it en entitution furme. ©e the inion hatity of pro.

 faritue

A public inteaction atall be created and orgonizad, France. common to all citizens, gratuitous with tegatd to thole parts of tution indifpentable for all men, and of which 1.91. the eltablithonent hat be gradually dintributed in a poo. pertion combined with the divinon of the kingdom.
" The king dom is one and indivinble;" its territory, for ahminitration, is diftrimited into 33 departmente, each department inso difricts, cach diluit into cantons.

Those are French citizens,
Who are born in France, of a French father;
Who having been born in France of a foreign father, have fixed their refidence in the kingdom;

Who having been born in a foreign country, of a French father, have returned to fettle in France, and have taken the civic oath :

In fine, who having been born in a foreign country, being defcended in whatever degree from a Frenchman or Frenchwoman, who have left their country from religious motives, come to reflde in France, and take the civic oath.

The right of French citizenfhip is loit,
1ft, By naturalization in a foreign country ;
2dly, By being condemned to penalties which involve the civic degradation, provided the perfon condemned be not re-inilated;

3 dly, By a fentence of contumacy, provided the fentence be not annulled;
$4^{\text {thly }}$, By initiation into any foreign order or body which fuppofes either proofs of nobility " or diflinctions of birth, or requires religious vows."
"The law coniders marriage only as a civil contract."

The fovereignty is one, indivifible, "inalienable, and imprefcriptible," and it belongs to the nation: no fection of the people, or individual, can arrogate the exercife of it.

The nation, from which alone flow all powers, can not exercife them but by delegation.

The French conititution is regrefentative: the reprefentatives are the legiflative body and the king.

The National Alfembly, forming the legilative body, is permanent, and confilts of one chamber only.

It thall be formed by new elections every two years.
The legilative body cannot be diflolved by the king.
The number of reprefentatives to the legillative body fhall be $7+5$, on account of the $\$_{3}$ deparments of which the kingdom is compofed ; and independent of thofe that may be granted to the colonies.

The reprelentatives fhall be diftributed among the departments, according to the three proportions of land, of population, and of the contribution direct.

Of the 74 , reprefentatives 247 are attached to the lant. Of thele each department hatl nominate three, except the department of Paric, which thall nominate only one.

Two hurdred and forty-nime reprefentatives are attacher to the population. The total mafi of the active T.1 ulatins of the kinglom is divided into 249 parts, as. I wath denatment nominates as many of the derntins as is cerraits parts of the population.

Trio bunded and forty nine venomentatives are at tacirel to ihe conribution direat. The fum total of the diact contribution of tlee kinglam is linewife divided into 249 patt, and each department nominetes as many du...ies is it : 2 : pats of the contribution.

## F R A [ : 20 ] F R A

In order to form a legillative national afiembly, the active citizens thall convene, in primary affemblice, every two years in the cities and contons.
"The primary aftemblies flall meet of full right on the firlt Sunday of March, if not convoked fooner by the public othicers appointed to do fo by the law."

To be an active citizen, it is neceflary,
To be a Frenchman, or to have become a French. n.an;

To have attained 2 ; years complete;
To have refided in the city or the canton from the time determined by the law;

To pay in any part of the hingdom a direct contribution, at lealt equal to the valne of three days labour, and to produce the acquittance ;

Not to be in a menial capacity, namely, that of a fervant receiving wages;

To be inferibed in the municipality of the place of Lis refidence in the lift of the national guards ;

To have taken the civic oath.
The primary affemblies thall name electors in the proportion of the number of active citizens refiding in the City or canton.

There thall be named one elector to the affembly, or not, according as there thall happen to be prefent 100 active citizens.

There fhall be named two, when there thall be prefent from 151 to 250 , and fo on in this proportion.

The electors named in each department fhall convene, in order to choofe the number of reprefentatives, whofe nomination thall belong to their department, and * number of fubititutes equal to the third of the reprefentatives.
"The allemblies fhall be held of full right on the laft Sunday of March, if they have not been before convoked by the public officers appointed to do fo by law."

All active citizens, whatever be their itate, profeffion, or contribution, may be chofen reprefentatives of the nation.

Excepting, neverthelefs, the minifters and other agents of the executive power, \&c.

The members of the legillative body may be re-elected to a fubfequent legillature, but not till after an intersal of one legiflature.

No active citizen can enter or vote in an allembly if be is armed.

The reprefentatives mall meet on the firt Monday of May, in the place of the fittings of the latt legillature.

The royalty is indivifible, and delegated herecitarily to the race on the throne from male to male, by order of primogeniture, to the perpetual exclution of women and their defendants.

Nothing is prejudged on the effect of renunciations in the race on the throne.

The perfon of the king is inviolable and facred; his only title is kirg of the French.

If the king put himfelf at the head of an army, and direct the forces of it againlt the nation, or if he do not oprime, by a formal act, any fuch enterprife undertainen in his name, he thall be held to have abdicated.

If the king having gone ont of the kingdom, do not return to it, after an incitation by the legiflative body, within the face which hall be fined by the pro-

Fol. IX. Part I.
clamation, "and which cannot be lefsthan two nenths," Fran " he thall be held to have abdicated the royalty.

After abdication, expretis or legal, the hing thall tee $3-9 \mathrm{t}$. in the clafs of citizens, and may be accuted and tried like them, for acts pollerior to his abdication.

The nation makes provition for the fiplende ur of th: throne by a civil lifl, of which the legitlative body thal! fix the fum at the commencement of each reign, for the whole duration of that reign.

The king is a ninor till the age of 18 complete; and during his minority there thall be a regent of the kingdom.

The regency belongs to the relation of the king, neat in degree according to the order of fuccellion to the throne, who has attaned the age of 25 ; provided he be a Frenchman refident in the hingdom, and not prefumptive heir to any other crown, and have previvioully taken the civic oath.

The prefumptive heir thall bear the name of Prince Royal.
" The members of the king's family called to the eventual fuccetfion of the throne, thall add the denomination of French Prince to the name which hall be given them in the civil act proving their birth; and this name can neither be patronymic nor formed of any of the qualifications abolithed by the prefent conftitution.
" The denomination of prince cannot be given to any individual, and thall not carry with it any privilege or exception to the common right of all French citizens."

To the king alone belong the croice and difmimion of minifters.
"The members of the prefent national affembly, and of the fubfequent legillatures, the members of the tribunal of appeal, and thofe who thall be of the high jury, cannot be advanced to the minitry, camot reccive any place, gift, penfion, allowance, or commition of the execntive fower or its agents during the continuance of their functions, or during two years efter ceafing to exercife them : the fame fhall be obferved tefuecting thofe who thall only be infcribed on the lit of high jurors as long as their inticription thall co:tinue."

No order of the king can be executed if it be not figned by him, and counterfigned by the minitic: o: comptroller of the department.

In no cate can the written or verbal order of a hing flelter a minifter from refponfibility.

The conflitution delegates exclutive!y to the lesi.. tive body the powers and functions following :

To propole and decree laws-The hing can only invite the legilative body to take an object into confideration;

To fix the public expences;
To eitablith the public contributions, to determine the nature of them, the amount of each fort, the duration, and the mode of collection, \&c.

War cannot be refolved on but by a decree of the national affembly, paffed on the formal and necellary propolition of the king, and fanctioned by him.

During the whole courfe of war, the lecitlitive boty may require the king to negotiate peace; and the hing is bound to yield to this requilition.

It belongs to the legillative body to ratify treatie of

## $\mathrm{F} R \mathrm{~A} \quad\left[\begin{array}{lllllll}130\end{array}\right] \quad \mathrm{F} \quad \mathrm{R} A$

Fine ferce. athatice, and commerce ; and no treaty thall have
s-01. effect but by this ratilication.

The deliberations of the legillative body fhall be
public, and the minutes of the littings thall be printed.

The legilative boty may, however, on any occation, form itfelf into a general committec.

The plan of a decree fhall be read thrice, at three intervals, the thorteit of which cannot be lefs than eight แงy.

The decrees of the leginative body are prefented to the king, who may refule them his confent.

In cafe of a refutal of the royal confent, that refufal is only futpenfire. When the two following legitla-ture- liall fuccellively prefent the fame decree in the fame tern:s on which it was originally conceived, the king thall be deemed to have given his fanction.

The king is bourd to exprets his confent or refufal to each decree within two months after its prefentation.

No decree to which the king has refufed his confent can be again prefented to him by the fame legillature.

The fupreme executive power refides exclufively in the hands of the king.

The king is the fupreme head of the land and fea forces.

The king names ambalfadors, and the other agents of political negociations.

He beftows the command of armies and fleete, and the ranks of marlhal of France and admiral:

He names two-thitds of the rear-admirals, one-half of the lieutenant-gencral', camp-marihals, captains of fhips, and colonels of the national gendarmerie:

He names a third of the colonels and lieutenant-colonels, and a iisth of the lieutenants of hips:

He appoints in the civil adminilfration of the marine, the directors, the comptrollers, the treaturers of the arfenals, the mafters of the works, the under matters of civil buildings, half of the maters of adminittration, and the under matlers of conifruction.

He appoints the commiflaries of the tribunals :
He appoints the fuperintendants in chief of the management of contributions indirect, " and the adminiItration of national domains :"

He fuperintends the coinage of money, and appoints officers entrulted with this fuperintendance in the general commiffion and the mints.

The effigy of the bing is ftruck on all the coinage of the kingdom.

There is in each department a fuperior adminillration, and in each diffrict a fubordinate adminitration.

The adminiltrators are fecially charged with ditributing the contributions direct, and with fuperintending the money arting from the contributions, and the public revenues in their territory.

The king has the right of amnlling fuch acts of the adminiftators of department as are contrary to the Law or the orders tranfmitted to them.

He may, in cale of obftinate difobedience, or of their endangering, by their acts, the fatety or peace of the public, fufpead them from their functions.

The king alone can interfere in foreign political connections.
S.very declaration of war thall be made in thefe terms: By the king fike Frinch in the name of the na$\therefore 0 n$

The judicial power can in no cafe be execifed eithor frarse by the legillative body or the king.

Jultice thall be gratuitoutly rendered ly judges chofen 1/9I. from time to time by the pcople, and inftituted by letters fatent of the king, who cannct refufe them.
"The public accufer thall be nominated by the people."
"The ight of citizens to determine difutes defnitively by arbitration, cannot receive any intringement from the acts of the legilative power."

In criminal matters, no citizens can be judged except on an accufation received by jurors, or decreed by the legilative body in the cafe in which it belongs to it to profecute the accufation.

After the accufation thall be admitted, the fact thall be examined, and deciared by the jurors.

The perion acculed thall have the privilege of challenging 20 , " without alligning aly reafon."

The jurors who declare the fact thall not be fewer than 12 .

The application of the law thall be made by the judges.

The procefs thall be public; " and the perfon accufed cannot be denied the aid of counfel."

No man acquitted by a legal jury can be apprehend. d or acculed on account of the fame fact.

For the whole kingdom there thall be one tribuna: of appeal, eftablithed near the legiflative body.

A high national court, compoled of members of the tribunal of appeal and high jurors, thall take cognizance of the crimes of minitters, and the principal agents of the executive power; and of crimes which attack the general fifety of the itate, when the legiflative body thall pafs a decree of accufation.

It hall not aflemble but on the proclamation of the legitlative body; " and at the ditance of 30,000 toifes at leat from the place of meeting of the legillative body."

The national guards do not form a military body, or an inftitution in the ftate; they are the citizens themfelves called to affilt the public force.

Otficers are chofen for a time, and cannot again be chofen till after a certain interval of fervice as privates.

None thall command the national guard of more than one dittrict.

All the parts of the public force employed for the fafety of the thate from foreign enemies are under the command of the king.

Public contributions fhall be debated and fixed every year by the legilative body, and cannot continue in force longer than the latit day of the following feffion, if they are not exprefsly renewed.
" Detailed accounts of the expence of the minifterial departments, figned and certified by the minitters or comptrollers-general, thall be printed and publithed at the commencement of the fefinons of each legiflature.
"The fame hall be done with the flatements of the receipt of the different taxes, and all the public revenues."

The French nation renounces the undertaking of any war with a view of mahing conquefts, and will never employ its forces againft the liberty of any people.

The conlituting national aflembly declares, "That
$F R A \quad\left[\begin{array}{lll}13 \mathrm{I} & \mathrm{J} & \mathrm{F} R \mathrm{~A}\end{array}\right.$

Frarce the nation las the impreferiptible right of changing its conftitution; and neverthelefs comfidering that it is more conformable to the national interest to employ only by means provided in the conftitution itfelf, the right of reforming thofe articles of it, of which cyperience thall have fhown the inconveniences, deceres, that the proceeding by an aflembly of revilion thall be regulated in the form following :
" When three fuccellive legillatures thall have exprefled an uniform with for the change of any contitutional article, the revifion demanded thall take place.
" The next legillature, and the following, cannot propofe the reform of any conititutional article.
" The fourth legillature, augmented with 2.49 members, chofen in each department, by doubling the ordinary number which it furnilhes in proportion to its population, thall form the affembly of revilion."

The French colonies and poffefions in Alia, Africa, and America, " though they form part of the French empire," are not included in the prefent conititution.

With refpeet to the laws made by the national affembly which are not included in the att of conttitution, and thofe anterior laws which it has not altered, they thall be obferved, fo long as they thall not be revoked or modified by the legillative power.

On the $13^{\text {th }}$ of September the king announced, by a letter to the prefident of the Affembly, his acceptance of the conititution. This event was ordered to be notified to all the foreign courts, and the Affembly decreed a general amnelty with refpect to the eve ts of the revolution. On the following day the king repaired in perfon to the National Affembly; and being conducted to a chair of itate prepared for him at the fide of the prefident, he figned the conflitutional act, and took an oath of fidelity to it. He then withdrew, and was attended back to the Thuilieries by the whole Afiembly, with the prefident at their head. On the 30th of September, this National Affembly, which has fince been known by the name of the Confituent $d_{l / t}$ em$b / y$, diffolved itfelf, and gave place to the fucceeding Legillative National Affembly, which had been elected according to the rules prefcribed by the new conaitu-

Character On the character and the labours of the Confituent and labours A/fembly, we fhall only remark, that it contained many of the conItituent affembly.
men of talents, and, in all probability, a confiderable number of men of integrity. 1 trwards the clofe of its fetfion, it affumed a very ftriking character of moderation, and appears to have been completely monarchical, although its jealouly of the ancient arilocracy prevented it from fufficiently guarding the throne againft popular violence : for a very frihing defect in the new conftitution foon appeared. The hing poffenfed a voro, or negative, upon the refolutions of the legillative body : but this negative he was bound to evercife in perfon, without refonfibility, and without the intervention of his miniters. He had no femate, or upper chamber, to ttand between him and popular violence ; and there was fomething apparently abfurd in fetting the vote of an individual in oppofition to the collective wifdom and will of a whole nation. In conferquence of thii, he was redaced to the hard alternative of yiching to every vote of the National Alembly, or of expoling !imfelf perfonally to public odium.

The new Arembly was opened b: the ling on the
$7^{\text {th }}$ of Oetwer, with nuch sparent
dides. His peech, recommending unamin in y an l cont: dence between the lognlative and excoutive funere, was 1701 . received with unirounded applane. Ithe characier of - - ., the men who compoted the new Nitional Aitionbly v...s an..nbey unateficious to the Coart. At the commencoment of omen! the revolution, the great body of the prople at a dift hat tance from the capiai were litile interetted in thole fro- chere th jeets of freedom which occupied the more enhightened mexicer or more turbulent inhabitants on l'aris. They had gradually, however, been rouled from their lechars. Ithe variety of powers conferred by the new conditution upon the people at large, and the multiplicity of oflices of which it gave them the patronage, hud kindled in the minds of men a love of dominion, and a with to interfere in publie affairs. This attached them to the new order of things. The love of power, which is the leatl difguifed paftion in the human heart, and equally ftrong in the breatt of the meaneft and of the higheft of mankind, was thus, under the name of liberty, become a leading pation throughout this wide empire. They who flattered it moth, and were mott loud in praite of the rights of the prople, beeame fpeedily the favourites of the public. The conlequence of this was, that the new National Affembly was clicily compofed of country gentlemen, of principles highiy democratic, or of men of letters who had publihed popular books, or conducted periodical publications. The member of the Contituent Affembly had been excluded by their own decree from holding feats in the new legillature.The members of the latter, therefore, had litile reged for a contitution which they themfelses had not framed, and which was not protected by the venerable fanction of antiquity.

When this Affembly firt met, it thowed a very Theirgestrilling attention to formalities, and a peevith jealoufy lnow if of the miniters of the erown. In the mean time, the fters of the treaty of Pilnitz, already mentioned, began to be ru-crown. moured abroad, and France was thrown into a flate of anxious jealouly for the fafety of its newly-acquired liberties. Although the Prolitans and Germans (the elector of Mentz alone excepted) all continued to temporize, the northern powers, Sweden and Rulfia, entered into trict engagements to refore the old defFotim of France. On the 9th of November, a decrce was paffed, that the emigrants who, after the tirt of January next, thould be found ahiembled, as at prefent, in a hottile manner, beyond the frontiers, fhould be confidered as guilty of a confpiracy, and fuffer death; that the Fenech prinees, and public functionarice, who thould not return before that period, thould be punihable in the fame manner, and their property forfeited during their own lives. On the 18 th, a feries of tevere decrees was alfo pafied againtt fuch of the cjected elergy as till refufed to take the civic oath. To both thele decrees the king oppofed his zeto, or negative. The moderate party, who were attached to the conititution, rejoiced at this as a proof of the freedom of their fovereign. But, on the other fide, it excited a mont violent clamour, and became the means of exciting new fulpicions of the wihes of the court. At this Pacific an. time anfwers were received from the different foreign fowerare courts to the notifieation fent them of the hing's ac- rumed euptance of the new conilitution. Thefe were general- twin ly eonceived ia a dile of caution, and avoided giving po eres.

## $\mathrm{F} R$ A $\quad\left[1 \jmath_{2}\right] \quad \mathrm{F} R \quad \mathrm{~A}$

France open ofience. The emperor even prohibited all affemblages of emigrants within his hates; and the king intimated to the Afembly that he had declared to the elector of Treves, that unlefs the emigrants fhould ceafe before the 15 th of January to make holtile prepa-
302 rations within his territories, he would be conidered as But the the enemy of France. All this, however, did not precourt is fill ferve the court from fulpicion; for although the diffefurpected. rent foreign courts had openly declared pacific intentionc, yet the French emigrants boldly aflerted, that all Europe was actually arming in their favour. Accordingly they ceafed not to folicit their equals in rank, who ftill remained within the country, to leave it to poin with them in what they called the royal caufe. The unhappy Louis, placed between a repullican party that was gradually gathering ftrength, and an ariftocratical party that was rouling Europe to arms againit a nation of which he was the conflitutional chief, and a combination of princes jufly fufpected of willing to feize upon a part of his dominions, flood in a fituation which would have perpiexed the mod ikilful Atatelman; and it is no proof of incapacity that he fell a facrifice to circumftances which might have overwhelmed any known meafure of human ingenuity. Addrefes were crowding into the Allembly, difapproving the conduct of the court. M. Montmorin religned; M. Deleffiart fucceeded him ; and M. Cahier de Gerville became minitter of the interior. M. du Portail religned alfo, and M. Narbonne fucceeded him as miniller of war. In the month of November, M. Bailly's mayoralty terminated; and the once popular La Fayette appeared as a candidate to fucceed him. But he was fuccelffully oppofed by M. Petion, a violent Jacobin, and a declared republican, who was elected mayor of Paris by a great majority.
At this period the moderate men, who were friends of the conllitution, attempted to counteract the influence of the Jacobin club by the ellablifhment of a fimilar one. It derived its name from the vacant convent of the Fenillans, in which it affembled. The molt active members of the Conftituent Affembly belonged to it, fuch as M. M. D'Andre, Barnave, the Lameths, Du Port, Rabaud, Sieyes, Chapelier, Thouret, Lahord, Taleyrand, Montefquieu, Beaunetz, \&c. The lacobins contrived to excite a riot at the place of their meeting, which was in the vicinity of the hall of the National Affembly. This afforded a pretext for apTlying to the Afembly for the removal of the new club. The Afembly thowed their difpofition, by complying with this requeft. luced to much diftrefs. The difpofitions of foreign rourts appeared very doubtful. The new year, howtwer, operied with delufive profpects of tranquillity.The German princes appeared fatisfiel with the mode of comperifation which the French had offered for the lofe of their poffefions in Alface and Lorraine. The prince of Lowefein accepted of an indemnification The princes of Hohenlohe and Salm-Salm declared themfelves ready to theat upon the fame terms. Prince

Maximilian, and the dukes of Wirtemberg and DeuxPonts, freely negociated. It is unnecellary to ftate in detail the fubterfuges employed, in the mean time, by the crafty Leopold, for amuling the French with the appearances of peace. M. Deleflart, minifter for foreign affairs, fell a facrifice to them, and probably to the undecided character of Louis. He was accufed by M. Brifot of not having given timely notice to the National Affembly of the difpofitions of foreign powers, and of not preffing proper meafures for fecuring the honour and fafety of the nation. A decree of accufation palfed againt him in his ablence. He was apprehended, tried by the high national court at Orleans, and executed in confequence of its fentence.

The fudden death of Leopold on the firf of March gave rife to a tranfient hope that peace might ftill be preferved. A fufpicion of poifon fell upon the French, murder of but it was removed by the detail of his dileale that was the king of fpeedily publifhed. On the 16 th of the lame month, Sweden. the king of Sweden was wounded by a nobleman of the name of Ankerltrom, and died on the 2gth. This enterprifing prince had overturned the conilitution of his own country, and he had formed the project of conducting in perfon his troops to the frontiers of France, and of commanding or accompanying the combined armies of Europe in their attempt to avenge the caute of infulted royalty. It was in a great mealure to counteract this lcheme that he was affallinated.

The fudden fall, however, of thefe two enemies rather accelerated than retarded the meditated hoftilitics. The young king of Hungary, who fucceeded to the
$\qquad$

$\square$ empire, made no fecret either of his own intentions or warlike inof the exittence of a concort of Princes againlt France, tentions. M. Dumourier was now at the head of the war-office, M. Roland was minitler of the interior, and M. Claviere minifter of finance. The Jacobins were all-powerful. The court gave way to the torrcut. The property of the emigrants was confifcated, referving the rights of creditors. The Imperial miniter, Prince Kaunitz, demanded three things of France; $1 f$, The reftitution of their feudal rights to the German princes; adly, To reftore Avignon to the Pope, the inhabitants of which had fome time before thrown off their allegiance, and prevailed with the Conftituent Affembly to receive their country as a part of France; and laitly, Prince Kaunitz demanded, that " the neighbouring powers fhould have no reaton for apprehemfion from the prefent weaknefs of the internal government of France." On recciving thefe demands, the king propofed a declaration of war, which was decreed by the National Afo. . ceive him. The national troops, unacculomed to fuf tain the fire of regular foldiers, were intlantly thrown into confulion, and Aled evers to the gates of Lille. The cry of treafon refounded on all fides; and their commander, an experienced and faithful oilicer, was murdered by his own foldiers and the mob. A fecond divifion of 10,000 men, under Lieutenant-General Biron, took poffeflion of Quiverain on the $29^{t h}$, and marched toward Mons. General Biron was here attacked by

At the end of this yerr, the kingdom of France was by no means profperous. The public revenue had fallen far ihort of the expenditure. The emigrant nobility had carried out of the kingdom the greater part of the current coin; and a variety of manufacturers, who depended upon their oftentations laxury, were refembly on the 25th of April, againt the King of IIungary and Bohemia.

The French immediately began the war, by attacking in three different columns the Auftrian Netherlands. M. Theobald Dillon advanced from Lifle to Tournay where be found a ftroncs body of Aultians ready to revis are

State of
France in the end of 7791 and beginning of $179^{2}$.

France.
the - Iuitrians, whom he repulfed. Hearing, however, of the defeat of Dillon, be retreated. A third party advanced to Funes, but aterwards withdrew. La Fayette at the fame time adranced towards Souvines, haif way to Numur, fron which he aiterwards retreated. The whole of theie expeditions were ill contrived, in as much as they divided the French undifiplined troops, and expofed them in fmall bodies to the attack of veteran forces. The Aulrians were fome time before they attempted to retaliate. At length, however, on the IIth of June, they attacked M. Gousion, who commanded the advanced guard of La Favette's army near Maubeuge. M. Gouvion vas killed by a rolling bullet; but La Fayette himtelf having come up, the Autrians abandoned the field. In the mean time, matters were hatening in Paris towards a violent crifis. Two parties, both of which were hoftile to the prefent conititution, had gradually been formed in the ftate. The one wihhed to give more effectual fupport to the royal authority, by eitablihing a fenate or two clambers, to prevent the king's vote from being the fole check upon popular enthufiafm. The other party withed to fet alide royalty altogether, and to hazard the bold experiment of converting France into a republic. Thefe latt were fupported by the Jacobin club, which had now contrived to concentrate in itfelf an immenfe mafs of intluence. Inaumerable popular focieties were eltablihed in every town and rillage throughout the provinces. With thefe a regular correfpondence was kept up by writing and by emillaries. Thus fchemes and notions were inftantaneoully propagated through a great empire, and all the violent fpirits which it contained were enabled to act in concert: But the more immediate engine of the republican party confitted of the immenfe population of the metropolis, whom they now endeavoured to keep in conltant alarm. For this purpofe they alleged, that an Aufrian Committec, that is to tay, a confpiracy in favour of the enemies of the country, exilted among the friends of the court. Mi. M. Genfonne and Brifot even offered in the affembly to prove the exiftence of this pretended Inttrian committee. A report was next circulated, that the king intended to abfound from the capital on the 23 d of May. His majetly publicly contradicted thefe accufations as calumnies, but they made no fmall impretion upon the minds of the public. Nes decrees were now made againt the refractory clergy, but thefe his maje:ty refufed to fanction. A propofal was allo made and decreed in the affembly to form a camp of 20.002 men under the walls of Paris, and that for this levy every canton in the kingdom thould contribute one herfeman and four infantry. The national guard of Paris difliked the propofal, and the king gave to it his negative. Indeed at this time the king feems to have come to a refolution of itanding out againt the Jaco in party, to which he had for fome time yielded. The miniltry were therefore difmified, excepting M. Damourier, and others were appointed in their flead. By this event Dumourier lott the confidence of the Jacobin clu'). He faw his error, refigned his office, and inined the army. In the mean time a decree had been phatied, authurifing the manufactory of pikes for the purpute of arminis cheaply the lower clafs of citizens. All means were ufed to render the king odions l,y inftmonato vritit e,
and harangues; an 1 in foth of $t$, ic in sontes inces. diary $M$ rat took the lead.

On the $202 h_{1}$ of atone M. K xberce, the procureur 1792. genceal fyndic informed the mation 1 ammbly, that, an sto contrary to law, tormidable budies of amos men were mob marcho preparing to preicnt petitions to the hins, and to the es through national afiemlly. i part of them tpeen': appeared the affemwith St Huruge and Santere a brewer as the ir head. bly, \& . They mazeched thro:gh the hall in a poocelion ther latted two hour, at fuur ochuck in the afwnom, to the number of atbout 40,000 . 'Thery furrounded ei Thuilleries. The gates were throws open ; and an wh attempt to break the door of the apartment where it king then was, he ordered them to be admitted. H: filter the princefs Elizabeth never departed from his fide during four or five hours that he was furrounded by the multitude, and compelled to liften to every illdignity. All this while Petion, the mayor of Pani, was unaccountably ablent. He at length, howeve:, arrived, and alfo a deputation from the affembly. The queen, with her chiddren and the princefs ce Lamballe, were in the mean time in the council-chamber, where, though protected from violence, they were yet expofad to much infult. At latt, in confequence of the approach of evening, and of the entreatics of Petion, the multitude gradually difperled.

The indignities fuffered on this day by the royal family were in fome refpects not unfavourable th their
 bitants of the capital were athamed of fuch proccedings. ed of fucl: They complained of them fevercly in a petition to the conduct. alfembly, and addreffes to the lame purpofe were received from leveral departments. The directory of the department of Paris, at the head of which were M. Rochefoucault and M. Talleyrand, publithed a declaration difapproving of the conduct of the mayor, and of M. Manuel the procureur of the commune, whom they afterwards fufpended from their offices, although they were fpeedily rellored by a decree of the allembly. A* the fame time, La Fayette leaving his army fudderly, appeared on the 26 th at the bar of the national aftembly. He declared that he came to exprefs the irdignation which the whole army feit on account of the events of the 25 th: he calle 3 upon the afiembly to punifh the promoters of thefe events, and to diflulve the factions clubs. The fudden appearance of La Fayctl" threw the Jacohins into conflemation, and from that period they never ceafed to calumniate him. 352

On the ift of July, on the motion of M. Iean de The hing Brie, the affembly ordered a proclamation to be made, if Pumfis that the country was in damger. (In the 6th, the king maran it gave intimation that the king of Prulta was marching France. with $52,000 \mathrm{men}$ to co-operate againt Fance. The French arms wore at this time fomewhat luvediful in the Aullrian Netherlands; but the cabinet ipeedily thought it necefary to order the armis to retreat : a meafure which was afterwads publicly confured by Mathal Luckner.
 al afembly. At the inftant the NI. Brifut wis ahout pecoh ot to commence an oration, N1. Lammourcte hihhop of the behp Leors regucited to be heard for a fess minute. He expatiated on the neculity of man annong the meml as of the aficably, and of excritiong their fallemenal pre-

315
judices on the altar of their country. He concladed an animated addrefs with thefe words, " Let all who hold in equal deteftation a republic and two chambers, and who wih to maintain the conftitution as it is, rife!" The words were fcarcely pronounced when the whole affembly itarted from their feats. Men of all parties folemnly embraced each other, and protetted their adherence to the conititution. A deputation announced this happy event to the king; who immediately came and congratulated them in a fhort feech, which was received with infinite applaufe. The only good efect, however, produced by this temporary agreement was, that the fellival of the $1 f^{\text {th }}$ of July, which was celebrated with the ufual magnificence, paffed over in tranquillity.

On the $25^{\text {th }}$ of July, the duke of Brunfwick iffued at Coblentz his celebrated manifefto. It declared the purpofe of the intended invalion of France to be the reitoration of the French king to full authority. It declared the national guard of France refponfible for the prefervation of tranquillity; and threatened with the punihment of death, as rebels to their king, thofe who thonld appear in arms againtt the allied powers. All men holding offices, civil or military, were threatened in the fame manner, as well as the inhabitants of all cities. The city of Paris in particular, and the national affembly, were declared refponfible for every infult which might be offered to the royal family. It was declared, that if they were not immediately placed in fafety, the allies were refolved to inflict " on thofe who fhould deferve it the mon exemplary end ever memorable avensing puniftments, by giving up the city of Paris to military execution, and expofing it to total defruction; and the rebels who thould be guilty of illegal refiftance thould fuffer the punilhmients which they thould have deferved." This fanguinary and imprudent manifeflo operated as a warrant for the deftruction of the unfortunate Louis XVI. It left no middle party in the nation. All who nifhed to preferve freedom in any form, and all who loved the independence of their country, were infantly united. At the fame time, the reproaches caft on the king by the Jacobins now gained aniverfal credit. The kings of Pruffia and of Hungary told the French nation, that their monarch was fecretly holtile to the conftitution; and the reftoration of him and his fantily to defpotic power was made the fole pretence for a bloody and dangerous war.

The republican party faw the advantage which they had now gained, and refolved upon the depofition of the king. The chief engine which they meant to employ in this fervice confilted of about 1500 men, who had come to Paris at the period of the confederation on the $14^{\text {th }}$ of July, and therefore called foderés, and who were alfo lometimes denominated Marfeillsis, from the place from which the greater number of them came. Next to thefe, dependence was placed in the populace of the fuburbs of the capital. The defigns of the republicans were not unknown to the court, and both parties were forming plans of operation. It is haid that the royal party intended that the hing and his family fhould fuddenly leave the capital, and proceed to as great a dillance as the conftitution permitted. The republicans are faid to have intended to feize the perfon of the king, and to confine him in the catte of Vinwenne till a national convention thould decide upon his
fate. Both ahigations are probably true. Lvery motive France. which can intluence the mind of man mult have induced Louis to wilh to be at a diftance from the factious and fanguinary capital. And the fublequent conduct of the republicans authorife us to believe them capable of the worlt crime that was laid to their charge.

Verious charges had been brought forward in the af- La Fayette fembly asaint La Fayctte, and the 8th of Augult was accured and appointed for their difcuffion. In the mean time, on acquitted. the 3 d of Augut, Petion the myor, at the head of a deputation from the lections of Paris, appeared at the bar, and in a folemn fpeech demanded the depoltion of the king. The difcuftion of the accufation againit La Fayette was confidered as a trial of itrength between the parties: he was acquitted, however, by a majority of nearly 200 ; and the republican party, deipairing of carrying their point by a vote of the national aliemoly, refolved to have recourle to infurrection and force.

On the evening of the $9^{\text {th }}$ of Augutt, about 1500 Horrid plot gentlemen, officers of the army, and others, repaired to of the rethe palace, refolved to protect the royal family or to publicans. die in their defence: added to thefe were 700 Swifs guards, with a body of cavalry amounting to about 1002. Mandat, the commander of the national guards, a man who was firmly attached to the conttitution, had procured 2.400 of that body and 12 pieces of cannon, With fuch a force, it bas been generally thought that, by vigorous and fteady councils, the palace, which is a kind of caftle, might have been fuccelsfully defended; and what is now called a revolution might have born the name of a rebellion. Meanwhile the affembly declared its fittings permanent. Petion was at the palace late on the evening of the 9th. Some apprehenfions were entertained, or pretended to be entertained, for his fafety (for the whole of this bufinets was, on the part of the republicans, the mott infernal plot), and a deputation from the afiembly brought him away. At midnight the tocin or alarm bell was founded, and the drums beat to arms through the city. At this inftant a number of the moft active leaders of the republican party affembled, and elected a new common council or commune. The perfons thus irregularly chofen inftantly took poffefion of the common hall, and drove out the lawful members; who, with that weaknefs with which men are apt to flimk from flations of refponfibility in perilous times, readily gave place to the ufurpers. The new commune fent repeated mellages to M. Mandat, requiring his attendance upon important bufinels. He was occupied in arranging the troops in the beft order around the palace; but lufpecting nothing, he went to the common hall, and was there altonithed to find a different aftermbly from what he expected. He was abruptly accufed of a plot to mallacre the people, and ordered to prifon; but as he defcended the ftairs, he was hot with a piftol, and Santerre was appointed in his flead to command the national guard.

On this eventful night no perfon in the palace went to bed. About ix o'clock in the morning of the 10 th the king defcended into the gardens to review the troops. He was received with thouts of $V$ ive le roi, excepting from the artiltery, who ihouted Vize la nation. The king returned to the pulace, and the multitude contimed to collect. The wational guard feemed andetermined about what they were to do, as they affembied in divifions near the palace; and had a fleady refiltance

The royal famly thy for fate'y to the hill of the n.ttiona! af. femu'y.
 would have joined the royal parsy. But towarls cende ovock M. Roderer procurd admitance to the $\mathrm{p}^{\text {a }}$ lace, and toll the kins that amed metitules woe atfembing in hotile aray around the lhanicries; that the national guard was not to be depenaed upon; and that, in cale of refitance, the whole royal family would moit cortain'y be matiatied. He thereture adviled tha king to leek protection in the hall of the national atfembly. With this advice the kin, with his ulual fitcility of temper, was ready to comply; but the queen oppoled with vekemence the humiliating propofal. Bucoming gradually, however, alarmed for the fafcty of her children, the gave her content; and the king and queen, the princels Elizaveth, with the prince and princels royal, went on foot $t$, the hail of the affembly. * I am cone hither (hidid his majelty) to prevent a great crime. Among you, gentlemen, I believe myelf in tafety." By an article of the comititution the attimbly could not deliberate in prefence of the king. The royal family were, therefore, placed in a narrow box feparated from the hall by a railing, where they remained for $1+$ hours without any place to which they couh! retire fur refrethment, escepting a very fmall clulet ad. joining. Hore they fat litening to debate, in whicis the royal character and ollice were treated with wemy math of in ait.

When the king left the palace of the Thuilleries, be unfortunately forgot to order it to be immediately furreadered. He recollected this as foon as he reached the allembly, and lent orders for this purpole; but it was now tou late. The infurgents amounted to about 20,000 effective men. They were drawn up in tolerable order by Weiterman a Prulian, and had about 30 pieces of cannon along with them. The gentlemen within the palace, who had affembled to protect the king's perfon, were now difirited, and knew not what part to act. The commander of the Swifs, M. Affry, was abfent, and the captains knew not what to do ; ant the national guard had no leader in confequence of the death of Mandat. About nine o'clock the outer gates were forced open; and the infurgents formed their line in front of the palace. A bloody combat commenced chiefly between the Mareillois and the Swif. After a brave refitance of about an hour, the Swifs were overpowered by numbers, and gave away. All of them that could be found in the palace were maliacred; fome even while imploring quarter on their knees. Others efcaped into the city, and were protected by individuals. Of this brave regiment, however, only 250 farvi.. ved ; but every human being, even the lowelt fervants found in the palace, were put to death. The Swifs taken prifoners in various quarters were condacted to the door of the affembly, and taken by a decree unser the protection of the itate. But the finguinary muititude inimed upon putting them to intiant desth; and the affmbly would, in all probability, have been unable to protect them, had not the Narleillois interfered in their favour.

The fulperfon of the royal autharity was now decreed, and the nation was invited to elect a Consention to determine the nature of its future government. Oit this uacommon occafion all Frenchmen of 28 years of age wese declared capable of ewecting, and of being elected, deputies to the new national Conventiun. Cons.
minioner were, fine men time, lint out the fanc $F$ : coung to ive to the ammion a the and faveuable acfent it thee od pit ce of the Tomple in the midil of the cits, to remain dicre under a frrict guard ; and all perfors of rath who lat been aracled to them were fe: zed and cenmaited to the different pritorn.

To give an ideat of the temper of the peorle of $P_{a} \ldots$. . . ris at this tilae, it is proper to remath, that it the fame *in th inllant when the multitude with a bloociy furs was maf the fot. . facring the menial lervans in the falace, and could farcely be relaranad from offering wionce to the Suits who were made prituners, they would fuffer no act of pillage to pats unpunihad. Sevoral attempts of this hind were accordingly followed by the intan: death of the crimmals. The plate, the jewe!s, and money found in the Thuilleries were brought to the motional aflembly, and throm down in the hall. One man, whole diels and atpearance belioke extrome poverty, calt upon the table an hat full oi gold-Bat the nimis of thele men were elevated by cathuialim; and they conceived themelves at thi- moment the champions of ifcedom, and objects of terros to the king of the eath.

In the mean time, the fituation of France was ex.c.ic: * tiemely critical, and it appeared rety duatral if the thes whe new convertion would erer be fufiered to whemble hustor. La Fayette had accidentally got fpeedy notice of the eventr of the roth of Augult. He alvited the magiifrates of the tomn of Sedan to imprifon the commitioners from the national affimbly when they thould arrive there; which was accordingly done. He, at the fame time, publihed an addrefs to his amy, calling upon them to lupport the hing and the contlitation; but La fivett. finding that they were not to be depended upon, on the withitraws 19th of Augut he left the camp in the night, accomparam the nied only by his itdff and a few fervants. They took inte and the route of Rochefort in Liege, which was a neutral-haracke. country; but were met by a party of the enems, who took them prifoners, and La Fayette was detained for feveral ycars in Pruffian and Autrim dungeors. The levere ticatment of this man was probably a confiderable error in policy on the part of the allic: His fidelity to his king is very generally admitted; though fome have entertained llrong fufpicions of his baving acted a very bafe part to that unfortunate monard:; ahd in the Britih houfe ot commons he has been calied an atandoried ruffian. The expreflion is certainly too ttrong. IIf errors feem to have been thofe of the head rather than et the heat ; and at all events, he thould have beea protected ty the allies, if for no other reaton than to cricuurage dabequent defertions among the otheers of the republicail army.

To return from this disrefinon. The commiftonere sere foon fet at liberty at sedan, and received with di plaule by the army of la Fayette. Gencral Arthar Dillon at first entered into the lentiments of La Fayctt: but the politic Dumonite divented him from lis purpulc, and by this means regamed his credit with the Jacounts, and was appointed commander in chief. The other generals, Biros, Montefquicu, Kellermioth, at.d Cuntiac, made no oppotition to the will of the nationat aniembly.

Acambhile, the combined armies of Aultria and Puflia had entered France. The Late of Bru inich.

Fraze - : W.i. aicere 50,000 ftrong. General Clairfait had Give him with 15,000 Aullrians, and a confiderable body of Heffians, along with 20,000 Fiench emigrant ; mounting in all to $90,000 \mathrm{men}$. To oppofe thete, Dunurier had only 17,000 men colle cted near the pocint from which the enemy were approaching in Tuxembourg. The French emigrants had given the duke of Brunfwick fuch an account of the ditlracted hate of their own country, and of the pretended difaffeetion of all orders of men towards the ruling faction in P.ris, that no refiflance of any importance was especed. When the combined troops, confifting either of lieady Autrian or Hungarian battalions, or of thole nell difciplined Pruflians which the great Frederick had inured to the beff military difcipline, were reviewed in Germany before fetting out on their march, it is fiid that the fectators, among whom the French caufe was not unpopular, beheld then with anxiety and regret, and pitied the unhappy country againt which this irretimble force was direced. The foldiers and their officers regarded themfelves as departing for a hunting match, or an excurion of pleafure ; and many of the uiful accommodations of an army were ill attended to, fuch as hofyitals, \&c. The beginning of their progrefs into France jullified thefe expectations. Longvy furrendered after a fiege of 15 hours, although well fortified, poffilicd of a garrifon of $3,00 \mathrm{men}$, and defended by $7{ }^{1}$ picces of camnon. The news of this event irritated the alfembly fo much, that they decreed, that, when retaken, the houfes of the citizens thould be razed to the ground ; and, diftrultfu! of the officers of the army, they decreed that the municipal officers of a towa lhould hercafter have power to controul the deliberation of the comncil of war. Verdun was nest fummoned; and here the municipality compelled the governor M. Beaurepaire to furrender. That officer, dilappointed and enraged, thot himfelf dead with a piftol in prefence of the council, and on the 2 d of Sep-

3:6
Alarm at Paris on eiccount of their fucEfis.

The news of this fecond capture, and of the approach of the Prufians, fpread an intlant alarm through Paris. It was propofed to raife a volunteer army, which fhould fot out immediately to meet the enemy. The common council, which was now led by Robefpierre, Danton, Nlarat, and others of the molt fangumary chatader, ordered the alarm-guns to le fired, and the populace to be fummoned to mett in the Champ de Mars to enroll themfelves to march againt the enemy. The people affembled, and either in confequence of a premeditated plan, or, which is not very probable, of an inllantaneous movement, a number of voices exclaimed, that " the domettic foes of the ration ought to be deftroyed before its forcign enemies were attacked."

Partie, of armed men proceeded without delay to tle prifon where the non-juring clergy, the Suifs offi- cos, ard thofe confined fince the 1 th of Auguit on account of practices againft the flate, were detained in cuitody. They took out the prifoners ene by once, wase them a hind of mock trial before a jury of themteives, acquited tome fer, and murdered the reft. Among the cie latl was the fircefs de Lamballe. She wa taken from her bed re his bloody tribumal, and matacred; her head

1 by the populace to the 3 cm ? c, to be feen t en, whofe friend the was.

Thefe madiacres lafted for two days, and upwards of 1000 perfons were put to death. There is icarce any thing in hifory that can be reprefented as parallel to them; they were committed, it is faid, by lefs than 300 men, in the midlt of an immente city, which hacard of them with borror, and in the vicinity of the national :ffenably, which, by going in a body, could have fut an end to thom. But fuch was the confution and difmay of thele two difgraceful days, that no man dared to flir from his own houfe; and every one belisved that the whole city, excepting his own itreet, was engaged in maffacre and bloodihed. The mational geards were all ready at their refpective potis, but no man directed them to act : and there is too much reafon to fulpect that Santerre and the chiefs of the commune connived, at lealt, at the tranfaction.
In the nean time, General Dumourier was tahing State of the befl meafures to protract the march of the enemy the French till the army of Kelierman, confifting of 20,000 men, army, and could join him from Lorraine, and that of Buurnonvlle conduct of from Flanders, anounting to 13,000 ; together with rier whatever new levies Luckner might be able to fend him from Chalons. The foreft of Argome estends from north to fouth upwards of 40 miles ; it lay directly in the route of the duke of Brunfwick, who mult
either force his way acrofs it, or make a circuit of ly in the route of the duke of Brunfwick, who mult
either force his way acrofs it, or make a circuit of 42 either force his way acrofs it, or make a circuit of 42
miles by the pafs of Grandpré on the north, or by Barleduc on the fouth. The pafs that lay directly in his route was that of Biefme. After furveying Dillon's route was that of Biefme. After furveying Dillon's
pofition here, he left a party of 25,000 men to wateh it ; and with the main body of his army took the circuitous rout by Grandpré on the north. Here Du-Prufmourier waited to receive him, and was attacked on the fians oblige 12 th and 13 th without fuccels: but on the 14 th, the him to reattack of the Pruflians was irrefirtible, and Dumourier treat, but retreating, gave up the pafs. On his march he was fo low not
violently prefied by the advanced cavalry of the Pruf- their adretreating, gave up the pafs. On his march he was fo do not up
violently preflied by the advanced cavalry of the Pruf-their adfians, that his army, at one time, was feized with a pa-vantage. nic, and fled before 1500 men; who, if they had pulthed their advantage, might have difperfed it. On the ed their advantage, might have ditperled it. On the
15 th, however, Dumourier encamped at $S t$ Menehould, and began to fortify it. Bournonville's army joined
Dumourier on the 17 th. The duke of Brunfick and began to fortify it. Bournonville's army joined
Dumourier on the 17 th. The duke of Brunfixick rormed a plan of attaching Kellerman before his junction could be completed. That general arrived on the 19th within a mile of Dumourier's camp; the project19th within a mile of Dumourier's camp; the project-
cd attack took place; the Pruffians manouvred with their ufual ccolnefs and addrefs; they attempted to furround Kellerman's amy, but this could not be aclurromd Kellerman's army, but this could not be ac-
complifhed. The French troops preferved excellent order, while the national vivacity was conftantly fhowing itfelf in their thouts and patriotic fongs: 400
French were killed, and 500 wounded; the lots of ing itfelf in their thouts and patriotic fongs: 400
French were killed, and 500 wounded; the lofs of the Pruffians was much greater : and, in the face of the enemy, Kelierman joined Dumourier at the end of
the engagement without oppofition. At the time that the enemy, Kelierman joined Dumourier at the end of
the engagement without oppofition. At the time that the attack was made on the army of Kellerman, an attempt was made to force Dillon's camp at Bieflime by the $=0,000 \mathrm{men}$ that had beea left in it, vicinity, but the $=0,000 \mathrm{men}$ that had beea left in it, vicinity, but
without fuccefs; and this large detachment was thus prevented from crolling the forct of Argonne and joining the duke of Brunfivick. It is to be obferved, that
in thefe engagements the French owed their fuperiority ing the duke of Brunfiwick. It is to be obferved, that
in thele engagements the French owed their fuperiority chichly to the excellence of their artillery ; a circumflance which ferved to convioce their enemies that they

fians di-
ftrefled by fickne is and ismine.

Fad to contend with regular military bodies, and not with undifciplined multitudes, as they experted.

The duke of Brunfwick encamped his army at La Lun, near the camp of Dumourier. And here the Pruffians began to be in extreme ditrefs both from ficknels and famine. No temptation could induce the inhabitants of the country to carry provitions to the hottile camp, while at the fame time the French army was abundantly fupplied.

Bournonville, with a body of $4 \subset 00$ men, intercepted feveral droves of cattle and other convoys of provifions dettined for the Pruffians. The rain fell in torrent, and the roads were uncommonly deep. Expofed to the cold, the moilture, and want of provitions, the Pruifians rahly ate great quantities of the grapes of Champagne. The confequence of this was, that an epidemical dilemper commenced and Epread through the army to fuch an extent, that 10,000 men at one time were unfit for duty. The duke of Brunfwick, however, till commanded a firce much more numerous than that of Dumourier ; and he has been much cenfured for not attacking his camp, and forcing him to engage. It has been faid that the veteran and numerous force which he commanded would have marched to certain victory againt the raw troops that oppoled them ; that, having defeated Dumourier's army, there was nothing to oppole their march to Paris. But the duke of Brunfwick had entered France upon the fuppolition, that in its prefent diftracted ftate no regular army could be brought into the field againit him, and that the people at large were hoftile to the ruling faction. The contrary of all this had turned out to be truc. He found himfelf in the midit of an hottile people, and oppoled by ikilful military chiefs. A defeat in fuch a fituation would have brought certain ruin to his army; and even the lols futtained in the acruifition of a victory might have proved equally fatal. The remains of the French army would not fail to hang upon his rear ; and from the difpofition of the people it appeared impolfible to afcertain to what amount that army might be fuddenly increafed. After propofing a truce, therefore, which lafted eight days, he commenced his retreat towards Grandpré, and no advantage was gained over him in the courfe of it. Verdun was retaken by the French on the 12 th of Oitober, and Longry on the 18th; the fiege of 'Thionville was at the fame time raifed. That [mall, but 4 rong fortrefs, under the cormmend of General Felix Wimpfen, had held in check an army of 15,020 men.

While the Pruffians were advancing from the north. eaft, the Auftrians under the duke of Saxe Tetchen laid fiege to Lille. The council-general of the commune anfwered the fummons of the belicgers thus: "We have juft renewed our oath to be faithful to the nation, and to maintain liberty and equality, or to die at our pot. We will not perjure ourlilies." Such was the cant of thefe men who had already perjured themfelves by contributing to overturn the conntitution which they had repeatedly foorn to defend. The Autrian batteries began to play upon the town on the $z y: h$, and were chiety directed againf that quarter which was inhabited by the lower clais of citizens, for the purpofe of mahing them mutinous and leditions. This procedure was ill judged. The loner clatlies of matakind are alvays much accuftomed to hardhips, and they go farthett in

Theie two fartic howed the diverfity of their characters in the manner in which they treated the manacres of the ad and $3^{4}$ of September. The Brifotine, with the majurity of the comestion, wilhed to bring the marlener, to tial ; but the puethion was olwat chaled by the cther prex, wh the allatance of the Jaccbia clut and of the popatace.
It was foon difcovered that the leading republicans hat diviled into two oppofite factions. The one of thete was called Girondyb, becaule Vergniaud, Genforice, Guadet, and fome others of its leaders, were memwhe in the Hrated Comborcet belonged to this pary; and they "ere

On the $9^{\text {th }}$ of Otober it was decrecel, that all emi grant, when taken, haseld fuffer death; and on the 15 th of Nowerber, in conlequence of an inforrection in the duchy of Deux Pent, and an application on the part of the infirgent to the conventinn for ant, the following decree was pafied: "The national consention declare, in the mame of the French mation, that they will grant tratemity and affitance to all thole people who wilh to procure liberty; and they charge the cecutive power to fend orders to the: generah so sive allitance to fuch people a, have fuffered, or are now fuftring, in the caulic of l" erte." Oi this decree furem nations, with great reatu, comphed much, as will dortly appear.

To retum to the nilitary affairs of the new repul) lic. On the 1 th of October Gencial Dumomies came to Paris, and was if ecelily fent to commence a witter campaiga in the Netherlands. He foldenly attached the Auntrian at the village of Boffu, and drove them from their around. Wo the $5^{\text {th }}$ of Nuvember he reme in figit of the eneny upon the haishts of $\mathrm{fe}_{\mathrm{e}}$ mafor: Thee row of fortification arofe whove cach other, defenien ty 100 ieces oicmmon. Their right was cosered by the sillage and a river, and their left by thick woods. The French were by their uwn account 30.000 , whint others with great pr bathlity of touth compute them at douhbe that number, and the number of the Autfimess wa at leait 20,000. At feven in the morning of the following day a heary canmande commenced ona both fibee, and at noon a clofe attigck was determined on by the Frach, whofe righe wi.g. wen wamanded by Generals Bumonvite and Damicme sud the centre by Generals besalite (Gon to the duke of Oleans who had affume that mane), Stetenbotic, Detpores, and Drouet. The mufic played the popular match of the Marfellcis, and the foldiers rathed on with cuhbufuf, thoutine "Vive I. nation." The en-
gagement was warm and bloody; the Frencls rwere
twice repulicd; but their impetuofity was at laft irrelintible, and about two o'clock the enemy fled from
1792. their lait entreachments. The lots on both fides was very great, that of the Aultrians amounting to 4000 . This victory was decitive of the fate of the Netherlands. Mons and Bruliels furrendered to Dumourier; Toumbay, Malines, Gbent, and Antwerp, were taken poffeffion of by General Labourdomayc: Lourain and Namur were taken by Gencral Valence; and the whole Aultrian Netherlands, Lusembourg only excepted, fell into the hands of the French: Liege was tiken on the 28th of November ifter a lucceisoul equagement, in which the Aultrians loft 5 or 600 men and an immenfe train of artillery.

France was now in a fituation not whefual in the lii- vialent flory of thofe natious that cither are fice, or are at-contefts hetempting to becume io; fuccelsful in all owarters abroal, $\frac{\text { twean the }}{\text { Girondift }}$ but diftracted by factions at home. The two 1 arties Girondif in the coavention were engaged in a thuggle, which arountain. daily became more implacathe. The farty catled the AIonntain did not hefliate about the nature of the mears they were to tmploy to bring about the ruin of their autagoniths. Thev are even fufpected of having, through the medium of Pache the war-minifter, retarded the fupply of the amies, to render the roling party odion by want of fuccefs. They were for fome timic, however, unfortenate in this refpeat; and the dilly new of vietories fupported with the public the ciclit of the Girondifts. A new fubject was therefore falit: upor, which was the queftion, how the dethroned king was to be dififofed of? The moderate paty wilhed to fave. him; and this was a fufficient rcalun for their antagonifts to refolye upon his ruin. A committee was arpointed to give in a report upon his conduct. A $\therefore .$. ricty of accultions were brought againt him; and the convention infamouly refolved to wet the part of acculirs and of judges.

It was on the ith of December when the ill-fated The hire monarch was ordered to the bar of the convention : the brought to aet of accufation was read, and the king was fummon- tial. ea by the prelident, Barrere, to aniwer to each fepurate charsc.

Prof. "Louis, the French mation accufes you of having committed a multitude of crimes to ellablifh your tyranny, in dellroying her freedom. You, on the 20 th of lune 1789 , attempted the lovereignty of the people, by fuipending the afimblien of their itprefentatives, and expelling them with violence from the places of their fittings. This is proved in the procefs verbal entered at the Temi-court of Volailles by the members of the coratituent afinmbly. On the 23 d of june you wanted to diclate laws to the mation ; you lurrounded their reprefentatives wids troops; you prefented to them two royal declarations, fulverfise of all hibaty, and ordered tha mol leparate. Your own declanations, wid the mintes of the aftembly, prove the fe attempts. What have you to ansor?"

Louis. "No laws wie then exilling to prevent me from it."

Prof" "You ordered an army to mark againt the citizens of Paris. Your latelitios have thed the blood of feveral of them, and you would not remove this army till the taling of the batfile and a general infurrection sarounced to you that the peripic nere victorious. The ipecthe:

## FRA $\quad$ [ 139$] \quad \mathrm{F}$ R A

Frasce. fpeeches you made on the $9^{\circ h}$, $12 \mathrm{t}^{h}$, and t th of July to the deputations of the contituent aifmbly, thew what were your intentions ; and the maflacres of tle Thaillerie, rife in evidence agand you.- What have you to athmer :"

Louis. "I was maiter at that time to order the imps to march; but I never had an intention of thedsing blood."

Prol. "After thefe events, and in fite of the promifes whin you made on the 1 th in the contituent aliembiy, and on the $17^{\text {th }}$ in the tom-houfe of Pari-, you have perfited in your projects againtt national liberty. vor long eluded the evecution of the decrees of the Irth of Auguf, reliecting the abolition of perfonal fervitude, the feudal govermment, and tythes: you long refafed acknowledsing the rights of man: you soubled the number of the life-guards, and called the r"jiment of Flanders to Verfailles ; you permitted, in orgics beld before your cres, the national cockade to Ao trumoled under foot, the white cockade to be hoilt. ed, and the mation to be llandered. At latt, you rena . ad neceffary a freh infurrection, occafioned the death of iveral citicens, and did not change your language till dfter your guards had been defeated, when you renewed your perfdious promifes. The proofs of thefe tact, are in your obervations of the 1 Sth of Septemher, in the decrees of the 1 Ith of Augutt, in the minutes of the confituent affem ${ }^{13}$ y , in the events of Verstiles of the 5 th and 6 th of Ottober, and in the convertation you had on the fame day with a deputation of $\therefore$ : conitituent alfembly, when you told them you would taighten yourfelf with their councils, and never receje from them. What have you to anfwer ""

Louns. "I have made the obfervations which I thought juft on the two firit heads. Is to the cockade, is is falle; it did not happen in my prefence."

Pri/. "Yoa took an oath at the federation of the ifth of July, which you did not keep. You foon tried to corrupt the public opinion, with the afliftance of Talon who atted in Paris, and Mirabeau who was i. have excited counter-ret olationary movements in the provincer- - illat have you to anfwer:",
L.n. "I do not know what happened at that time; but the whole is anterior to my acecptance of the conititution."

Pref. "You lavihed milkions of money to effect this corruption, and you would even ufe pepu'arity as a means of enlaving the people. Thefe faets are the refult of a memorial of Talon, on which you have made your marginal comments in your own hand-writing, and of a letter which Lepporte : rote to you un thee 1 th ot Apri!; in which, recapitulating a convertation be had with Rivarol, he told fou, that the millions which you lad been prevailed upon to throw away hal becn productive of nothing. For a long time vor bad meditated on a plan of ficape. A memoriaj :as delivered to you on the 2 Sth of Febraars, which pointed out the means for you to effect it ; you approve of it by :narginal note.-What have you to anlwer ",

Lourir. "I ielt no greater plealure then that of reVeving the needy : this prover no detion."

Prel. "On the 28 th a great number of the nobles and military came into your apartments in the calle of the Thuilleries to favour that efcage: you wanted to
nuxit Paris on the $1=t h$ of April to go to St Cincd. What have you to anfuer :"

Lomer." This aceuftion is absfan!."

## F R A [ Ifo ] F R A

$P_{r}$. " Arles had hoifted the ftandard of rebeltion; you fasoured it by fending three civil commiffaries, who made it their bufmefs not to repreis the counterrevolutionits, but to juttify their proceedings.-What have you to antiver?"

Lus. "The inltructions which were given to the commiffaries mull prove what was their mifion; and I knew none of them when the minifters propofed them to me."

Pref. " Avignon, and the county of Venaifin, had been united with France; you caufed the decree to be executel; but a noonth after that time civil war defolated that country. The commiffaries you fent thither helped to ravage it.-What have you to anfwer ?"
Louic. "I do not remember what delay has been eaufed in the evecution of the deeree; befides, this oceurrence has no perfonal reference to me; it only concerns thofe that have been fent, not thofe who fent them."

Pref. "Nimes, Montauban, Mende, Jales, felt great thoch's during the firft days of freedom. You did nothing to ditie thole germens of counter-revolution till the moment when Suillant's confpiracy became manifellly no-toricus.-What have you to anfwer?"
Louis. "I gave, in this refpect, all the orders which were propofed to me by the miniters."

Pref. "You font 22 battalions againft the Marfeillois, who marched to reduce the counter-revolutioniits of Eirles.-What have you to antwer?",

Louis. "I ought to have the pieces referring to this matier, to give a juft andiver."

Pref. " You gave the fouthern command to Witgentein, who wrote to you on the 211t of April 1792, After he had been recalled: ' $A$ few inltants more, and I inall call around the throne of your majelly thoufands of French, who are again become worthy of the willes vou form for their happinef.' - What have you to anFer"

Luis. "This letter is dated fince his recall; he has not been employed fince. I do not recollect this letter."

Pref. " You paid your late life-guards at Coblentz; she regiters of Septeuil attelt this; and general orders figned by you prove that you fent confiderable remittances to Bouillé, Rochefort, Vauguyon, Choifeul, Beaupre, Hamilton, and the wife of Polignac.-What have you to anfwer ""

Louls. "When I firft learned that my life-guards affentled beyond the Rhine, I thopped their pay : as to the relf, I do not remember ?"

Pref. "Your brothers, enemies to the fate, caufed the emigrants to rally under their banaers: they raifed regiments, took up loans, and concluded alliances in your name: you did not difclaim them; but at the moment when you were fully certain that you could no bonger crofs their projects, your intelligence with them ty a note, viitten by Louis Stanillaus Xavier, figned by your two brotbers, was conceived in thefe words:
' I wrote to you, but it was by polt, and I could fay nothing. We are two here, who make but one; ohe in lentiments, one in prineiples, one in zeal of fervias you. We heep filence; beeaufe, were we to breah it too foon, it would injure yon : but we ihall tpeak as foon as we thall be eertain of gencral fupport, and that momont is near. If we are frokeis to on the
part of thofe people, we fhall hear nothing; but if on your part, "e will liflen: we fhall purfue our road itraight. It is therefore defired that you will enable us to fay fomething. Do not ftand on ceremonies. Be eafy about your fafety : we only exift to ferve you; we are eagerly occupied with this point, and all goes on well; even our enemies feel themfelves too much interefled iu your prefervation to commit an ufelefs crime which would terminate in their own deliruction.
'L. S. Xavier and
'Charles Philippe.'
" What have you to anfwer ?"
Louis. " I diowned all the proceedings of my brothers, according as the conftitution preferibed me to do, and from the moment they eame to my knowledge. Of this note I know nothing."

Pref. "The foldiers of the line, who were to be put on the war eftablifhment, confifted but of 100,000 men at the end of December, you therefore neglected to provide for the fafety of the flate from abroad. Narbonne required a levy of 50,000 men, but he itopped the recruiting at 26,000 , in giving affurances that all was readly; yet there was no truth in thefe aflurances. Servan propofed after him to form a camp of 20,000 men near Paris; it was decreed by the legillative allembly; you refufed your fanction.-What have you to anfwer :"

Louis. "I had given to the minifters all the orders for expediting the augmentation of the army : in the month of December lalt, the returns were laid before the affembly. If they deceived themfelves, it is not my fault."

Pref. " A flight of patriotilm made the citizens repair to Paris from all quatters. Iou iflued a proclamation, tending to ftop their march; at the fame time our camps were without foldiers. Dumourier, the fucceffor of Strvan, declared that the nation had neither arms, ammunition, nor provifions, and that the polts were left defencelefs. You waited to be urged by a requeft made to the minifter Lajard, when the legillative affembly wifted to point out the means of providing for the external fafety of the ftate, by propofing the levy of 42 battalions. You gave commiffion to the commanders of the troops to difband the army, to force whole regiments to defert, and to make them pafs the Rline, to put them at the difpofal of your brothers, and of Leopold of Aufria, with whom you had intelligence. This fact is proved by the letter of Toulougeon, governor of Franche Comte.- What have you to anfwer ?"

Louis. "I know nothing of this circumfance; there is not a word of truth in this charge."

Pref. " You charged your diplomatic agents to favour this coalition of foreign powers and your brothers againt France, and efpecially to cement the peace between Turkey and Aultria, and to procure thereby a larger number of troops againft France from the latter. A letter of Choifeul-Gouffier, ambaffador at Conftantinople, verifies the fact.-What have you to anfiver ""

Louir. "MI. Choifeul did not fpeak the truth: no fuch thing has ever been."

Prof. " The Pruffians advanced againf our frontiers: your minitter was fummoned on the 8th of July to give an account of the itate of our political relations

Irance
aveiturned the French monarchy. Almoft all the men of property in the kingdom concurred with the minilly i: thinking a war with France neceflary for the purpofe of fecuring the conftitution at home. After the both of Augut the Britith miniter had been recalled; but the new republic 1 li!l fuffered the former ambaft dor from France, M. Chauvelin, to remain in England.

The oitenlible grounds of quarrel on the part of Great Britain were chiefly two; the decree of the 1 sth of November 1792, by which it was truly obierved thet encouragement to rebellion was held out to the fubjects of every thate, and that war was thereby waged againft every eltablihed government. Of this decree the French executive council gave explactions, denying the fairnefs of the interpretation put upon it, and alleging, that the intention of the convention was only to give aid to fuch countries as had alroady acquired their freedom, and by a declaration of the general will requetted aid for its prelervation. But this explanation cannot be admitted. The decree exprefily fays, that the French nation willgrant affi/lance to all who wi/b to procure liber$y$; and when it is confidered what their notions of liberty are, it cannot be doubted but that their intention was to excite rebellion in foreign nations. The lecond noint of difpute referred to the opening of the Scheldt. This river runs from Brabant through the Dutch territory to the fea. The Dutch had thut up the mouth of it, and prevented any maritime commerce from being carried on by the people of Brabant by means of the river. To render themfelves popular in Brabant, the French had declared, that they would open the navigation of the Scheldt. But Great Britain had fome time before bound herfelf by treaty with the Dutch to affitt them in obthructing this navigation, and now declared to the French, that the project of opening the Scheldt muft be renounced if peace with Great Britain was to remain. The French alleged, that by the law of nations navigable sivers ought to be open to all who refide on their banks; hut that the point was of no importance either to France or England, and even of very little importance to Holland; that if the people of Brabant themfelves thole to give it up, they would make no objection. It has been thought remarkable, that the Dutch gave themfelves no trouble about the matter. They did not alk the affiftance of England; and with that coolnefs which is peculiar to their character, the merchants individually declared, that if the Scheldt was opened, they could manage their commerce as well at Antwerp as it Amfterdam. But in all this there is nothing Alrange. Among the Dutch were many republicans, who wihed for the downfal of the ftadtholder. Thefe rejoiced at every thing which diftrefled him, or had a tendency to render his office ufelefs in the eyes of the people. Others, who thought differently, were afraid to fpeak their fentiments, as Dumourier was in their neighbourhoud with a victorious army. The refult of the whole was, that M. Chauvelin was commanded by the Briaifh government to leave this country. 'The
$34^{8}$ War declared ageintt the king of Eng'and and ftadtholder of 3olland, French executive council gave powers to another minifter, M. Maret, to negociate, and requelled a paffport for him; but he was not fuffered to land. The haushty republicans having thus far humbled themelves before the Britilh government, at laft, on the nft of February 1793 , on the motion of Britiot, the national convention decreed, among other article, that "Gcorge king of England had never ccafed fince the revolution
of the $12 t^{2} .1$ of - lugut 1792 from giving to the Trench nation proofs of his attachment to the concert of crowned heids; that he had dramn into the fame 1793.

Frarre. lake the $1 \mathrm{t}:$ dtholder of the United provinces; that, contuary to the treaty of 1783 , the Englifh minitty had ganted protection to the emigrants and others who have ovenly appeared in arms againft France; that they have committed an outrage againtt the French reputlic, by ordering the amballador of France to quit Great Britin ; that the Englifh have fopped divers boats and veflels laden with corn for France, whilf, at the fume time, contrary to the treaty of 1786 , they continue the exportation of it to other foreign countries; that to thwart more efficacioufly the commercial tranfactions of the republic with England, they have by an act of parliament prohibited the circulation of aftignats. The convention therefore declare, that in confequence of thele acts of hulility and aggreflion, the French republic is at war with the king of England and the ftadtholder of the United Provinces.

The abfurdity of pretending that any treaty with France made in 1783 could be violated by protecting the emigrants who tled from the fury of the convention, mut be obvious to every reader. The convention was itfelf a rebellious ufurpation of the government with which fuch a treaty was made. The prohibition of alfignats was certainly contrary to no law, and was fanctioned by every motive of expediency, unlefs the convention could prove that all nations were bound by the law of nature to rifk their own credit upon the credit of the French republic.

About a fortnight after this abfurd declaration againft And again!t Britain, war was likewife declared again? Spain; and Spain. in the courfe of the fummer France was at war with all Europe, excepting only Swifferland, Sweden, Denmark, and Turkey.

In the mean time General Dumourier, who was pro- Progreis of ceeding agreeably to his orders, made an attack upon Dumourier. Holland; but in doing this he difpurfed his troops in fuch a manner as to expofe them much to any attack on the fide of-Germany. He commanded General Miranda to inveft Maefticht, while he advanced to block up Breda, and Bergen-op-zoom. The firft of thefe places, viz. Breds, furrendered on the $\mathbf{2} 4^{\text {th }}$ of February ; Klundert was taken on the 2 G th ; and Gertruydenberg on the $4^{\text {th }}$ of March. But here the triumphs of Dumourier ended. The ficges of Williamftadt and Bergen-opzoom were vigoroufly but unfuccefifully preffed. On 335 the ift of March General Clairfait having paffed the feated. Roer, attacked the French polts, and compelled them to retreat with the lofs of 2000 men.

The following day the archduke attacked them anew with confiderable fuccels. On the ad we French were driven from Aix-la-Chapelle, with the lofs of 4000 men killed and 1600 taken prifoners.

The fiege of Maeltricht was now raifed, and the French retreated to Tongres, where they were alto attacked, and forced to retreat to St Tion. Dumourier here joined them, but did not bring his army along with Fim from the attack upon Holland. After fome \{kirmihes, a general engagement touk place at Neerwinden. It was fought on the part of the Fiench with ereat obilinacy; but they were at length overpowered by the number of their coemics, and perhaps ailu by the treachery of their commander. This defeat was fatal. The French lon 3000 men , and 6000 immediately

## $\mathrm{F} R$ A $[1+5] \quad \mathrm{F}$ i 1

France. immediately delerted and went home to France. Dumourier continued to retreat, and on the $22 d$ he was again attacked near Louvain. He now, through the medium of Colonel Mack, came to an agreement with the Imperialifts that his retreat hould not be feriouily interrupted. It was now fully agreed between him and the Imperialints, that while the latter took poffeffion of Conde and Valenciennes, he thould march to Paris, diffolve the convention, and place the fon of the late king upon the throne.

The rapid retreat and fucceffive defeats of General Dumourier rendered his conduct fufpicious. Commiffioners were fent from the executive power for the purpofe of difcovering his defigns. They diffembled, and pretended to communicate to him a fcheme of a coun-ter-revolution. He confeffed his intention of diffolsing the convention and the Jacobin club by force, which he laid would not exit three wecks longer, and of reItoring monarchy. On the report of thefe commiffioners the convention lent Bournonville the miniter of war to fuperlede and arreft Dunourier, along with Camus, Blancal, La Marque, and Quinette, as commiffioners. The attempt on the part of thele men was at lealt hazardous, to fay no more of it ; and the refult was, that on the firit of April Dumourier fent them

bathearmy t tufe to ast with him.

354
Froclamations of the Imperial commande in chief. prifoners to General Clairfait's head quarters at Tournay as hottages for the fafety of the royal family. He nest attempted to feduce his army from their fidelity to the convention; but he fpeedily found that he had much mitaken the character of his troops. Upon the report that their general was to be carried as a criminal to Paris, they were feized with fudden indignation; but when they found that an attempt was making to prevail with them to turn their arms againtl their country, their fentiments altered. On the 5 th of Antil two pruclamations were iffued; one by General Dunouicr, and the other by the prince of Saxe Cobourg, declaring that their only purpote was to reftore the contitution of $17^{8} 9,179^{5}$, and 1791 . Prince Cobourg amounced that the allied powers withed merely to co-operate with General Dumourier in giving to France her conAitutional king and the contitution the had formed for herfelf, declaring, on his word of bonour, that he came not to the Freach territory for the purpofe of making conqueits. On the fame d:y Dumourier went to the advanced guard of his own camp at $\mathrm{M}_{\text {uld }}$. He there learned that the corps of arthlery hod rifen upon their general, and were marching to Vialmiemes; and he foon fourd that the whole army had determined to ftand by their country. Seven hundred catairy and 800 infantry was the whole amount of thol- t.at deferted with Dumourier to the Auttians, and many of them afterwards returned.

[^4]Nout the miduh of March they adv ced azaint Fr
Nantz to the amount of $4 z, 2=2$. In the beginning of April they defeated the republicars in two pitched $1: 92$ battles, and poffetied themtelver of 5 s learuts of conan
 thake the new repubic to it, foundorion. Ot the $8: h$ of April a congrels of the combinal perate atembled at Antwerp. It wasattended by the prime of Orange pan a and his two fons, with his excetioncy Vander Sajegel, on the part of Hollmd; by the duke of Vuth ai,! Lord Auckiand on the purt of Gacat Eriam ; y the prince of Sase Coboury, Counts Mettanch, Siaten berg, and Mercy Dargenteau, with the Pruffar, Spanith, and Neapolitan envoy. It wa, here cetermined to commence active operations againt Erance. The prince of Cubourg's proclamation was recalled, and a fcheme of comquett announced.

Commifioners from the convention now het up the Tan rifns. ftandard of the republic anew, and the fcattered bat- waty talions flocked around it. General Dempierre was ap- mo! d. pointed commander, and on the $13^{\text {th }}$ he was able to refift a general attack upon his advanced polts. On the $1 \mathrm{q}^{\text {th }}$, his advanced guard yielded to fuperior numbers, but on the 15 th was victorious in a long and well-fought battle. On the 23 d the Aultrians were again repulfed, and on the it of May General Dampierre was himfelf repulfed in an attach upon the enemy. On the 8th another engagement took place, in which the French general was killed by a cannon ball. On the 23 d a very determined attack was made by the allies upon the French fortified camp of Famars, which covcied the town of Valenciennes. The French were overcome, and in the night abandoned their camp. In confequence of this the allies were cuabled to commeace the fiege of Valenciennes; for Condé had been block aded from the ift of April.

About the fame time General Cultine on the Rhine made a violent but unfuccefsful attack upon the Pruffians, in confequence of which they were foon enabled $55^{9}$ to ly hege to Mentz. The Corfican general Paoli Revit ui revolied at this period; and the new republic, affaulted Psoli. from without by the whole itrength of Europe, was undermined by treachery and faction within.

While the country was in a ftate verging upon utter $5 \cdot a \cdot$ of ruin, parties in the convention were gradually waxing pirtle- :t more fierce in their animotity; and regardlefs of whar Fran er was pafling at a ditlance, the leemed only anxious for tionary mthe extermination of each other. In the month of .. e.isMarch, the celebrated Re: Altionary Trolural was elta- h....ies. blithed for the purpofe of tying crimes committed aFsil.t the itate ; and the Girondilt party, the mildnefs of isfore dominitration had contributed not a little to increate the evils of their country, began to fee the necetiity of adopting nee:fures of leverity. But the public calamitice, which now rapidly followed each other in fuccetion, were afcribed by their conntrymen to their imbecility or pertidy. This gave to the paste of the Meuntain a fatal advantase. On the ${ }^{5}$ the of A ril the communces of the $f^{4}$ fections of laris pretened a petition, reguising that the chicts of the Girondits therein named thould be in eached and expelted foan the convention. This was folloncal up on the $t$ it of May by another petition from the Liburb of St . L "...nte. Thi Gironditt party in the mean time impeach d Mawat, hut he wan acquitud by the jury at his tr:
$T$ Muntai:

## F R A [ i46 ] F R A

Frate. Mountain, by the affiftance of the Jacobin club, had now acquired a compitete afcendancy over the city of Paris. The Girondilts or Brifotines propofed therefore to remuve the convention from the capital ; and to prevent this, the Mountain refolved to make the fime ufe of the feople of the capital againt the Girondit party that they had formerly dome againit the monarch on the soth of Auguf. It is unecellary to fate in detail all the tumults that occurred either in Paris or in the convention during the remaining part of the month of Muy. On the int at four oclock in the morning, the tocin was fomided, the generale was beat, and the :hazm gens fixt. All was commotion and terror. The citizens fiew to ams, and affembled round the convention. Some deputations demanded a decree of accufation againf 35 of it members. The day, however, was fpent without desifion. On the afternoon of the ilt of June an armed force made the fame demand. On the $2 l$ of Jume this was repeated, the tocin again founded, and an hundred pieces of cannon furrounded the rational hall. At lat Berrere mounted the tribune. He was confidered as a moderate man, and refyected by buth parties; but he now artfully deferted the Gitondils. He invited the denounced members volutarily to refign their character of reprefentatives. Some of them complied, and the prefideat attermpted to diffive the fitting; but the members were nuw impaifoned i:s their own hall. Henriot, commander of the armed force, compelled them to remain; and the obnosious deputies, amonnting to upwards of 90 in number, were fut under arrelt, and a decree of denunciation againt them figned.
It is obvious, that ou this occafion the liberties of France were trodden under fout. The minority of the national repreientative, by the affittance of an armed force railed in the capital, complled the majority to fubmit to their meafures, and took the leading members paitoners. Thas the city of Paris aflumed to itfelf the whole powers of the French repubic; and the nation rias no loaser governed hy repuetentatives freely choten, but by a mimority of their membere, whofe ientiments the city of Paris and the Jacobin club had thought fit to approve of. Human hitory is a mals of contradictions. The Mountain party came into power by preaching liberte, and by violating its fundmental principles. How far the plea of pulitical necefity may excife their conduet, we thall not venture to decide explicitly. Certain it i, however, that they foon commenced, both at home and abroad, a career of the mot terribie chergy that is io be found in the amalh of nations.

The firt whath of their victory in tive capital was calamitons to the republic at large. Bifiot and fome other deputies creapel, ambendeavoned to kindle the flames of civil war. In general, howcver, the intuence of the Jacohin club, ard of its various luanches, was fuch, that the north of France adhered to the convention as it flood; but the fouthern deparments were fpeciity in a flate of rebellion. The department of L.yons delared the Mountain party outlawed. Marfeilts and Touion followed the example of Lyons, and entered into a confederacy, which has fince been kuown by the appellation of Forerol./m. The departments of La Girunde and Calvades broke out into open revoit. In thort, the whole of France was in a flate of violent convalion. Sti!!, however, the enthafentic garibus
of Mentz and Valcnciennes protceted it againft the im- France. mediate entrance of a foreign force, and allowed leifure for one of its internal factions to gain an afcendancy,
1793. and thereafter to protect its independence. In the mean time, the political enthufiafm of all orders of perfons was fuch, that even the female fex did not efcape its contagion. A young woman of the name of Char- Marat murlotte Cordé, in the beginning of July, came from the dered by a department of Calvades to devote her life for what the "oman. thought the canle of freedom :. 1 of her country. She requetted an interview wih Marat, the mot obnoxious of the Mountain party. Having obtained it, and converied with him calmly for fone time, the lidden'y plunged a dagger in his breatt, and walked careleniv out of the houle. She was immediately feized and condemned. At the place of execution the behared with infinite conflancy, houting Fiwe /a respubligue. The remains of RIarat were interred with great iplendor, and the coavention atended his funeral. His farty perhaps derived advantage from the mamer of tis death, as it feemed to fanten the odious charge of affilfination upon their antag onits, and gave them the appearance of fuffering in the canfe of liberty. The truth is, that afalination was fanctioned by both parties under pretence of delending the liberties of the republic.

One of the firit asts of the Mountain junto after The repubtheir triumph was to fimils the republican contitution. lican contiPrevious to their fall, the Girondifs bad brought for- tution fiward the plan of a conltitution, cliefly the work of thie MounCondorcet; but it was never fanctioned by the conven-tain. tion, and was too intricate to be practically ufeful. The new conllitution now framed, which was afterwards fanctioned by the nation, but was never pat in practice, abolithed the former mode of electing the reprefentatives of the people through the medium of clectoral nenemblies, and appointed them to be chofe: immediately by the primary affemblies, which were to confift of from 200 to 620 citizens, earh man voting by hallot or open vote at his option. There was one depury for every 40,000 individuals, and population wes the fole balis of reprefentation. The elections were to t.ake place every year on the it of May. Electoral affemblies were, however, retained for one furpofe. Every 200 citizens in the primary affemblis named one elector; and an affembly of all the electors of the department was afterwards held, which elected candidates for the executive council, or minillry of the republic. The legillative body chole out of all this lift of candidates the members of the excentive council. One half of this comncil was renewed by each leginatu:e in the latt month of the felfion. Every law, after being pafied by the legilative body, was lent to the department. If in more than half of the departments the tenth of the primary affemblies of each did not object to it, it became effectual. Trial ly jury was eilabliilhed. National cenvention might be called for attering the conftitution, and were to be called, if required by the tenth of the pimary afiemblits of each department in a majority of the departments.

The publication of this conflitution procared no fmall degree of applaufe to the convention and the Mountain party. The rapidity with which it was formed (being only a fortnight) feemed to caft a juft reproach upon the flownets of their antagonifts, and it was :"garced :s a proof of their being decidectly ferious

Trare tiou in the care of repubicanim. No regard, how-

Vaicathr-
2.. ever, wis paid to it by the convention, which declared ittelf permanent, nor indeed did it feem polfible to carry it into execution.
We have mentioned that Condé was invelked from the bexinning of April. It did not yield till the $1=$ th of July, when the garrion was to much reduced by thmine and dileare, that out of 4000 men, of which it originally confited, only 1500 wete fit for fervice. The eycs of all Europe were in the mean time fixed upors the liege of Valenciennes. Colonel Moncrieff had contended, that batieries ought immediately to be placed uader the walls without approaching it by regular parallels; out the Imperiai engineer Afr Ferraris afferted, that the work of the great Vauban mult be treated with more refpect; and his opinion was adopted by the rouncil of war. The trenches were opened on the Ith of Junc. Few fallies were attempted by the garriton, on account of the fmallnefs of their number. The irhabitants at frik wihhed to furrender; but the violence of the bombardment prevented their allemWhag or giving much trouble on that head to General Ferrand the govenor. Much of the labour of the fiege confited of mines and countermines. Some of taeie having been fucceisfully fprung by the allies, the town was iurrendered on the 27 th of July by capitulation to the duke of York, who took poffelion of it in behalt of the emperor of Germany. The fiege of Mentz was at the fame time going on. It fuffered much from famine. At la!t, after an unfucceisful attempt by the French army on the Rline for its relief, it iurrendered on the 22d of July.
Tat a.icd ju wers dvided as to their futare pro. coeting.

At the termination of the hegeof $V$ alenciennes it would appear that the allied powers were at a lois how to proceed next. The Autrian commanders are taid to have prefented two plats: The firlt was to penelrate to Paris by the alintance of the rivers which fall into the Seine; the other was to takit advantage of the conilernation occafioned by the furrender of Valenciennes, and with 50,020 lighe troofs to penetrate fuddenly to Paric, while a debarkation thould be made on the coat of Brittany to affit the royalits. The propodal of the Britih miniftry was, however, adneted, which was, to divide the grand army, and to nttack Wett Flander, beginning with the fiege of Dunkirk. Whis determination proved ruinous to the dhles. The French iound means to vanquilh in detail that army, whith they could not enconnter when united.

It has been faid that the duke of York was in fecret correfpondence with Omeron the governor of Laukirk; but the latter was removed befure any atuantage could he taken of his treachery. ()n the $24^{\text {th }}$ of Augut the duke of York attacked and drove the French outpoti, ints the tom, after on action in which the Autrian General Dalton wai willed. A naval armament was expected from Great Britain to co-operate in the iege, buz it did not arrive. In the mean time, a frong republican force menaced the covering army of the :llie:, which was commanded by General Frevtag. He was foon attacked and totally routed. The fiege was railed. The Britith lodt their heavy camon and baggage, with feveral thoufand men; and the conve:ation, believing that their general Houchard could have cut off the duke of York's retreat, tried and executed him for this neglect of duty.
 time unducceftulily atemptad io beficge Canioray and

 terminated for the prefe:口 compaign the harcelis of the alies in the Netherlon.

A confiderable fort of the firenc! army of the noth took a trong purimion mear Matbe", $\because$, watar they were blockaded by Prire: Colouru; Lut us a the 1 sth and 1 oth of U.lober be was reluatenty tacked by the French troups under Gent :l I In: la: who fucceeded Houchard. The Frach lad mow recovered their vigour. They brought ints the field at furmidable train of artillery, in which were many 27 pounders. Commiffoner; from the conveation harangued the foldiers, threatened the fearful, and applauded the brave. Crowds of women, without confufion, went through the rank, diftriuting feirituous liquors in abundance, and carrying off the wounded. The attacks were repeated and terrible on both liles; but the Autrians bid condideadiy the diladvant ge, and Prince Cobourg retired during the night. The French now menaced maritime Flanders. They took Furnes and betieg : Nieuport. A detachment of Britih troops ready to fail to the Wetl Indies were hatily fent to Oilend, and prevented for the pretent the farther progrefs of the French.

Such was the multiplicity of the events that now occurred in France, that it is dithicult to tiate the outlines ot them with any tolerable perfpicuity. We have already mentioned the extenfive diffentions that occutred throughout the republic in confequence of the triumph of the Mountain party on the $3^{\text {ifl }}$ of May. Ihe department of Calvades was tirt in arms againt the convention uuder the command of Geaeral Felix Wimpfen; but before the end of July the infurrection was 367 quieted, after a few dight akirmihes. But the federa-Lyons belim of the cities of Marteilles, Leons, and Toulon, till heged by remained. Lyons was attackerion the 8th of Augut the convedby the conventional troops. Several actions followed, tional which were attended with great lofs both on the parteat.a. of the aflailants and of the belieged. The city wat reduced almolt to ruins; but it leeld out daring the whole month of september. The betieging geteral Kellerman was removed from his command, on accoust of his fuppofed inactivity ; and the city furrendered on the sth of Octuber to General D rppet, a man who had $s^{3 / 3}$ 1ately been a phylician. Such was the rage of party Unretent zeal at this time, that the walls and public buildings of ing harace Lyons were ordered to be dellroyed, and its nume ter of the changed to that of Ville Alfianchie. Many hundreds vi its citizens were dragged to the faffold on accoment of their alleged treafonable reliftance to the conseation. The victurious party, wearied by the linw operation of the fultosine, at lat deftroyed their pritoners in mult:tudec, by firing grape-hot upo them. Such indeed was the unrelenting characker of the Mountain at this time, not only here but through the whole tepublic, that they themfelves pretended not to excule it, but declared that terror was with them the order of tle day.

In the end of July General Cartaux was fent agame the Mar Marfeilles. In the beginning of Augutt he gained eallors of twb. fome fucceffes over the advanced forderalitt troops. Ontel to twb. the $2 f^{\text {th }}$ he took the town of Aix, and the Marfeillois
lubuitted.

fubmitted. But the leading people of the important town and harbour of 'Tonlon entered into a negociation, and fibmitted to the Britith admiral Lord Hood, under condition that he thould preferve as a depolit the town and hipping for Lous XVII. and under the ditvulation that he fhould affin in relloring the conftitution of 1,89 . The fiege of Toulon was commenced by General Cartats in the beginning of September. It continued without much vigour during that and the whole of the fucceeding month. Neapolitan, Spanish, and Englif, troops, were brought by fea to aflif in its deence. ln the begiming of November, General Cartauy was removed to the command of the army in Italy, and General $\operatorname{Dagommier}$ fucceci'd him. General $\mathrm{O}^{\prime}$ Hara arrived with reinforcements from Gibraltar, and twok upon him the command of the town, under a commifion from his Britanite majefly. On the 30 oth of November, the garrifon made a powerful fally to deltroy fome batteries that were erecting upon leights which commanded the city. The French were farpifed, and the allies fucceeded completely in their wbec. ; but, elated by the facility of their conquent, the allied troops ruthed forward in purfuit of the Hying enemy, contraty to their orders, a $1 /$ were unexpectedly met by a frong French force that was drawn out to protect the fugitives. General O'Hara now came from the city to endervour to bring off his troops with regularity. He was wounded in the arm and taken prifoner. The total lofs of the allies in this affair was ellinated at nearly one thoufand men. 'The French had now muttered in till force around Toulon, and prepared for the attack. It was begun on the 19 th of December in the morning, and was chietly directed againt Fort Mulgrave, defended by the Britill. This fort was protected by an entrenched camp, 13 pieces of camon, 36 and 24 pounders, \&c. 5 moitars, and 3000 troops. Such was the ardour of aflault, that it was carried in an hour, and the whole garriton was dellroycd or taken. The allies now found it imponible to defend the place; and in the courfe of the day embarked their troops, after having fet on fire the arfenal and hips. A fcene of - onfufion here enfued, fuch as has not been known in the hiftory of modern wars. Crowds of people of every rank, age, and lex, hurried on board the thips, to aroid the vengeance of their enraged countrymen. Some of the inhabitant; began to fire upon their late athes; others in defair were feen plunging into the fea, making a vain effort to reach the hips; or putting an end at once to their own exiftence upon the fhore. Thirty-one flips of the line were found by the Britith at 'Toulon; thirteen were left behind; ten were burnt; four had been previoully lent to the French ports of Breft and Rowhefort, with 5000 republicans who could not be trufted; and Great Britain finally obtained by this expedition only three thips of the line and five frigates.

On the fide of Spain the war produced nothing of importance ; and in the mountainous country of Piedmont it went on flowly. Nice and Chamberry were ftill retained by the French; but more terrible feenes were acting in other quarters. In La Vendée a moft bloody war was perfilked in by the royalifts. In that quarter of the country the language of the relt of France is little underftood. The people were fupertitious, and
lately been propegated in the ref of the empire. They were chienly headed by prielts, and regarded their caufic as a religious one. Their mole of warlare ufually was, to go on in their ordinary occupations as peaceable citizens, and fuddenly to aftemble in immenfe bands, infomuch that at one time they were faid to amount to 150,000 men. They befleged Nantz and the city of Orkans, and even Paris itlelf was not thonglit altogether fafe from their enterprifes. The war was inconceivably bloody. Neither party gave quarter; and La Vendée proved a dreadful drain to the population of France. On the $28 t h$ of June, the conventional general Biron drove the royalitts from Lucon; and Nantz was relieved by General Beyfler. After fome fuccefs, General Wefterman was furprifed by them, and compelled to retreat to Parthenay. In the beginning of Augult the royalils were defeated by General Rollignol; but on the 1 oth of that month, under Charette their commander in chief, they again attacked Nantz, but fuffered a repulfe. It would be tedions to give a minute detail of this obfcure but cruel war. The royalifts were often defeated and feemingly difperled, but as often arofe in crowds around the aftonithed republicans. At laft, however, about the middle of October, they were completely defeated, driven from La Vendée, and foreed to divide into feparate bodies. One of thele threw itfelf into the ifland of Noirmoutier, where they were fubdued; another took the road of Maine and Brittany, where they ftruggled for fome time againt their enemies, and were at laft cut to pieces or difperied.

The royaliits had long expected affiftance from Eng. land; and an armament under the earl of Moira was artually fitted out for that fervice, but it did not arrive till too late, and returned home without attempting a land-ing.- The Mountain party always difgraced their fuc-Horrid ${ }^{37}$ cefies by dreadful cruelties. Humanity is fhocked, and cruelty of hillory would almolt ceale to obtain credit, were we to the Mounitate in detail the unrelenting cruelties which were exer- tain party. cifed againd the unfortunate royalits, chiefly by Carrier, a deputy from the convention, fent into this quarter with unlimited powers. Multitudes of prifoners were crowded on board veffels in the Loire, after which the vefiels were funk. No age or fex was fpared; and thefe executions were performed with every circumflance of wanton barbarity and infult.

Oa the fide of the Rhine a great variety of event occurred during the months of Augult and September. Several engagements at frilt took place, in which the French were, upon the whole, fuccefsful. In September, however, Landau was invefted by the combined powers; and it was refolved to make every poffible effort to drive the French from the frong lines of Weiffembourg, on the river Lauter. On the 13th of October, the Auftrian general Wurmfer made a grand attack upon thefe lines. The French fay that their generals betrayed them, and fuffered the lines to be tahen almoft without refiftance. The general of the allies confeficd that the lines might have held out for feveral days. The French retreated to Hagenau, from which they were driven on the $18 . \mathrm{b}$; and fuffered two other defcats on the 25 th and 27 th. Some of the principal citizens of Strafbourg now fent a private deputation to General Wurmfer, offering to furrender the town, to be preferved as a depofit to be reffored tor

France. Louis XVII. General Viumfer refudel to accept of it upon thefe terms, infilting upon an abolute farmader to his lmperial Majetty. In confequence of the delay occafioned by difagreement, the negociation was difcorerd, and the citizens of Stationtrg engeged in the piot were fecized by St Jutt and Lcbas, commifionors from the convention, and brought to the faffuld. Irodicious efforts were now made by the French to fecover their bert was thot at the head of the army on the $9^{t h}$ of November, upos a charge, probably ill-founded, of trachery in the affair of the lines of Weiflembours. (1) the $14^{t h}$, however, Fort Louis was taken by the allies, not without fufficion of treachery in the governor. But here the fuccels of General Wurmfer misht be faid to terminate. O;1 the 21ft the republican army drove back the Aulriam, and penctrated almof to Hagenau. An army from the Mofelle now advanced to co-operate with the army of the Rhine. On the 1 -th the Piutians were defeated near Sarbruck. Neat day their camp at Blieicatel was Hommed, and the ${ }^{375}$ French French advanced to Denx Ponts. On the 20th and at leneth, 3 oth the French were repulled with great lols in two duccefful in volent attarks mode on the dike of Bruntivick near that quar- Lautern. But it now appeared that the Frencla had ter.
come into the field with a detemmation to conquer whatever it miget coit. Every day wos a day of battle, and torients of blood wete ilied on both fides. The allifs had the advantage of poffeffing the ground, which, in that quarter, at fuch a late featon of the year, is very ferong on account of its inequalities and moralies. In military Kill, the French olficers and thofe of the allies were perhaps nearly equal ; but the French army was by far the moll numerous; alad although not a match in point of dicipline, yet it derived no fmall fuperiority from the enthufiafm with which the troops were animated. On the 8th of December, under the command of General Pichegru, the French carried the reduabts which covered Higenau by mems of the bayonct.

This modern intrument of deflruction, againtt which no defenlive weapon is emploved, is always mott fuccefsful in the hands of the moll intrepid; and it was now a dreadful engine in the hands of French enthufiafm.The fineit troops that ever Europe produced were unable to withfiand the fury of the republicans, which ficemed only to increafe in proportion to the multitude of companions that they lolt. On the 22d the allie; were driven with immenfe flaughter from Hagenau, notwithftanding the immenfe works they had thrown up for their defence. The entrenchments on the heights of Reithoffen, Jauderflıffen, \&ic. were confidered as more impregnable than thole of Jemape. They nere flormed by the army of the Mofelle and the Rhinc, under Generals Hoche and Pichegru. On the 22 d and $2 q^{\text {th }}$, the allics were purfued to the heights of Vi rotte. On the 26 th, the entrenchments there were forced Ly the bayonet, after a defperate conflict. On the 27 th, the republican army arrived at Weilemboure in triumph. General Wurmier retreated acrofs the Rhine, and the duke of Brunfsick hallily fell back to cover Mentz. The blockade of Landau, which had lafted four months, was raifed. Fort Louis was evacuated by the allies, and Kaiferflatern, Germerheim, and Spire, fubmitted to the French.-During this lait month of the year 1793 , the lofs of men on both fides
in this quarte: was immenfe, and unexampled in the F.... Willery of modern war. It is even lad that it might amourt to more than $7=, 000$ or $\$ 3,000$ men.
1793.

Thu far we have attended to the military affairs of Vienten cf the republic for fome time pall. Very violent efforts firssifthe were in the mean time made at Paris by the new admi- 13 ur tain nifiration, eflablifed under the aupices of the lacolin parts). club, and of the party called the Mustatan. The new republican comitution had been prelented to the people in the primary affemblies, and accopted. The humed, therefore, for whicl the convention was called together, that of forming a conlitution for France, was at an end; and it was propofed that they ihould diffulve themfelves, and order a new legillative body to aflemble, according to the rules preficribed by that conditution. This was, no doubt, the regular mode of procedure; but the ruling party confidered it as hazardous to convene a new aficinbly, poffeting only limited powere, in the prefent difracted tiate of the country. It was indeed obrious, that France at this time flood in nced of a dictatoblitip, or of a goverament poffeffed of more abfolute authority than can be enjoyed by one that acts, or even pretends to act, upon the moderate priaciples of freedom. It was therefore determined that the convention hould remain undiffolved till the cad of the war; and that a revolutionary government, to be conducted by its members, thould be eltablithed, with uncontrouled powers. Committees of its own body were felected for the purpofe of conducting crer: department of bunnets. The chief of thefe commit. tees was called the cummittee of public fofity. It fuperintended all the relt, and gave to the admanitration of France all the fecrecy and difpatch which have been ac. counted peculiar to a military government, together with a combination of aill and energy hitherto unknown among mankind. A correfpondence was kept up with all the Jacobin elubs throughout the kingdom. Commifioners from the convention were ient into all quarters, with unlimited authority over every order of perfons. Thus a government poffelled of intinite vigilance, and more abfolute and tyramical than that of any ingie delpot, was ettablinitied; and the whole tranfactions and refurces of the tlate were known to the rulers. On the 23d of Augult, Barrere, Fr 377 in name of the committee of public fatety, procured reed to be the celebrated deciee to be palled for placing the whole in a ftate ot. French mation in a fote of requi/dion for the public ${ }^{\text {r }}$ quation. fervice. "From this moment (liys the decree) till that when all enemies thall have been driven from the ternitory of the republic, all Frenchmen thall be in permanent readinefs for the lervicc of the army. The young men thall march to the combat; the married men thatl forge arms, and tranfoort the provitions; the women thall make tents and clothes, and attend in the holjitals; the children thall make lint of old linen; the old men ilall canfe themblves to be carried to the public: fquares, to excite the courage of the warriors, to preach batred againf the carmic of the republic ; the cellars tha:l] be wahed to procure filtpetre; the fodde-sorlen thall be given up to complete the cavaliy; the wamarried citizens, from th:e the of 18 to 25 , thall march firit, and none hatl fend a fubstitute; cerery battalion: ftatil have a banner, with thi, infeription, ITze French naizon rifen agam/t curan:s." 'The decree alforegulates the mode of organiang thin mud. A decrece more ty-

ranaical than this was never made by an eatern defoot; and when it was firil publibhed, foremers were at a lof, whether to regard it as a fublime effort of a powerful govemment, or as a wild project which ccuid produce nothing but confufion. The effects of it, howexer, have been truly terrible. We have already mentioned fome of them in the bloudy contelt which occurred upon the Rhine, and Earope was foon dentined to bear witnefs to ftill more extraordinary events.

In the end of July, General Cuttine was brou he to trial, and executed, in confequence of a variety of accufations of infidelity to his truit and difeefect to the convention. The queen was next brought to trial before the revolutionary tribunal, on the 15 th of OAtober. The charges againt her were very various; but the chief tendency of them was to prove that he had always been hortile to the revolution, and had excited all the efforts that had been made by the court againt it. On the 16 th of Oetober, this beautiful woman, whom fortune once placed fo high, ended her days on a fcaffold, after a mock trial, in which no regard was paid either to juftice or decency. She behaved with much dignity and compofure, and appeared deeply impreffed with a fenfe of religion. The members of the convention who had been at the head of the Girondift party, and had either been detained in prifon fince the 3 Ift of May, or feized in the departments to which they had retired, were afterwards brought to trial. On the 3 oth of October, 21 of them were executed, viz. Brillot, Verguiaud, Genfonné, Duprat, Lehardi, Ducos, Fonfrede, Boileau, Gardien, Duchatel, Sillery, Fauchet, Dufriche, Duperret, La Source, Carra, Beauvais, Mainville, Antiboul, Vigée, and Lacaze. Seven-ty-one were ftill detained in confinement. The duke of Orleans was afterwards condemned, on a charge of having afpired to the fovereiguty from the begirning of the revolution. His execution gave fatisfaction to all parties. His vote for the punilhment of death upon the trial of the late king had done him little honour even in the opinion of the Mountain, and had rendered him odious to all the rell of mankind.
The execution of perfons of all ranks, particularly of priefts and nobles, became now fo common, that it would be in vain to attempt to give any detail of them. Every perfon brought before the revolutionary tribunal was condemned as a matter of courfe. The Jacobins feemed infatiable in their thirft after blood, and the people at large appeared to regard their conduct with unaccountable indifference. When the human mind is once roufed, its activity catends to every object. At this time a new table of weights and meafures was eftablifhed by the convention, in which the decimal arithmetic alene is employ- ed. The court of Spain had the liberality, notwith. Itanding the war, to fuffer M. Mechain to proceed in his operations for meafuring a degree of the neridian in that country. He carried on his feries of triangles from Barcclona to Perpignan; and from this place the menfuration was continued to Paris. M. de Lambre, and his pupil M. le Francois, alfo meafured a degree of latitude in the vicinity of the metropolis. In all, 12 degree, of the meridian were meafured; of which the mean is 57027 toifes, and hy this the univerfal ftandard of meafure is calculated. M. M. de Borda and Caffini determined the length of a pendulum that fwings fe-
conds, in s'aut, and in a mean temperature at Paris, to Fiance. be 3 feet and $8, c 6$ lines. M. M. Lavoilier and Hauy
found that a cubic foot of ditilled water at the ireezing
1793 . point weighs in racu 70 pounds and 60 gros French weight. We thall infert a table of the meafures and weights now eftablithed.

Fanve. A piece of filver coin weighing a connsouse and a frav of Giver, acconding to the fomer ftandard, will be worth to fols ic: denier. The milhiare or thatfand merres, is fubkituted for the mile; and the an for the arpent in land-meature. The lutere two ate to each other as 49 to 25 . The at?ronomical citecks with which M. M. de Borda and Catim made the obGerations, ane divided according to this, plan. The quadrant coatuins 100 degrees, and each dirgree 100 minutes. Heace the minute of a great cirele on our sture is equal to a milliare, or new Freach mile. 1i, for the reduation of this mafure, we eltimate the Paris tolie, according to the com ari on made with the flambly hept in the Royal Suciety of L mdon, at 6.3925 Englih feet, the millhare or minute will be tqual to 1093.633 254 yards, and the metre 3.260599 fect.
A rew la- At the fame perios a new kalendar was formed.-
lendar
formed. By it the year is made t, begin with the autumnal equinox, and is divided into 12 months. Thefe are called Vindemiaire, Brumaire, Frimaire, Nirofe, Ventofe, Pluviofe, Geminal, Floreal, Prairial, Metididor, Thermidor, and Fructidor. The months contint of 30 days each, and are divided into three decades. The days of each decade are known by the names of Primidi, inodi, Tridi, \&ic. to Decall; and the day of telt is appointed for every tenth day, intead of the leventh. The cay (which begins at midnight) is diritibuted into ten parts, and thefe are deciaally divided and fublivided. Five fupernumerary days are added every ycar ffer the 3 th of Frustidor. To thefe is given the abfurd appellation of Sans Culotides, a word borrowed from a term of reproach ( ${ }^{\text {anns }}$ culutite), which had witen been bellowed on the republican party from the meannefs of their rank and fortunc; but which that farty now attempted to sender honourable and popalat. The childihat folly of this imovation has thres cuery pertion with furprife, as it can ferve no good purpofe whatever. It is a wonderful inflance of the wayTardnef, of the human mind, which can occopy itcelf one moment wish deeds of favage barbarity, and tie ;est wi:h a matter io uximportant as the artificial st: divimon of time.

The religion of France had been gradutly loing its Soluence: a'd on the jth of November, Gobet, billop of Paris, along with a great multituce of other eccledaflics, came into the hath of the convertion, and inlem:iiy religned their functions and renounced the Chritian ifligion. All the clergymen, whether Proteliant or Catholic, that were members of the ronvention, followed this example, excepting only Gregoire, whom we furraetly mentioned an laving been one of the firl priefts that joincd the Ti, J:Ce: after the metsing of the States General. He had the coaraze to profeds himklf a Chriflian, ah: fough he faid that the emolumeuts of his bilhopric were at the fervice of the repubiic. With the arciarations of the convention, it was decreed that the ouiy Fench deitics hereafter hould be Liberty, Equality, Rcalin, Eic. and they would feem to have coufiosated thefe as a hind of new object of worlitip. What political purpole the leaders in the cunsention in. - ended to ferse by this proceeding docs not clear'y appear; unlet, propap, their object was to rencer tlee Frets manners and modes of thinking fo cumpletely new, then it thould ne:er be in their poner to retum to $\because$ : iste from which they had jut emerged, or :o unite
in interenurfe with the obhermention of Carope. The Finere

 1rariy ofded the chur hes th the the but the con-
 Robetpieare gained tu fimall derree of posiaty in fupporting the ibiberty of 1 ioun wormip on this occulion. Hebort and Yabre d'E lantine, who led the opponte party, haflencd their own fall by this ill judsed conteapt of popular opinion.

Fur, now that the republic faw itell fuccelfol in 2 ant is all quater, when the Mountain party and the lacobins the monhad no tival at home, and accounted themfelves in no anin and immediate danger from abroad, they legan to fiplit into It evon fattiuns, and the fircest jealowhes arote. The lacotin club was the wiual phice in which their contelis were carried on ; and at this time Robetpierre acted the fort of a mediato: betwest all partici. He attempted with great art to turn their attertion from private anmoditio to public affars. He fipread a teport that an invali:a of Great Britain was feedily to take place. He therefure propoled that the facobin club thould let themilves to work to diforer the valuerable part; of the Britith conttitution and govermment. They did fo: They made feceches, and wrote efiays without number. And in thi way was the moft feice and turiulent band of men that ever perhaps exifited in any country occupich and amufed for a very conliderable time. What is mo lefs fingular, a great number of Britihh fubjects farouted the plans of thele reforning Atheilts, and, under the frecious appellation of the Fricnds of the Poy, acted in concert with the French Jacobins.

The winter pafled away in tolerable quietnefs, and no 4 prow. military enterprife was undertaken either by the allices or by ihe French. On the ift of February, Barrere thent afierted in the Convention that the confederate powers :i.e repmis were willing prowifionaliy to acknowledge the French ic by the republic, to confent to a ceffation of hoftilities for twa alliew re. years, at the end of which a lating peace thould be erine conven ratified by the Freach peopic. But this propolal the tion. convention declared itfelt determincd to reject, is affording to the other mations of Europe the means of $3^{\text {ss }}$ undermining their new government. In the mean time, Vigor us the revolationary government was gradually becoming rewoultionmore vigorous. Thirty committec of the convention rey fovern. managed the whole bufinefo of the itate, without haring ment. mach of the direct eaccutive govermment, which refled in the committec of publice fafety. Theie different committees were engaged in the utmolt variety of otjects. The ruling party had no competitors for power. Withont confation oe appolition, therefore, the mofl extenfise plans were rapidly carried intu eflicer. The convention was litule more tian a court in which clery project was foleminly regitered. In the fime fe:fium 30 decrees would fometimes be pafled upon oljects the molt widely diferent. The finences were minder Yanab one committe, at the head of which was Cambon. - ment wi This cummittce found refourcen for the moll lavihe ex- cre and penditure. The alfignats were received is moterey antert. throughuse the flate; and thes a pat. r mill was taid to wrmo have become more valuable than a mine of gid. Ticiz the :atom credit wos fupported by an arbitrary haw regulating the mav.mum or highett price of all povilions, and by the immenfe mafs of wealth which had come into the hand of t!e convention by feizing the church lande, and l:

Erance. confilcating the property of royalink, emigrants, and perfons condemned by the revolutionary tribunal. So unequally had property been divided under the ancient government, that by means of thefe confifcations about feven-tenths of the national territory was luppofed to be in the hands of the public. To this was added the plunder of the churches, confifting of gold and ilver faints, and utenfils employed in divine worhip, along with other articles of lefs value; among which may be mentioned the innumerable church bells, which were regarded as fufficient for the manufacture of 15,000 pieces of cannon. Thefe refources formed a mafs of property fuch as never was poffeffed by any government.

Other committees were engaged in very different objects. Highways were conftructed, and canals planned and cut throughout the country. Immenfe manuffictories of arms were everywhere eftablithed. At Paris alone 1100 mukets were daily fabricated, and 100 pieces of cannon caft every month. Public fchools were afliduoully inflituted, and the French language taught in its purity from the Pyrenees to the Rhine. The French convention poffeffed immenfe refources, and they did not hefitate to lavilh them upon their fchemes. Every fience and cvery art was called upon for aid, and the moft accomplifhed men in every profeffion were employed in giving Splendour to their coun try. The chemifts, in particular, gave effential aid by the facility with which they fupplied materials for the manufacture of gun-powder; and in return for their Services, Lavoifier, the greatelt of them, fuffered death by a moit iniquitous fentence, Not fewer than 200 new dramatic performances were produced $i_{1}$ lefs than two year, ; the object of which was to attach the people to the prefent order of thin_s. The vigour with which the committees of fubfiltence exerted themfthes is particularly to be remarhed. As all Europe was at war with France, and as England, Holland, and Spain, the three maritime power, were engaged in the content, it had been thought not impoffible to reduce France to great diltrefs by famine, efpecially as it was imagined that the country had not refources to fupply its immenfe population. But the prefent leaders of that country acted with the policy of a beheged garrifon. They feized upon the whole provifions in the country, and carried them to public grararies. They regitered the cattle, and made their owners refponible for them.They provided the armies abundantly, and, as the people were accurately numbered, they dealt out in every diftrict, on ftated occafions, what was abfolutely neceflary for fubfiffence, and no more. To all this the people fubmitted; and, indeed, throughout the whole of the nised feenes of this revolution, the calm judgment of the liftorian is not a little perplexed. We cannot avoid admiring the patience with which the people at large endured every hardhip that was reprefented as necentary to the common caule, and the enthufiaitic energy with which they lasiffed their blood in defence of the independence of their country. At the fame time, we winf regard with indignation and difgutt the worthlels intrigues by means of which the fanguinary factions in the convention and the capital altenntely maffacred each other.
Diffenfices
bert, Ronfin, Vincent, and others ; but the old focicty retained its afcendency, and Robefpierre was now decidedly its leader. This extraordinary man had gradu-

Fiarce.
1794. ally accumulated in his own perfon the confidence of the people and the direction of the government. As the committecs were above the Convention, which was become little more than a filent court of record, fo the committee of public fafety was above the other conmittees. Robefpierre was the leader of this ruling committee. Barrere, St luit, Couthon, and others of its members, only acted a fecondary pait. They laboured in the bufincls of the itate, but the radical power was with Robefierre. He furrounded the members of the Convention with fuies. He was jealous and implacable, and let no bounds to the thedding of blood. On the $25^{\text {th }}$ of March he brought to trial the following active lacobins, who were condemned and cxecutcd on the following day : Hebert, Ronfin, Momoro, Vincent, Du Croquet, Koch, Col. Laumur, M. M. Bourgeois, Mazuel, La Boureau, Ancard, Le Clerc, Proly, Detfieun, Anacharfis Cloots, Pereira, Florent, Armand, Defcombles, and Dubuifion. Not fatisfied with this, on the 2 d of April he brought to trial nine of thofe who had once been his moft vigorous affociates, Danton, Fabre d Eglantine, Bazire, Chabot, Philippeaus, Camille Defmoulins, Lacroix, Delaunay d'Angers, Herault de Sechelles, who, along with Wefterman, were executed on the evering of the 5 th.

Still, however, the preparations for the enfuing Preparacampaign were proceeding with unabated vigour. The tion for commitice for military aftairs, at the head of which pargn of were Carnot, La Fitte, d'Aniffi, and others, was bufy ${ }_{40,4}$, and in arranging along the frontiers the immenfe force which plan of the the requifition had called forth. Plans of attack and ahtes. defence were made out by t is committee ; and when approved by the committee of public fafety they were fent to the generals to be executed. On the other fide, the allits were making ponerful preparations fer another attempt to fubjugate France. The emperor himfelf took the field at the head of the armies in the Netherlands. The plan of the campaign is laid to have been formed by the Autian colonel Mack. Went Flanders was to be protected by a itrong body of men; the main amy was to penctrate to Landrecies, and getting within the line of French frontier towis, it was to cut them off from the interior by covering the country from Maubeuge to the fea. The plan wa bold. It belongs to military men to judge whether thi was not its only merit. When attempting to put it in exccution, the allies mull have been ill informed of the immente force which the French were collecting againl them. Even the tuwn of Linle alcne, which is capable of containing a nmmerou army within its walls, and which was to be left in their rear, thould have licmed an infurmountaile objection to the plan.

On the 16 th of $A_{\text {pril }}$ the Aufrian, Brit:Ah, andState of ${ }^{392}$ Dutch armies affembled on the heights above Cateau, he whet and were revicwed by the emperor. O , the following ${ }^{\text {nturs. }}$ day they advaned in cinh eolumns ifs indt t e F:ench, drove in their whole poils, and penetrated veyond Landrecies; which place the French attemptec to rehese, but without fuccefs. The allied army new amounted to 187,000 men, who were difinsed in the following menner; 15,000 Dutch and 15,000 stuf: 's, turie: the prince of Orange and Gemeral Latour, bornee lie

France.
fiege of Lahdrecies; $1_{5}$,000 Britifh, and $15,2 c=$ Autrians, commanded by the duke of York and General Otto, encamped towards Cambray. The emperor and the pince of Save-Cobourg, at the head of 60,000 Auftrians, were advanced as far as Guife; 12,000 Hethians and Audrians under General Worms were ilationed near Duay and Bouchain; Count Kaunitz with $1_{5,000}$ Auftians defended the Sambre and the quarter near Mubbenge ; and, laftly, General Clairfait, with 40,002 Auflians and Hanoverians, protected Flanders from Tournay to the fea; 60.000 Prulians, for whom a fubfidy had been paid by Great Britain, were expected in addition to thefe, but they never arsived.

The French now commenced their active operations. On the morning of the 26 th of April they attacked the duke of York near Catean in great force. After a fevere conflict they were repulfed, and their general Chapuy was taken prifoner. At the fame time they attacked the troops under his Imperial majefty, but were there allo repulfed in a fimilar manner ; lofing in all 57 pieces of cannon. On the fame day, however, General Pichegru advanced from Lilie, attacked and defeated General Clairfait, took 32 pieces of eannon; and, in the courfe of a few days, made himfelf matter of Vervic, Menin, and Courtray. On the 29th of April, the garrifon of Landrecies furrendered to the allies. When this event was known in the convention, it excited a confderable degree of alarm. It was, however, the laft effectual piece of fuccefs enjoyed by the allies during this difaftrous campaign. General Clairfait was again completely defeated by Pichegru in a general engagement; and it was found neceffary to fend the duke of York to his affatance. This movement was no doubt unavoidable; but the effect of it was, that it fplit down the allied army into a variety of portions, capable of carrying on a defultory warfare, but unfit for the vigorous objects of conqueft. On the roth of May the duke of York was attacked near Tournay by a body of the enemv, whon he repulfed; but he was unable to join Clairfait, upon whofe deftruetion the French were chiefly bent: for at the fame time that the duke of York was occuricd by the attack upon himfelf, Pichegru fell uron Claiffit with fuch irrefiftible impetuofity, that he was compelled to retreat in confufion, and a part of lis army anpears to have fled to the neighbouriood of Eruges. While Pichegru was thus advancing fuccefsfully in We? Flanders, General Jourdan advanced in East Flanders from Mauleuge, crofied the Sambre, and fo:ced feomeral Kaunitz to retreat. On the 18 th, hovever, General Kaunitz facceeded in repulfing the enemy in his tarn, and they re-crofled the Sambre with confideratile lote.

The allies now found that no progreis could be ma?e in France while General Pictegru was advancing furcels fully and occupying Weat Ftanders in their rear. The emperor, therefore, withdrew the greater part of his army to the neighbourhood of Toumay, and reflued t) make a grand effort to cut off the commanisation between Courtray and Life, thus to pevent com leteIo the retreat of Pichegru. On the nimpt of the 160 h, the ormy moved foreards in five colamm for this purIf COn it was at the fame tine dincotet to crof +i:I. . is eT. it a ceneral junction, if pollithe, md C. ${ }^{\prime}$ :a. The attem turisg that evenine:

day, the uivifion under the duke of Yorl. was overpoisered by numbers and defeated. The progreti of the rell of the columers was flopped, and Claifat completely defented. In the confufion of the day, when attenpting to ristly the difterent part, of the divifion which he commanded, the duthe of York was feparated from his owa troops ly a party of the eremy's cavalry, and only cfarad being made pritoner ty tle fivitnets of his horfe. The plan of the allies heing thus frultrated, their army withdest to the nei. hewor hood of Tournay.

Pichegru fpeedily attempted to retaliate againit the alliec. On the 22d of May he brought down at daybreak his whole force againtl them. The attack was commenced by a heasy fire of artillery, and all the advanced poits were forced. The engagement fonn became general; the attack; were repeatedly renerned on both fides; the whole day was frent in a fucceffion of obftinate battles. Ail that military lkill could do was performed on both fides. The French and the allied foldiers fought with equil courage and equal difcipline. At nine o'elock in the evening the French at laft reluctantly withdrew from tle attach. The day on which a vanquithed enemy ties from the field is not always that on which the victory is won. In this engagement the French were unfucceffol in their immediate object ; but the weight of their firc, their fteady difcipline, and their violent obitinacy of attack, raifed their military character high in the ellimation of the otheers and foldiers of the allied amm It was foon perceived, that in addition to thefe the y poffefled other advantages. Their numbers were immenfe; they implicitly obeyed their generals; who, being men newly raifed from the rank of fubaltern, as implicitly fubmitted to the directions of the committee of public fafety. A combination of efturts was thus produced whofe operation was not retarded by divided comfls. On the other fide, the numbers of the allies were daily declining; their leaders were independent princes or powerfin men, whofe fentiments and interefts were often very holite to each other, and their extrtions were confeguently difinited.

On the 2 th the French again crovied the Sambre, but were driven bark with much lofs. On the $27^{t_{1}}$ an attempt was made to beliege Charkeroi, 1 it the prince of Orange on the 3 d of June compelled the in to raife the fiegr. On the 1 ath a fimilar attenst was made, and they were again repulied. In Well Flan- H . dir, however, Pichegra was lufficiently ftong to rom- wo to mence the fieste of Ypres. He was foon attacked by Yiter, ad General Clairfait for the porpobe of relieving it, but without furcefs. - Ypres was garrifoned by $\quad 200$ men ; seinforcement were therefore daily it at from the grand army to Clarfait for the purpofe of relieving it. It is unneceffary to mertion the bloody contents in which that unfortunate fermal wos daity engaged with the French. It is fill cient to fay. that they were uniformaly undacectal, and we:e the means of wathe, oef in a pret duyce, the armies of the allics. Ypres held takesis. out till the rath of Tune, when it capitulatel: and fuch was the diftipline of the low in atasy at this time, that no notiee could Le whaised, for leveral dase of that co..t. B, in conequen $c$ of this and of other events, the duhe ef Yoinh tums it necefliory to retreat ti: Oede. 2mide: Sir Juadi, ffer ftorning the Auttriun cump

Pranes.
3794. häleni furtendered, and the Auftriars defarate. Quefnoi, were fruitlefsly left with garrifons in them. The allied troops, evacuating Namur, formed a line from Antwerp to Liege to protect the country behind. The French advanced in full force, and attacked General Clairfait, cut to pieces half the troops that now remined under him, and broke the line. The allies retreated before them. The duke of York was joined by fome troops under the earl of Moira that with much dificulty had made their way to him from Otzend; and with thefe and the Dutch troops he retired to the neighbourlhod of Bergen-op-zoom and Breda for the protection of Holland. The prince of Cobourg evacuated Liege, crofied the Maefe, and placed a garrifon in Maeitricht. He foon, however, fent back a part of his troops to the neighbourhood of Tongres; for here, to the athonilhment of all Europe, the French ammics made a voluntary paufe in their career of victory, and ceafed to purfue their retiring foes. Sluys in Dutch Flanders was the only foreign polt that they continued to attack, and it furrendered after a fiege of 21 days.

## And on the

 Rhine.of Butignies, now adsenced with fuch frength upo: Charleroi in the eaft that its immediate fall was feared. As this would have enabled the two French armies to encircle the whole of Flanders, the prince of Cobourg advanced to its relief. Charleroi furrendered at difcretion on the $25^{\text {th }}$. This circumftance was not known by the prince of Cebourg when he advanced on the $26: h$ to attack in their entrenchments the army that covered the fiege near Fleurus: but the covering army heing by this time reinforced by the acceffion of the befetging army, the allies were repulfed. Jourdan then drew his men cut of their entrenchments; and, in his turn, attacked the Auftrians. He was three time; repulfed, but was at laft fuccefsful: the lofs of the vanquihed army is faid to have been prodigious; but no regular accounts of it have been publiked. The French unqueltionably exaggerated their own fuccefs, when they faid that it amounted to 15,500 men.

The allies now retreated in all quarters. Nieuport, Oftend, ard Bruges, were taken ; and Tournay, Mons,
menfe quantitics of grain and other ftores. Thefe were embarked on board 160 fail of merchantmen, convoyed by hix fail of the line. Lord Howe falled to intercept this valuable ronvoy. The French fleet failed at the fame time to protect it. On the morning of the 23 th of May the tleets came in fight of each other. 'I betctory ef Britith admiral had previoully defpatched fix lhups of fleet unthe line under Admiral Montague to intercept the der Lord French convoy, while he thould engage and detain the Howe. grand fleet. The French dilpatched eight fail to defeat this attempt. In the courie of the 2gth Lord Howe got to windward of the French fleet. His force was 25 , and theirs was 26 , fail of the line. The following day he bore down upon them, and broke their line. The engagement was one of the fevereft ever fought. The French admiral, in lefs than an hour after the clofe action commenced in the centre, crowded off with 12 of his lhips. The Britih fleet was fo much difabled, or feparated, that feveral of the French difmantled flips got away under fails raifed on the ttump of their fore-matls. Seven fail of the line, however, remanied in poffeffion of the Britifh, and two were unqueftionably funk. In the mean time, Admiral Montague fell in with the French convoy, but it was now guarded by 14 fail of the line. As he could not encounter fuch a force, he returned home, and it was fafcly conveyed into port. 'Thus, by one of thofe contradictions which fo often occur in human affairs, the Britilh fleet was victorious, and the French were left in forme meafure mallers of the fea. As this engagement however teflified that the Britifh feamen had not loft their ancient fuperiority on their own element, the nation regarded the prefent victory as a pledge of it, independence, and very general rejoicings took place in confequence of it.

In the mean time, the revolutionary fyftem of go-The horrid vernment in the hands of committees of the convention executions at Paris, and of committees of the popular focieties in Paris throughout the country, was arrived at its higheil per- ${ }^{\text {continued. }}$ fection, and proceeded without oppofition in its fevere and fanguinary meafures.

On the 1oth of May Madame Elizabeth, fifter of the late king, was facrificed by it in confequence of a decree of the revolutionary tribunal. Multitudes of others of every rank and fex were daily facrificed in a fimilar manner ; the rich in particular were the great objects of perfecution, becaufe the confifcation of their property added to the ftrength of the ruling powers. But Immenie 403 neither were the poor lafe from the bloody vigilance of pover of this new and fingular government. By the different Robeexecutions Robefpieare had contrived to deilroy every ${ }^{1 \text { pierre. }}$ avowed rival. All the contlituted authorities confifted wholly of perfons nominated with his approbation; and as the committees which conducted the bufnefs of the fate were at his difpofal, his will was irrefiftible throughout the republic. He met with no oppofition in the convention; for that body was no longer the turbulent popular affembly which it had once appeared; it was little more than a name employed to give fome fort of refpectability to fuch fehemes as were propofed to it.

Amidft this accumulation, however, of fecmingly ir- Verging to refiftible authority, Robefpierre was at the brink of rain. ruin. The whole of the old Girondit party was indeed fubdued and filent ; but many members of the convention ftill semaned attached to $\mathrm{i}_{\mathrm{i}}$. The party of the Mountain:

## F R A $\left[\begin{array}{lll}155\end{array}\right] \quad$ F R A

France. Mountain, by mieans of whom Robefpierie had rifen to power, with little fatistaction now found themtelves not only difregarded, but ready at every inftant to fall a facrifice to that fyttem of terror which they lad contributed to erect. Even the Jacobins themblelves, though neither timid nor cautions in the heddiner of blood, began to murmur when they faw that :ovial privilege contined excluavely within a few hand, wr rather monopolized by an individual. In thic kate things remained for fome time ; and it appeared how poffible it is for an individual to govern a great nation even while the whole of that nation is hoftile to his power. The banilmment or imprifonment of all foreigners, which had long been sigoroutly practifed, prevents us from poffeling much accurate information concerning the internal thate of France at this period; but it is certain, that one circumblance in particular tended much to accelerate the fall of Robefpierre. He had procured a decree to be paffed, authorifing the committee of public fafety to imprifon at its pleature, and bring to trial, any menber of the convention. All the individuals of that body found themfelves placed by this decree in the hands of a man whofe fevere and fufpicious temper they well knew. Still, however, they were fo much furrounded by filies, that it was difficult to form a party or plan of operations; even the majority of the committee of public fafety were among the number of the difcontented, but they
by the cunvation on account of their refitance. Thes were tout the atore tried, unkef tor the purnofe of identifying their perhons; atn, in the courle of that dyy,
 alto exceuted for joitang an their achation ; and in thi way a lorm parim owa, whity at ohe time thre tene 1
 rope with aftomifnent. Thes aho temental! the ea reer of the muit extadomathary man thet the !rench re volution had Irombt forward. H1- taients were undoubtedly contiderable, and his amlition bieve no bounds, bidding defance to the ordmary feelings ui in manity. Had Dumouricr poliefled his coohetramecaution, or had he pollelied the military thente of Numenrier, the convention would certanly have been overturned, and we thould have feen a lecond Cromnell on the throne of his murdered fovereign.

After the fill of Robefpierre, the convention exhi- ry edem lited no fmall change of appearance. Intead of that : terior filence which tomerly prevailed, all was buile and swe phace noife; all acculed each other. There was no longer tonteraany leader, and there was no tormed party. The former tin... fyftem of terror was declared te be at an end, and a new fyfiem of moderatifm fucceeded. This was carried to as great a height as the fyltem of terror had formerly been; and all means were taken to sender popular the fall of their late tyrant. The committees were or ganifed anew, and their members ordered to be frequently changed. The correfpondence between the affiliated Jacobin clubs was prohibited, and at latt the Jacobin club itfelf was abolimed. This lat event was accompliked with eafe; and that fociety which had been the great engine of the revolution, was itfelf without refifance overturncd. Seventy-one deputies of the Girondit party, who had been impritoned fince the 3 it of May 1793 , were let at liberty. 'The name of Lyons was rellored to it. Some of the agents of Rolsepperre were punifhed, particularly the infamous Carrier, whofcruelties in La Vendée we formerly mentioned. Still, however, the convention appeared io little united and fo little decided with regard to objects of the fard importance, that in all एrobability they would not have conducted the important 1takgle agginit the amtions of Europe with more fuccefs than the Girondit party had formerly done, if the revolutionary government and the late fitem of terror had not already accumulated in the: hands fuch vall rcfources, and traced out fuch a plan of procedure, as revdered it an cafy matter to preferse their numerous armies in the tain of in cels to which they were now habituated.

The allice in their retreat had left ttrong garrifons the lrene in the French towns which had furrendered to them. tnun. Thefe were Conde, Valercionnes, Suethoi, and Lant garsione drecies. They now furrendered to the republican ar-hy he he at mies with fo little refinance, that the conduct of the em-lies furrer. peror began to be contidered as ambinuas, and he waster w:thfufpected of having entered into fome hind of com- out etils promise with the lirench. This idea proved crronecus; and a- fom as the army which had belieged thele towns was able to juin the grand army mander Piehegra and Jourdan, the operations of the campaign sere refume. afier a fatipention of almoit two months. The French army divided itfelt into two hodies. (ne of thele under Jourdan adwated arsinft Coneral Caisfait, whon had fucceeded the prince of Cobours in the comman!

## F R A $\quad 156] \quad \mathrm{F} \quad \mathrm{P}$ A

France in the ne abourhood of Muefricht. On the $15^{\text {th }}$ of September the French attacked the whole Autrian poits in an extent of five leagues from Liege to Nae4s forich. Oa that and the following day the ioffes were fuccefen of nearly equal. On the 17 th the French with 50 picees the fiench of cannon attacked General Kray in his entrenched camp before Maeltricht. M. de Kray was already retiring when General Cluiffait arrived with a ftong reinforcement, and after a fevere combat the French were once more complled to retire. Un the 18th the French renesed the attack with tenfold fury upon every part of the Aulriaze line, and the whole was compelled to fly to the neighoustond of Aix-la-Chapelle. General Clairfait now chufe a iltrong poftion on the lanks of the Roer, where he even declared it to be his wilh that he might be attacked. But by this time the farit of his army was humbled, defertions became numeros, and the want of difcipline was ex:reme. (nn the it of OEtober the French crolled the Hatefe and the Roer, and attacked the whole Auftrian poits from Ruremond down to Juliers. After a bloody engagement, the brave and active, though unfortunate, General Clairfait was compelled hatily to crofs the Rhine, with the lofs of 10 or 12,000 men. The French general did not attempt to crofs that river, but one detachment of his army took pofieliion of Coblentz, while others laid clofe fiege to Venlo and Maefricht, winich

The French, on the contrary, well received, abounding in every thing, and proud of inghting in a popular caule, now acted with much order, and fubmitted to the itrictelt 1794. dilcipline. In addition to all thefe advantages, the French leaders had the dexterity to perfuade the world that Conduct, new and unknown arts were employed to give aid to and itate, their caufe. At this period the tulegraphe was firit of the ufed for convesing intelligence from the frontiers to French the capital, and from the capital to the frontiers. (See ${ }^{\text {armies. }}$
Telegraph). Balloons were alfo ufed by the French during this campaign to procure knowledge of the pofition of the enemy. An engineer afcended with the balloon, which was fuffered to rife to a great height, but prevented from flying away by a long cord. He made plans of the enemies encampment; and during an attack he fent down notice of every hoftile movement. In the aftairs of men, and more efpecially in military traulactions, opinion is of more importance than reality. The French foldiers confided in their own officers as men poffefled of a kind of omnifeience, while the allied troops, no doubt, beheld with anxiety a new contrivance employed againit them, whofe importance would be readily magnified by credulity and ignorance. With all thele advantages, however, after the capture of Nimeguen, they once nore made a halt in their career, and abitained from the attack of Holland, which now feemed almoit proltrate before them.

While thefe events occurred in the north, the French Their fucarms were fcarcely lefs fucceffful on the fide of Spain. cefles in Bellegarde was taken; in the IVeftern Pyreneec, Fon.Spain. tarabia furrendered, and alfo St Sebatian ; the whole kingdom of Spain feemed panic ftruck. That feeble government, with an almoft impregnable frontier, and the moft powerful fortreffes, could make little refiltance; and the difficult nature of their country was their only protection. The hiftory of this war is only a hiftory of victories on the part of the French. In the Eaftern Pyrenees, on the 1 -th of November, the French general Dugommier was killed in an engagement, in which his army was fuccefsful. On the 20th of that month the French again attacked the Spaniards, and routed them by means of the bayonet, without firing a fingle mufket-fhot. Tents, baggage, and cannon, for an army of 50,000 men, fell into the hand of the conquerors, along with a great part of the province of Navarre. Towards the end of the year, an army of 40,000 Spaniards, entrenched behind 80 redoubts, the labour of lin months, fuffered themfelves to be completely routed; their general Count de la Union was found dead ca the neld of battle, and the whole Spanifl artillery was taken. In three days thereafter, the fort Fernando de Figuieres, containing a garrifon of $9 t<7$ men, furrendered, although it mounted $\mathbf{5} 7 \mathbf{1}$ pieces of camon, and pofielied abundance of provifions. The French continued their conquetts; Rofas was taken, and the whole province of Catalonia was left at the nercy of the inwaders.

The fuccentes of this wonderful campaign were not The con. ${ }^{4}$ ra yet terminated; and the latt part of them is pethaps the quet of moil important, although no great effort was uecefiiry Holay d to its execution. The winter now fet in with unennt-meted. mon feverity. For fome years pat the featons of kurape had been uncommonly mild; there hat been little fronl in winter, and no intenfe heat in fummer. But doring the late foafon the weather how long been re-
mink tuly

markably dey till the latter fart of harven, when there fell a comiderable, though by no nicats t:nuturl, ramtity of rain. 'Towards the end of December a fovere frot bound up the whole of the rivers and laties of Hulland. The Waal uas frozen over in the be inning of Jduary; a circumitance which had not occured fur 14 years pait. Taking advantuge of̂ this, the Freach crolled that river, and with little oppolition feized the important pefs of Bummell, which at other feafons is fo ftrong by its inundations. The allied army had been joined by 17,000 Aceltrians, and had received orders to defend Holland to the latt. They did to, and were fuccefsfu! in repuling the French for fome days between the Waal and the Leck; but the republican army, amousting to $70,000 \mathrm{men}$, having at Ialt advanced in full force, the allied troops were compelled to retire acrofs the Yfiel into Weitphalia. In the courle of their march through this defert country, in the midn of fevere frolt and a deep frow, they are faid to have fuffered incredible hardilips, and to bave lolt a very great number of men. The French, in the mean time, advanced rapidly acrofs the country to the Zuyder fea, to prevent the inhabitants from tlying, and carrying off their property. $O_{n}$ the 16 th of January 1795 , a party of horfe, without sefilance, took poffetion of Amilerdam. The other towns furrendered at difcretion. In conieguence of an order from the itates general, the frong fortrefies of Bergen-op-zoom, Williamitadt, Breda, \&c. opened their gates to the French. The tleet and the thipping were fixed by the intenfe froft in theirftations, and fell a prey to the enemy ; who thus, with little effort, made a complete conqueft of this populous and once powerful country. The French were well received by the people at large. The power of the itadtholder had been fupported among them merely by the intluence of Pruffia and England. Through hatred to this oltice, which had now become odious chiefly to the mercantile aritccracy of Holland, they were little attached to their allies, and gave them, during the prefent war, as little fupport as poffible. The fadtholder and lis family new thed to England. The French declared, that they did not mean to make fubjects but allies of the Dutch, and invited them to call together popular affemblies for lettling their own government, under the protection of the French republic.

Thus terminated a compaign, the moft aftoniling, perhaps, that hasbeen known in the hiftory of mankind. In the courfe of it, even before the conquelt of HolIand, the French had taken 2050 pieces of cannon and 60,000 prifoners. After that event, the conquered tersitorics added to them a population of nearly 14 millions of people. Luxembourg and Mentz were the only places on this fide of the Rhine that refifted them. The former was clofely blockaded, for the purpofe of compeiling it to furrender; the latter was feveral times affanled, bat fuccefsfully held out.

At this period Europe feemed to te weary of fuch a bloody contel, and the Diet of Ratifion intimated its refolution to arlopt fuch meafures as might tend to bring about a general pacification. A treaty was concluded between the grand duke of Tufeany and France. The convention declared their readinels to treat for peace with any of the powers of Europe apon honourable terms. Great Britain and Auftria, however, feemed: :o te perfanded, that an honourable aud fermanent

 isatance, fuch was the enmity of the Nocust in paty againtt the Ginesde, that atay treaty entered into Ly the latt: r would have been trampled unon loy the fot mer, and fuch, it was oblived, night contivip to be the afpeet of afiurs in that ditracte $i$ comery fir an iadefmite length of time.

As the conilitution which had been framm! in +1, In iell year 1793, during the tyrannica! dominic: © Fu'c!- 2t.tu". : lierre wats jutly deemed imprationble, a cumonitece was appointed to frame one entirely new. It $\mathrm{H}_{4} \mathrm{con}$ pofed of Sieyes, Cambaceres, Nerlin of Dutis, 1 in. baudeau, Mathieu, Le Sage of Eure and Loir, and Latouche. On the report of Cambaceres, the 19 , $h$ of April, that the committee thought that a commifion thould be appointed for this important bufinef, a :samber of qualified perfons were accordingly cholen, while all citizens were invited to communicate their fentimentio upon the fubject, and the committee was to give orders for the bett plan to be publified. The feclings of the nation at large received additional gratincation from the conduct of the convention towards Fouquier Tain. ville the prefident, and 15 judges and jurors, of the revolutionary tribunal. I'hey were fully convicted in the 8 th of May, and executed on the gth, hunched into etemity anidft the juft execrations of a valt multitude of fpectatots.

Although the Jacobins were defeated on the oft and it 2d of April, they did not confider themfleles as en............. tirely fubdued. They were plutting a mure extenfive infurrection, which was not to be confined to the canstal, and fixed on the zoth of May as the periut of revolt. On the morning of that day, the tocilin was accordingly founded, and drums beat to arms in the fuburb of St Antoine, in which the Jarobins had al ways enjoyed the greateft influence. Upon this ti.e convention met; and although the infurrection was fa: from being a fecret, the committee of public fatety did not appear to have taken any mealures to prevent it It was only at the moment when the infurgents were approaching that General Hoche was appointed to the command of the armed force, and lent to collect the military and citizens for the protection of the conver. tim. The hall was pretently furrounded, the ghard, were overpowered, and the mob forced their way into the midit of the afiembly. The multitudes of won.en who met upon this occation thouted for bread, and the conftitution of 1793. Vernier the prefident, a man is advanced in years, quitted the chair to Buifly d'Angla, who kept it with commendable fortitude during the remainder of the day. The mob had cockad, with this infcription upon them, " Bread, and the contlitution of 1793." One of the party attached to the convention. imprudently tore off the hat of one of the infirgenti, whom the multitule attacked sith fwords; and is le fled towards the chair of the prefideat, he was killed by by a mulket flot. The maiority of the members ges. dually retired fon thas fectic of lamleis intrufion, and left the multitude mafters of the hall. Fior of thec nembers who remained elpouled the caule of the infurgents, whofe triumph, however, was of very thon: consinuance. A large body of the military and the peaceable citizens vanquithed them in the crening, the powers of the majority were rettered, and the fomr 1 e-

puties who efpoufed the caufe of the mob were arrefled.

It would appear that the convention and the citizens of Paris now bolieved their tricmplis to be complete, as no meafures were adopted by them futicient to prevent the repetition of a fimilar outrage. The Jacobiac, how ser, were not yet cotermined to view their caute is detperate, for nest day they collecied in the fuburbs, and in the afternoon made a fecond atiempt. The Caroufal was taken by them without oppofition, when they pointed fome fieces of cannon againit the hall of the convention, the members of which being wholly unprotceted, endeavoured to gain over the mob by flat-tery.-by proming them bread, and the contlitution of 1793, or whatever elfe they thought proper to demand; and the prefident even gave the deputation the fraterral embrace. On the 23 d the citizens aflembled, and went to the Thuilleries to defend the convention from infult and violence. The military collected in condiderable force; and the convention was at length encourazed to act on the offenfive. It was decreed that if the fuburb of St Antoine did no: immediately furrender its arms and cannon, with the murderer of Ferrand, it would be declared in a ftate of rebellion. The generals of the convention received orders to reduce it by force; and the infurgents finding themfelves unequal to the conflict, were forced by the inlrabit nts to make an unconditional furrender, to preferve their property from the depredations of the military. The foldiers found among the prifoners were put to death, on which occafion fix of the members were tried and condemned by a military commiftion. Three of them were guilty of fuicide, and the other three were publicly executed.

In the fouthern parts of France, the Jacobins were equally turbulent as their brethren in Paris, and formed an infurrection at Toulon on the 20th of May, feizing on the gates, upon which they planted cannon; they fet at liberty fuch of their affociates as had been incarcerated, and detained the fleet which was about to put to fea. From Toulon they proceeded to Marfeill:s, at which time they were 3000 ftrong, and had 12 pieces of cannon. On their march they were oppofed by Generals Charton and Pactod, by whom they were defeated, s.00 of them being fent prifoners to Marfeilles, and Toulon was liberated.

The Mountain party, who were anxious to revive the terrific reign and meafures of Robefpierre, were now very much reduced, and expofed in many places to violent perfecution. Affociations were formed for the purpofe of avenging the crimes they committed during the continuance of their power. When we reflect on the character of Robefpierre's government and what all ranks of men fuffered under it, we mult confider it truly aftonihing that any number of men fhould hazard their lives in attempting its reltoration. The party was of courfe gradually abandoned by its adherents on the fall of its tyrant, and it funk in the eftimation of every one who examined it with atiention. Still, how"wer a finall party remained, the members of which were men of fuperior activity and enterprife. They confifted of ferocious republicans who thought they beheld the revival of royalty and ailtocracy in every attempt to eftablih a mild, foher, and regular government. Ye:, amidit the miverfal odium caft upon them, the Jacobins expected to rife once more into poner;
but what is mof ingular, the revival of their itrength is to be dated frem their unfucceffful infurrection juft now mentioned. Their want of popularity began to affect the convention, as the people remembered how tamely that body fubmitted to the tyranny of Robefpterre, of whofe power the maiority of the members had been the fervile intrument. 'l he prefs therefore, being now free, the moit hideous pichure of their conduct was held up to the public. The greater part of them now began to repent of their victory over the Jacobins, as they forefaw that the confequences in the end might prove fatal to themfelves.

On the 23 d of June, Boilfy d'Anglas prefented the vews ${ }^{12}$ report of the committee relative to the plan ot a new fetution, contitution. It was, like its predeceffors, prefaced with a declaration of the rights of man, confiting befides of 14 chapters on the following fubjects :- the extent of the republican territories, the political fate of citizens, primary aftemblies, electoral aftemblies, the legiflature, the judicial authonity, the public force, public inftruction, the finances, foreign theaties, the mode of revifing the confitution, and an act that no rank or fuperiority thould exilt among citizens, but what might arife from the exercile of public functions.

The legitlature was compofed of two affemblies, the Made up of council of the Ancients, confifting of 250 members, as tw? iffem. none but married men and widowers turned of 40 blies. could be chofen nembers of it; the other council confitted of 500 members, and enjoyed the exclutive privilege of propoting the laws, while the council of Ancients might reject or oppole, without having power to alter the decrees. The executive power was intrufted to five perfons who were to be 40 years of age at leaft, and to be denominated the Exccutize Directory. The two councils had the power of electing its members, the council of five hundred propofing 10 times as many candidates as could be chofen, and the council of two hundred and fifty felected the five members from among thefe 50 candidates. One member of the directory was to go annually out office, by which they were all changed in the courfe of five years. In enacting laws the directory had no vote, being appointed purely to fuperintend the execution of them, regulated the coining of money, and had the difpofal of the armed force. The treaties made by the disectory with foregn courts were not binding without the fanction of the legiflature, and war could not be made without a decree of the two affemblies. The whole articles of the new conftitution underwent a feparate difculion, when they were to be tranfmitted to the primary affemblies for their approbation. Prior to this event, however, it was agreed on by a majority of the convention, in order to avert the danger which now threatened themfelves, from the lofs of public favour, that at the approaching general election, the electors thould be bound to return two thirds of the prefent neembers, and if this failed, that the convention themfelves might fill up the vacancies. Ihefe decrees accompanied the conflitution ; but at Paris the idea of re-electing two-thirds of the old members was ejected with contempt, and the abfurdity of it pointed out with every exprefion of acrimony.

The convention in the mean time did not fail to Fretiom publith the approbation of the decrecs by the primary abridsed by affomblies, as well as of the condtution, although it is the con-

Trasee. certain that vaft numbers had confounded the two together, and given their approbation accordingly. Such was the rage of many againt the convention in confequence of the decrees already mentioned, that it was even propoled to try the whole members before a new revolutionary tribunal, and punith each in proportion to his crimes. The fections remonitrated againit the decrees to the convention, and the more eager they appeared in the buineifs, the more perfuaded was the convention of its own imminent danger. Every remonfrance, however, was difregarded, and the contending parties formed the refolution of fettling it by force of arms. About 100 elcetor, of Paris met in the hall of the theatre in the fuburb of St Germain before the day of meeting which had been appointed by the convention, and having chofen De Nivernoi for their prefident, began their debates, abfurdly concluding that the fovereignty was velled in the hands of the electors, after thefe had been chofen by the paimary fections. A body of troops was fent to difiolve them as an illegal affembly, which was accomplithed without any difficulty, the citizens not having been unanimous in their fentiments refpeating it.

This, however, did not prevent the fections from prefuming that by fteady perfeverance they would be finally victorious, having always found that the party favoured by the co-operation of the Parifian populace, had carried their point ever fince the commencement of the revolution. The armed force with which the convention was furrounded gave the people very little alarm, as they endeavoured to perfuade themfelves that the military could never be brought to att againft the citizens. As the members of the convention alfo appeared to fufpect their fidelity, they applied for aflittance to thofe very Jacobins whom they had humbled on the 24th of May. If the fections of Paris detefted the members for their connexion with the atrocities of Robefpierre, the Jacobins admired them from this very circumftance; a fet of reftlefs, bloody men, who were never fatisfied with wars abroad nor revolutions at home. Hundreds of them were relealed from priton, and put in a fate of requifition for alfifing the legiflative body.

The fectivns of Paris having beheld the convention furrounded by mea who had juitly obtained the appellations of terrorifs and men of llood, they exhibited a defire of engaging them which was altogether unbonded. Their leader dengned to make the members prifoners, till they could be conveniently brought to trial, and in the interim conduct public afiars by committee of the fections, till a new legilative body could be chofen. General Miranda was to have the comwand of the armed force after the overthrow of the convention, but as it was fill problematical which party would be triumphant, he retired to the country till the event hould declare is, refolving to flare the reward of a conqueft to which he was to contribute nothing. The fuperior officers of the convention were unfaithful, yet the fubalterns and foldiers misht have continued frm, to which they sould, no doutt, be ftrongly exthorted by their Jacobin auxiliarics. What was greatly in favour of the convention was, that the firl moments of enthuinafn were permitted to palis away, after which the fections exhibited a condert both endecided and neat.

Barras was appointed on the $4^{\text {th }}$ of October by the convention to the command of the troop, Generals Menon, Raffet and fome others, having been difinifled 1795 . from othice. Barras called in the aid of the molt able Barras 4 officers, among whom we find Brune and Bonaparte, apponted and made fpeedy preparations for a vigorous defonce. the chir? Troops with cannon were planted in every atvenue lead- ummand ing to the Thuilleries, and malked batteries were placed the nain fituations of a more retired nature, if anv of thefe toral thould happen to be forced. The precaution was alfo taken of tranfporting the provilions and military flores to St Cloud, if the convention thould be obliged to retreat from Paris. On the 5 th of Oztober both partic, continued on the defenfive for feveral hours, Lut about three o'clock in the afternoon, overtures were made by the general of the infurgents, Danican, in which he declared that the intention of the citizens was for peace, only they apprebended a maffacre was to be begun by the armed terrorifts furrounding the convention, and that if thefe were removed they would return to their duty; but it was refolved to try the iflue of the difpute at the point of the fword, as the Jacobin party in the convention were now more fully perfuaded of ultimate fuccefs. On this occafion the armed Jacobins without are generally undenfood to have been the lirit aggreflors. The citizens on the louth fide of the tive made an cffort to reach the convention by the Quay de Voltaire, but were completely prevented by thi cannon of the convention, while the contlict was extremely obitinate on the cther flde of the river, near the convention. After an engagement of four hours continuance, the fections were repulfed, and driven to the porl of St Roch, which being allo taken after an obitinate refiltance, the infurgents hed to their head quarters at the fection of Le Pelletier; but the troops of the convention were, about midnight, in polfelion of the whole city.

4:5
The victors attributed this infurrection to the in- The viven: fluence of the royalifts; and whether they were right lacobim in their judgment or not, it is certain thes the caule of thate teal. royalty was now become lef odious to the people in general than the bloody extravasance of republicanim; but the mob in fact feem to have looked no farther than the difarming of the Jacobins, and obtaining new reprefentatives, The attempt failed, and the Mountain were again at the head of the ilate. The fittings of the convention were terminated on the 27 th of OAtober, and was fucceeded by the new le.inlature in termo of the conftitution. Among its lat decrees, was one granting a general amnelty for all crimes and proceedings of a revolutionay nature, but the emigrants, tranfported prieits, and every one concerned in the lat infurrection, were excluded from the benelit of it. The agents of Robefpierre in Paris and the departments were liberated from prifon, and pronncted to lucs tive ofices under the new goverament.

The next ftep of the: new le ilheture was to divide Meaturey on itfelf into two commeils, an! fucsed to the clacition of the tee: an executive directory. The culacil of five huadredes.tan are was bound to prefent to the vther council 50 candidates, of which a litk was accoidiagiv made out, confilking of no more than five whom they withed to be chofen, the other 45 coniliting of obicure perfons, farmers and peafants, which left no mure power to the souncil of arcients than the form of an tlection, which

Ereaty of
peace wit Psuifia. Lequay, and Letourneur de la Manche, none of the rett luing qualified for the office. The intriguing Sipves, horicter, did not deem it prudent to venture on the polithon of power; and on his declining to accept of thi new dignity, Carnot was appointed in his 1. it. The form of acemment now etablihed did ret promife to be productire of much happinefs or tranquillity, as the moft important offices in the flate were t.lled by men whom the people could not endure. The nembers tio of the executive directory, except only Reveillere Lepaux, had always been connected with the Mountain party, and they employed the Jacobins in almolt every official department, which could not fill to render the government peculiarly obnoxious. It vias feared that a directory chofen by the Jacobins, and new legillators appointed by the people, might one day be the means of totally fubverting the conftitution, which actually took place.

On the :cth of April a treaty of peace with the King of Prufia was prefented to the convention, in order to be ratified. By virtue of this treaty, it was agreed that the republican troops fhould be immediately withdrawn from the territories of Pruffia on the right bank of the Rhine, having power to retain, till a general peace, the territories which France then pofiefled on the left bank of that river. There was to be a mutual exchange of prifoners of war, and the intercourfe between the two countries was to be placed in its former fituation. Meafures were alfo adopted to fhift the theatre of holtilities from the northern parts of Germany. At the fame time the king of Sweden acknowledged the French republic, whofe ambaffador was received at Paris with great folennity. Another treaty was concluded with Pruffia in the month of May, which had a feecial reference to the line of neutrality. The cantons of Switzerland followed the example of the king of Sweden, and a treaty of peace was concluced at Batle on the 22 d of July, between the republic and the court of Spain, in confequence of which France gave up all the conquefts the had made in that comentry, and the original frontier was refored; in return fur which the republic received all the Spanilh part of St Deningo. In this treaty the Dutch republic was included, and the mediation of the king of Spain, in favour of Portugal and the Italian princes, was accepted by France.

On the oth of June, the dauphin, the heir to the throne of the unfortunate Louis XVI. and his only fon, died in the prifon of the temple, where he was confined with his fiffer fince the death of the king. Some think th. t his death was the confequence of difeafe, although it is much more probable that he was poifoned, fince there is no crime in the anmals of human depravity which the French rulers would have trembled to perpetrate, of which the numerous murders already detaile. afford indubitable evidence. His death, however, interetted the Fret.ch nation fo deeply in favour of his bataroufy ufed family, that the convention found it tradent io liberate the princef. The committee of fu'lic fifety profored to the emperor to give her up in C. hange for the commilimers whom Dumourier had fent grioners to the Aulrians, together with Semonville and Marat, who were feized on their way to Turkey an envoy, extraordinary from the Fretch republic.

The propofal was agreed to, and the exchange tock Frarce: place at Bafle in Switzerland.

If Britain was unfortunate in her aff.ies on the continent, fhe flill retained her fuperiority on the watery element. A fleet under Admiral Hotham ergaged a French fleet on the $14^{\text {th }}$ of March, and took two fail of the line, the Ca Ira and Cenfeur; but this was nearly counterbalanced by the lots of the Berwick and Illuftrious. Three French thisp of the line were captured by Lord Bridport on the 23 d of Jone, in an attack on the enemy's fleet off Port L'Orient, the reft of the fleet effecting its efcape. As Britain thus evinced upon all occafionsher fuperiority by fea, advantage was taken of this circumflance to fend affiftance to the royalifts in the wettern departments, which unfortunately for them came too late, for the convention had offered them a treaty which was accepted and figned at Nantz on the 3 d of March, on the one part by deputies from the convention, and on the other by Charette, Sapineau, and other chiefs of the infurgents of La Vendée, and by Cormartin, as reprefentatives of the party called Chouans or night ou/s. Stofflet fubmitted to the republic on the 2oth of April. The countenance given by Britain to the royalifts made them difregard thefe treaties. The troops fent to their aid were compofed of emigrants in the pay of Great Britain, and a number of prifoners who agreed to join the royal caufe. Puifaye commanded this motley army, and Count de Sombreu:l afterwards joined him with an inconfiderable reinforcement. This expedition arrived in the bay of Quiberon on the 25 th of June. Arms were put into the hands of the inhabitants of the country, but it was foon found that they could not be of much advantage to regular troops. A refolution was therefore adopted to withdraw the emigrant army within the peninfula of Quiberon, the fort of which name was taken on the 3d of July, the garriton of which confifted of about 600 men, and was afterwards occupied by the emigrants. All the polts without the penimfula were carried by an army under General Hoche, the emigrants and Chouans efcaping into the boats of the Britilh fleet, or flying for protection under the cannon of Quiberon fort. The re publicans then beran to erect iormidable works on the heights of St Barbe, which commanded the entrance of the peninfula. To prevent thefe operations, a fally on the 7 th was made from the fort, but without effect, and another with ftill greater force had no better fuccefs. The whole forces in the peninfula amounted, including Chouans, to about 12,000 men, 5000 of whom vere fent to make an attack on the heights of St Barbe, where the republicans were entrenched in three camps, two of which were taken without difficulty ; but as the emigrants rufhed forward to attack the third, a malked battery was opened upon them with grape thot, in confequence of which a dreadful flaughter enfued, and very few of the emigrants would have effected their efcape, had not the fre from the Britihh flips compelled the republicans to abandon the purfuit.

It was now evident that a complete and ultimate failure would be the fate of this exfedition, and defertion among the emigrans became very frequent, efpecially thofe who had been liberated from priton on condition of ferving againft the republic. The weather was very tempettuons on the evening of the $20 t h$, which ind:ced the emigran: to indulge in a fatal fecurity. The troops

## $\mathrm{F} R \mathrm{~A} \quad\left[\begin{array}{lll}\mathrm{I} T\end{array}\right] \quad \mathrm{F} R \quad \therefore$

Frans. of the ropublic were conducted in flence along en man guarded quarter of rhe thore, and furprifed one of the
polls, where they found the artillery men alteep. "lin y extinguilhed the lanthorn which was intended to give the Britih llett the ularm, and feized on their mutches. Some of the emigrants threw down their arms and jined the republicans, while others maintained an obthate contett before they furrendered. Count de Sombreuil was taken and put to death, together with the bithop of Dol and his clergy, none being fyared but fuch as pretended that their appearing againt the republicans was purely owing to compulion.

But to return to the affairs on the continent. The fort of Luxembourg furrendered on the 7 th of lune, after having been belieged lince the precedin compaign, which put the French in poffethon of the whale left bank of the Rhine, Mentz on!y excepted, becaute the Autrians could conveniently fupply it with every recellury from the oppofite bank of the river. The renublicans therefore determined to crobs the river, to iaveit it on every tide; but for fome time the attempt was delayed, till the refult of the Quiberon exnedition thould te fally known. The paffage of the Rhine at Duffeldorf was effected by General Jourdon in the month of Auguft, as con:mander of what was denominated the army of the Sambre and Meufe. Having driven three Autitian potis before him, he crotred the Maine, and inreited Mentz and Cafitl, and Pictecru at the fame time took poffeffion of Wanheim, having croffed the river near that city with the army of the R hine and M felle. A ftrong detachment of this army having driven Marthal Wurmier from an important polt, began to plunder, and conlequently ran into confution, of which the Aultrians took a proper advantage, returned to the charge, and the renublicans were vanquibed. Jourtan was purfued by Ciairfait to Duffeldorf, where the former general made a ftand, and Pichegru recrofted the Rhine near Manheim, lesving a garrifon in that city of 8000 men, which, atier a vigorous hege, furrenderel to the Autriats; and the republicans were driven from the vicinity of Meritz. Little more was either lots or won by the contending parties at this time, and they mutualiy agreed to an armitice of three month.

The landgrave of H Fle Calie! entered into a are ${ }^{+} \mathrm{y}$ of I eace with France on the 25 th of Augut, which was agreed to, on condition that lie would furnith Britain with no more troope during the war. Pedce upon fimilar terms was granted to the elector of Ilanover; and the duke of Wirtemberg and tome other princes of the German ermpire begon to twat ; but the negncistions were irwien of in contequence oi the reveric of fortune which the French nove experinced.

The directory, hovever, atili refolwal to prolecute the war with vigour, and therefore made sate preparations during the winter tor another compai, 11 . The Mountain party being thain pollelled of power, forn besan to dilcover their ralke, turbulent difpofition, which could not long fubmit peaceably to any posemment whatever, and became difulfed with that very directory which they themfelve liad ellablihed. They vete perpetually dilur! ing the nublic tran uillity. The people of Paris, after the 5 th of 0 ) -theter, durli not upedy avow their abhorrence of the Jacobin, but it was adiketood that their wearing green ctaselt was a - oken of contempt. Natrona: in?sute eftablibucd.

Another matier of no lefs a ferious nature now calsed for the attention of the republican governmen, which was the deplorable fate of the inances. White the tyrannical ufurpation of Rebefierre continued, terror fupported the credit of the ahignats, which joined to the fale of the church lands, and the property of the emigrants, furnifhed ample retources in the mean time; and no provifion was at all thought of foc future exigencies. If money was wanted, more atfignats were fabricated, and no eaquiry was made concerning the public expenditure, as no texes vere demanded fiom the people. The directory complained to the councils of the great diftrefs under which they laboured, and of the want of fufficient furds to meet the unavoidable expences of the enfuing campaign. A law was in confequence pafed on the 2 sth of March, giving authority to difpofe of the remainder of the church lands at the value formerly fised on them. which was 22 years purchafe. A new paper curreas, termed mandat, was to be rectived in parment. but governmen had now loft its credit. Thefe rapidly lot a great past of their value, which increafed the demand for national property ; and to prevent this, the leginature decreed that one fourth of every purchaie fhould be paid in cath, which prevented the fale of the national property, and the circulation of mandors.

During their prejarations fur the approaching campaig, the directory att mpted to render themfleses popular at home, by the ellablifment of the Nationcl In:/izizie, or focitiy of men of letters under the protection of government. Every man of erudition who had efcaped the bloody perfecution of the Mountain paty, was invited to be a member. It was opened on the $4^{\text {th }}$ of April, in the hall of the Louvre, when the ambaffadors of Spain, Prulfia, Sweden, Demmak, Holland, America, Tufcany, Gcnoa, and Geneva, were prefent, and the members of the directory in their robes of flate. The prefident expreficd the determination of the executive power to afiord every encouragement to the improvement of literature and the arts; and the prefident of the inftitute reflied that it was the determination of the members to endeavour to give luftre to the republican government by the exercific of their talent, and iv publications. The feeches were emhuliatically applauded by t 500 fpectators, and the general expectation wa. that France was now to enter on a cazeer of glory and profpeciiy wholly w.precedented.

About this time an approach towards a regotintion with France was made on the part of Great Britain, by Mr Wickham, ambañador to the Swi's Cantons; and on the 8 th of March, a note was conmunicated to M. Barthelemy, ambaffador from the French repullic. It was alked, whether France would be willing to fend minifters toa congrefs to negotiate peace with his Britannic majefly atd his allies? Whether France would be inclined to commuricate the general grounds on which the would be willing to conclude peace, that hix majelly and his ailies might confider them in co:cest ? L.ifty, whether France wrould defire to communicaie any other mode of accor:plifing a peace? Whatever anfwer hould be returned was to be tranfmitted to the Britih court ; but it was at the fame time declared that Mr Wiekham had no authority to difuls thele migict: An anfwer was
returned on the 26 th of the fame month, by Barthelemy Fratce. in the name of the directory, complaining of the infincerity of the Britilh court, as its ambaffador had no au-
1796. thority to negotiate, and that the propofal of a congrefs made negotiation endlefs. It ilated the wih of the directory to obtain peace, but that no portion of territory would be relinquithed, which formed part of the republic by the contitutional decree. To this note zo reply was made; but it was complained of to the foreign minifters refident at the court of London, and confidered as leaving Britain no other alternative than the profecution of the war, at once both jult and nectilary.

During the winter feafon, the direciery found means to reduce the weftern departments to proper fubjection. The expedition from England had tempted the royalitls cnce more to thy their fortme in the hield of bathe ; but arter a number of defeats, their leaders Claretie and Stofltet were apprehended, and put to death on the 29 th of March, which tendel to fupprefs the infargents in every quatter. Dometlic enemies being thus fuldued, the refublican goverument was enabled to make the more vigorous eiertions on the frontiers. Thair military force was divided into three ampics ; the arny of the Sambre and Meufe under Jourdan was principally flationed about Duifeldorf and Cobientz; the ammy of the Rhine and Mofelle, commanded by the celetrated General Moreat, fationcd on the Upper Rhine, and from Landau to Treves; and the third army occured the Italian coalt from Nice towards Genoa, the command of which was beitowed on Bonaparte, a native of Corfica, and one of the molt extraodinaty men that ever lived in any country, as our readers will perceive in the fequel.

The army of Italy about this time was $56,=00$ ftrong, which Bonaparte, at his arrival, found wery ill equipped, and in a flate of mutiny for want of fay a necellaries. Wifling them to propare for inmediate acion, he addrefled them ia the following manner: "If we are to be vanquithed, we have already too much, and if we conquer, we thall want notling." He was anticipated by the enemy. The Autrians empleyed in the cefence of Italy under Beaulieu were more mamercus than the army of Bunaparte, to which were added 60,000 re\&ular troofs belonging to his Sardinian majelty, the rilitia of the country, and about 2500 Neapolitan cavalry. On the gth of April the campaign was opened by General Beaulieu, who attacked a polt called $l^{\prime}$ oftri, in the poffeffion of the republicans, fix leagues from Genoa. They defended thenfelses till the evening, after which they retreated to Savona. Next day BeauJicu fucceeded in all his attempts, till he reached Montenotte, the lait republican entrencl nent, which contained 1500 men. Rampon, their commander, prevailed with them in a monent of enthufiafin, to fuear that they would not farrender, in confequence of which they fucceeded in arrelling the progrets of the Auttrian ecrecral for the remaking part of the day. The right wing of the Jrench anny was, during the night, flationed in the rear of the redoubt of Muntenotte, under La Harpe, while Bonaparte, Mailina, Berthier, and Saiieetti, advanced by Altara, to tike ti.e eneny on their flan and rear. Powerful reinfurcements wcre in the mean time fant to Bcaulieu, who, on the moming of the 11th again made an attack on La Harpe; but the apprea th of Miffens foon made the Auhrians and Sardi-

a-decimo fore-d hy Angertat.
wims give wisy on ell fiter. Twn of trat fener! were wounded, 2500 were nates prioner, and the republicans purfued them beyond Cairo, which, on the following day, fell into the ir hands.

General Angelvau, on the 13 th, forced the detiles of Milletino; and by a rapid movement General Ptovera was furrounded at the head of $15: 0$ grenadies: ; but inteat of furrendering, this brave othicer forced his :way through the enemy, and entrenched himelf in the ruins of an old caftle at the ton of the hill. Angureau, with his attillery, endeavoured to dilludre him; atter which he arranged his troors into four columns, and made an attempt to carry Provera', entrenchnents by form, which proved unfucetsoul, but the French hal two generals killed, and Joubert was wounded. The adiverfe armies faced each other on the 1 qth, while a divilion was left to continue the blockade of Provera. The Autians made an unfucceffral attack on the repabidan centre, while Malkena turned the left Hank of their left wing in the sicinity of Dego, and La Harpe turned the riglt flank of the fame wing. One column kept in check the centre of the Auftrians, another attacked the tlank of their lett wing, and a third column gained its rear. The republicans took $y=00$ prifoners, and General Provera at laft lutrendered.

General Beaulieu, after he was defeated at Millefimo, made an effort fimilar to thofe which have been freque:tly found to change the fortune of war. With zose of tris beft troops he made an attack upon the village of Degn, where the republicans atter their fuccels were indulging in fecuity. He made himfelf mater of the village, and the troops having rallied under Mefena, that general employed the greater part of the day in his efforts to retake it. The republicans were three times repulied, hut Bonaparte having arrived in the evening with reinforcement, the poll was retaken, and $1+50 \mathrm{~mm}$ wete made prifoners. Bonabarte was now, by defign, between the Auflrian and Sardiaian armies, his right wing being fecured by the village of Dego againil the eflorts of Berulieu, while lee could act againut the Piedmontele troops with the greater part of his force. Angereau poserfully fecoaded his exertions, who had opened a conm:unic tion with the Tanaro, where Serrurier was approaching the town of Ceva, in the vicinity of which there was a Piedmontefe entrenched camp of $\delta \partial=5$ mon. The re doubts covering this camp were, on the 16 th , attached by General Angereau, capturing the greater part of them, on which the Piedmone ele evacuated Ceva during the night, and, on the $1,-1$ Sernutier entered it in triumph. Count Colli replited Serruier on the 2 , h ; but Bonaparte, on the 22 , devated him a+ Mondori. The flying army endeavoured to make a lland at thaf fano, it winas being at Coni and Cherafc, which litter Phee was taken by MI Hena on the 25 th, when Collano wa aken by Serrurier, athd Alisa by Ancereau.

Pris to the motement, at anditice wa requelled bs Count Colli on the 23 d , which Geteral Bonapattic granted, on c nditi.n that the for reffes of Coni, Cers, and 'lortona, fhenid be given up to him, with their mavazines and artillery, and that he floold have germillion to crots the Po at Valentia. The armitioce was figned on the 29th of April, and a debintive treaty was concluded at Paris on the $17^{\text {th }}$ of May. The conditions, in fo far as they concerned his Sardinian majefty,
wore inqueitionaty humilizeng, the su hy of Sa:oy was given up to Franee for encr, as were alo the cou:i--ins of Nice, leace, and Bre"ueil. In ammefly was t.ges. F:anted to all i::s fibjects nho were perie-...el for priltwal opinions, and fie ascred that the Fench tions hould have free arcels in Italy through bic turriory: He wa, to erect no fortrefles on the fice of Fance, to demolilh thoie of Brimete and Sufa, and co: Selts bat his conduct to the lat reprbican ambatide hat been direfpectful.

The republican army, in the mean time, acvareced a 4.4.ns towards the Po; but Beanlieu wai deceivet refpecting "raty. one article of the armiftice, which granted permitho:1 to Bonaparte to crols that river at Vieatia. Concluding that the republican chief feriouns i:tended to crofs at this place, he made every polible prearatio: to ofpofe him, while Boraparte hattily penerated into Lombardy, and, on the 7 th of Muy, was 60 miles down the river to Placentia before the enemy conlt cotam information of his route. He paffed the siver without dificulty. Six thoufand intantry ani zooz caviry were difatched by Beaulieu to oppole tice funge of Bomaparte acrols the river whe: it was too tote, by whom they were net and defeated on the i.llowind day, at the village of Fombio. A: 5050 noore ad. vanced to the allitance of the fe, they were repulfed by La Harpe, at which time that "thicer was killid. Ais armiltice was granted by General Bonapatte on the oth to the duke of Parma, on condtion that he paid 2,002,000 of French money, and delivered $10,=00$ quintais of wheat, 5000 quintals of oats, and 2050 ove: tor the uie of the army. He likewile agred to give up 20 of his be:t paintings, to be made chcise of by the republicans. This latt meafure was itrongiy objectea to by feveral men of literature and artits as foon as it was known; but the directory difregarded every remsi:f.rmence, and geve orders for fimilar itipulatious to be inferted in every fubfequent treaty.

As Generdl Beaulieu was forced to abandon the Po, Viatuy he croffed the Adda at Lodi, Pizzighitine, and Cre-Lit: mona, leaving fome troops to defend the approache to Lodi, which were attacked by the advanced wi:d ot the republicans on the roth, who drove them into the town, ::nd purfued them fo rajidly, that thote wn, nu time left to brak down the bridgre over the Alda. Here the Aultrians defended the pallige with 30 pieces of camon, and the remublican olifers, atter holding a confultation, were of opimion that the bridge cuild inet be forced. Bonaparte, however, havin dena dad ar his grenndiers whether they were vily th mane the attempt, they commonded the propolil, on whilb he furnue! them into a clote columa, when they i. : ${ }^{\circ}$. 1 themfelves of the darknets occanioned io the dis dee es thee emeny's artullety, and reached the nain the of the brilge underceived, where 700 of the: praithed by the Abtrian common: but a mumber of republicen onticers flow to the head of the colum, ursed on the brave foldiers, broke isto the Aulrian rank, and made them diy in all cherections.
it appenr that nothing more was expected from the lad con:campaign of Bonaparte in Italy, than to imbuce the dit- fuenees v: fromat princes add itates to abandon the codlition, yaint ${ }^{\text {t. }}$. Irance, which every one of them affinted eitlee with troops, or with money and provifions. He made himfelf mafter of Ferrua, Bologna, and Urbiso, granting X 2

$\because$to hin Mances and the duke of Modena a armintice cn the utwat tome, we mean large contrilutione, paint. i.s.s, and curioutis. 'i he Neapolitan cabinct was fo terrificd in contequence of his narch into the Roman :orritory, that it refuefted a peace: and Bonaparte Fareed to an armilice witheut any of the hun:liating coditions deranded frem the ether fiates of Italy. He ne:t proceded to Leghom, in the neutral flate of Tufany, in order to drive ont the Englifh, and confif rate their $\mathrm{P}^{+0}$ orty. In thi namer did be liain the tidh alligned lim, before the commencement of the campaiga on the Rhine. It is true that M-ntua was fill in polemion of the Inperial troups; at it was in a fate of fiece, and the reti of Italy was fubmilfive to the Frend repulic.

Wha a vew to lefen the exertions of the reval licans an luay, the content in Gemany was resered ty the
forcenciat, wion the fort and redoukis wese craricd peanee. by itorm, and the Autrians retreated toward, Offonbur l:.

In coniequerce of the arcl dute's departure to the Lumer Rhine in purtuit of Gor.ral Jourdan, and the ${ }^{2}+9$
 detacronneas int to ltaly to chech the viotorious carcer y Moreats ot Buaparte. Gencral Morcau was in a firuation for entening Swatia with a iuperior force. On the 26 th of
 don their c:mp of Wihte ${ }^{3}$, and next day proceeded with his army in three columns, agnint another body of 15,020 men before OfenLurgh. A detachment from General Warmier was lent to their afilance, but thele being defeated on their march by two republican columns, and Offenburgh was evacustud curing tise night. The mountain of Knubis was reized on the zd of buly by a Ludy of Fromb mader Generai Latoche. This is the lofieit point in that rifge of nount ais deromina ed the Blate $F_{0}{ }^{t}$ f. The Aunians were sent day driven
 ance, by which their comranication with the eniur...": under the Frince of Concé was entirely cut off. Bue Auttrians were attac!od at Kattadt on the 8th by the left wing of the republican army, commanded i: the gallant General Deĩaix, and, aftur a roull obitibate seinlance, were obliged to retreat to Fitingen.

The archdake now arrived with his army on the Tine Freath Lower R bine, leaving Wartendaben to check the pro-trer gref of General Iourdan, who began to act upon the Franisort. otenfive as toon as the archduke departed. Genera! Kleber, as be ore, fet offifrom the lines oi Dunleldorf, and the centre and right wing crofied the Rhine in the vicinity of Cobientz. The French forced the pots of Chareth and Aiteohirchen, and ti.e whole arny under General Jourdan crulied the Lahn on the gth of Juis, and next day Wartent!eben was defiated with great flaughter, and the lufs of $5<0$ men aken prifoners; ath the republicans entered Frarkfort on the $12 t h$. Ihe two imperial armies were now not far from each other, being in the centre between tho of Moreau and Jourdan. Had the archduke found it practicable to refilt for a litile onc of thefe two armies of the French by a detachment, while he ruthed upon the other with the main body ot his army, it is not improbable that an end might thus have bee: put to any further invafion of the Germanic empire; but the activity of the republican oficers was not is eanly checked, nor could their progretr be arrelted by any partial exertions. His latt refource, thetciore, was to give Lattle to Noreau, whirh was mon obitinarely fought on both fiden. ' F he French, in their cndeavours to force the heights of Rollenfolhe, were four times repulted, and, atior a molt terrible flaughter, they carried the ficld at the proint of the bayonet.

In confequence of the lut they futioned at the battle the 4 arch of Ettingen, the two imperial armies recired ealtward, lake rethe archdike retreating through Swahia tonards CYm, reats where he had magaines. At every pott of any itrength through he made a ifand, in order to obirect General Morean's 'wabay progrefs as much as pollible, Wistendeben, in his retreat thro:gh Francomia, made a fimilar oppolition to the march of Jourdan, The archdake was forced by Moreau to crofs the Neckar, and atterwards the Dinatic, by which mown the whole circle of Swabia was in the reat of the republicans. Wartemleben was forceu

 ture, and 1ion obfiged to crofs the Kednite, an onvor (1) ifan the army of fourda, which wa petine on ha, rede. Jousdars continuald to advine, till nis risht wind, commanded by Gener.l Bernatove, wa poltal
 whin body of the amy purlued Wurimateon teemal the Nob, hatiag arrived at Am'ers on the 224 oi Au, Wh.

Ine three repablican armies commanicu' Ly Mureau, Bonaparto, and drardan, were poriolled of the whoce country from the fromers of Bomma to the A iriate, cxeepting only a part of the mountains of 'Ayrol, which caulded an alarm throush the whole of Gerruny. The payment of $4,200,0=2$ of Irench moncy procured a peace for the dithe of Wirtembers; and the rircle of Sivajia onatned, on condition of patiaes $12,000,000$ of liver, and deliveritg $8+00$ hoite, 5200 oxen, 100,000 quintals of whe t, 50,002 子1int.hb of rye, 100,50 fuel.s of oats, 100.000 pains of thoes, and a lace quantity of hay. Peace was granted to the marerave of buien upon dimilar term. Nacociations were allo entered into by the ciector of B varid and the circle oi Fratcona, havines oftered lote e fums in order to procure it. Even the det of Ratibbon fent a dejuation to the reabliran generals to treat for a nedtraliv. S ain made a treaty with Frano, both offanive and detenine, and war was in confequate doun atter dectarel againt Coat Beitain.

Bonaparic wa, detmel Itill in Ituy, whereas hal it been in his power t.3 coot the I'yrol at Intpruch, and reach the 1 ) muber, it is mure that probsie that the emperor of Gemmay whid have been oblised to accent of a peace uron any term, which the connurors thungh: promer to propole, $H$ van now a'maduad by every matyer of the conilion. Bitain alone excepted, whole pectunary aid eatled him to exticate him-1-if from the dagers whin farrowded him. A command of money ratied one arany ater another to caeck ile career of Bonayarte in Italy, while his Germon armien were recruited by extentive levies, and mercenary thoops belonging to the itates which had made peace wih Irance.

The archduke Charles laving receised ftrong reinfurcements, cam to the relolution of oppoting Aloreau at Umerhein. A defperate baitle $w$ of of coniepuence Sught, of 17 hours coatinumee, when one of the wings of the Autrian army fucceeted in gamiag about four lengues of territory in the rear of the republican army; Lu: as the archluke was inturmed that Warteniluben could rout manatan his amund agant the efforts of General dourdan, ior iecmed it prudent to retreat, and adopt rew meatio. On the rith of Ausult, he left Gereral La leor to be a check upon Woreau, ard crolfing the Dansise It Imshliadt, lie marched the the rwicf of Genersl TViatcmikhen, and whith unted forcen determined to f...l wond durdan. On the azd he mate an ittack umon Lermedor': at 'Tening, whom he comfethed to retrest vo: ard Nurcmberg. 'i he ar hdane was now on the rinht of J, ndan, and Whatenflefon wa in irent of hirs, which induced the Fieneh commande to retreat on the 2 gth. Such was the thate withe Ireach frances at the beginning of this campaige, tilat the arkies of Jourdan and Moreau were $\because$ : Pa nemetity of phondering wherver they came,
 laty the caie wian I andats army, which when it befian th retrett, futticed almolk is murh from the ex aptuted inhatitants as tom the oppation army. The

 tomer. In thi, Goncral Jourdan wiat the grentent noteler, and he comened his retreat durimg the nighe. 11-wher crolied the 1 . im, he made a feetife reftetace, amd manhed aing the bank of the Rhise, till his amms. on tice $1-: / h$, arrived at Coblentz and Dufichurt. thum which it had formerly departed.

The army of Mostan was now in a fituation ex- va sis trome's perious, yet he mantance his polition till the riturtion 1 hith of september, the very day on which Jourdan hathly cr. reated Duthenof; but he was obvioully in a waver- twal. ing cumbition as to his future movementc, and one of the seated generals Europe ever belseh was now at a lus what itep to take. He made an unfucceffolu ef Lurt to dran the archduke from the purfuit of Jourdan. Mny attach, ritre made upow him, but without effect; and the Aultian generals gave way to him wherever he turned. But finding that the retreat of Jourdan was irretrievealie, and that General bonaparte was 1 lill detmined in Italy, he finally refolved to retreat. Io prepare for this arduous undertaking, he had croffed the $\mathrm{H}_{5}$ 4:6 anLech, which he fudcenly repafied, as if fully determin-paralleted od to penetrate farther into Auftria, and compelled Latetrat. Tour to fail bach to Ladmerg. Having thus obtain. ed a iree pankge for his future movements, he began his ever memorable and unexampled retreit, paffing between the Dambe at Ulm and the lake of Conlance, while La Tour continted prefling upon his rear. The pans of the Black Foreft were occupied by mumerous bodies of Autrians and armed peatanty, while his rizIt tlank was harafled by Generals Nauendort and I'ctalalih, at the head of 24,000 men. He turned onec more upon La Tour with terrible impetuonty, defeated him, and took $500=$ puifoners, whom he was able to Eary to France. He ifter this continued his retreat, cheching Nawendurt and Petrafch with the ti,ht wing with amy under Genal Detlain, ard the reft of the arms cleared tl e parnges in fron, till be reached the Valiey of Hel!, a narow defie extending for fonc hasues letween lofty mountain, and in particul or par:

arciscuk formed the refolution of temminating the canpaign by the reduction of Kehl and the fortification at Himmgen, which he iound to be no eafy tak. At both thele places a commonication was open with the French tide of the river, and the divitions of General Morcau's army did duty at them alternately. Much of the winter was fpent by the Autrians in endeavouring either to carry them by form, or to reduce them in confequence of a regular liege. The French at laft agreed to evacuate Kehl on the 10th of January, and the fortifeation at Huningen was furrendered in the month of February.

Althong, the republicans in Germany experienced very contiderable reverfes of fortune, as we have juft now feen, yet Bonaparte in Italy continued victorious. Haring laid all Italy under contribution, he enjoved the means of preferving a fecure and Ateady difcipine over a well paid army. The mode of fighting which he adopted in all defperate cales, was that of the clofe column; the favourite method of Epaminondas and Guftavus Adolphus. The ftile, too, in which he addreffed this army betore any great action, was well adapted to infpire them with enthuiafm. His fpeech to his army when he firlt entered Lombardy, deferves to be remembered. "Soldiers, you have rufhed like a torrent from the fummit of the Appenines, you have driven back and difperfed all who oppofed your march. Your fathers, your mothers, your wives, your inters, your fweethearts, rejoice in your faccefs, and boait with pride of being related to you. But remains there nothing more for you to effect ? Shall pofterity reproach us with having found a Capua in Lombardy ? But I already fee you ruthing to arms; an ummanly repofe fatigues you, and the days lof to glory are lof to your felicity. But let the people be tranquil; we are the friends of all nations, and more particularly of the defcendants of the Brutufes, the Scipios, and the ilhutrious perfonages whom we have chofen as models. To reflore the capitol, to replace with honour the flatues of the heroes who rendered it renowned, and to roufe the Roman people, become torpid by fo many ages of Ilawery, fuch will be the fruit of your victories; they will form an epoch to pollerity, and you will have the immortal glory of renovating the faireft portion of Europe. The Frencls nation, free and refpected by all the world, will give to Europe a glorious peace. You will then rcturn to your homes, and your fellow citizens, who, when pointing to you, will fay, "He was of the army of Italy."

Bontarte took up the fint part of the month of July in commereing a regular fiege againt Mantua, expecting to be maffer of that city towards the end of the month. In this, bowever, he proved ton fanguine, for the military effonts of Aultria were very great, and the jecmisty aid of Britain was not refufed. Twenty thoufand troops were fent from the Rhime, beider valt numbers from difierent quartere, fo that he was obliged os raife the fiege, and provide for his oun fatety in the beit manner lu conk. Maffena was driven from his post at Lai Corona oa the 29th of July, while 15,000 Auftrians drove the republicans from Salo, and next from Brefcia, with the whole of the fores and magazines belunging to the army of General Bonapartc. The Imperial troops, however, committed a fatal blunder in their plan of operations, by dividing into two
parts an army which, when united was a match for tie Fance. evemy, and placing Bonaparte between them. (): this blunder the 1epublican chief was fully awate, and did
1796. not fail to take advantage of it. He unexpected!y rail ed the fiege of Mantua, and leasing a firall body of troops to cluck the Autnians, he mar hed rapidly wettward, and retook Byelcia, xith the ragazines and hol pitals, on the $1: 1$ of Augulk. As lhe had the mais of his army with him, he excceded his etemies in rumbers wherever he attacked them. Fonning a large budy or his troops into clofe colun:ns, the Aulians exterded their line with the view of furtounding him, being not yet acquainted with his manner of fgating, by which means he pentrated their line in all directions, ard threw them into the greatelt confution. He made $4=00$ prifoners, and teok 20 pieces of camun. A divition of them finding Salo in poffeflion of the republicans, wandered about in fearch of a road, by which to make their efeape, when they fummoned Lonzdo to furrender, believing that the bulk of the French army had gone in fearch of Wurmfer to give him battle. This was indeed the cafe ; but Bonaparte was in Lonado with no more than 1200 mcn . Although this event no doubt gave him much uneafinefs, yet with great prefence of mind he threatened to deltroy their whole divifion for infulting the French army, by fummoning its commander in chief to furrender. The Auttrian officers believed that the whole army was in the place, fo that by this fingular ttratagem 4000 men were induced to throw down their arms.

Marfhal Wurmfer was attacked by Bonaparte on the De ${ }^{450}$ 5th and 6th, and driven from Pefchiera and the river Wurmfer. Mincio. The Autrians were obliged to quit Verona on the 7 th, and again to betake themlelves to the mountains of Tyrol; lofing in a conteft of fix dass upwards of 20,000 men, wut fortunately three-fourths of them were prifoners. The fiege of Mintua was again begun by the French, whofe works the enemy had doilroyed in their abfence, and taken 140 pieces of cannon into the city which they had left tehind. By this lofs, the French could not undertake a regular fiege, and General Wurmfer was in a condition to attempt the relief of it by the beginning of September. Honaparte having been apprifed of his approach, left troops behind him to carry on the blockade, while he directed his march northward with the main body of his army, drove the Auftrians from St Marco and Roveredo to the pafs of Calliano, where they made a ftand. Here an engagement enfued, in which the Auftrians loft 6000 men taken prifoners, and the French entered Trent in triumph. Inffead of retiring from the hero who had vanquibhed him, Wurnfer threw himfelf into Baflano, upon the tlank and rear of Bonaparte, and then marched with rapidity towards Mantua. He endearoured to make a fland at Baffano, but was defeated, with the lofs of 5000 men taken prifoners. He crofled the Adige at Porto Legnago, and entered Mantua with no more than 8500 men, infantry and eavalry. Great as this veteran's lofs was, it had the effect of detaining Bonaparte in Italy, to watch the mumerous garrifon of Mantua. He expected that its numbers would very foon reduce it by famine to the neceflity of capitulating, but in this he found himfelf difappointed, as the flefh of the 4500 horfes which Wurmfer earried into it, afforded fublifence to the troops for a long time.

from Bri$t \mathrm{tin}$.

Such was the fame of Bonapatte as a seneral, , in account of the vitories he obtained over the Autrian. that his coumrymen, the Corlicms, cricovered an inclination to throw of the Britifl soke, and be uaital to France. Tiney beame of confo io matmous, that the riceroy deemed it recentery to everuat: the inma, the fubmition of Italv to the "upublic hang are: 'g diminithed its value. The imperial iubject- in Itals, to. ge her wit') the inhobitants of Bolyna. lerrara, and Mcdena, now tegan to form themelver in'o uequits s, under the patronage of Gence.i Borsparte : the y fint deputies to the convention, ained truap, and abulined all orders of notility.

The emperor foon after endearoured to telieve Mantua, by fending another arniy into It,ili, under the command of Gencral Alvinzi, who having crolied the Piava, was met by the republicans, and compelled to repafs the river. Davidovich whin his divilion havent driven the French down the Adige tonards Verma, General Bonaparte found it necefiay to concentrate this furces. He therefore left General Vaubois as a chuck to the progrefs of Dividovich, and marched in ferfon againt General Alvinz:, and was met by the Aultrians at the village of Arcole. As this village could not be turned fipeedily, on account of a camal, the Fiench were oblized to at:empt the palage of a narow bridge in the face of the Autrian fire. Their outicers ruthed to the head of the column which had undertaken it, but in vain endearoured to rally them. Ansereau advanced to the end of the bridge with a flandard; but he was fullowed by none, when the commander in chief hattened to the bridge, and exclaimed, Grenadiers, follow your gencral! They followed till within 32 yards of the bridge, when they were intimidated by the tremendous fire of the Autrians, and Bmaparte judyed is proper to fall back. In the evening General Guieux took the viliage at the hoad of 2000 men, but ag in 1eft the - luftrians in the poffetion of it. On the 16 h of November a defperate engagement took place in the vicinity of Arcole; and nest day the Auftrians prefing on the cen:re of the republican army, were unexpected1) taken on their lank by the left wing of the encmy, which was lying in ambuffade. Bonaparte fent a party of horfe and 25 trumpeters round to the rear of thic Autrian, who crefuled, from the terrible noife, that they were furrounded, and fled on all fides in the utmolt confulion.

Having driven Alvinzi acrof, the Brenta, Bemaparte returned; the potitions of Kivoli and La Corona nere refumed, and Davidovich drieen back ino Tyrol. Gereral Wumfer till defended. Mantua during the remaning part of the ? arar fot that nothing ferther may be taid to have been gained by fo many victories, but to confider Donaparte as their unly immatible commander.

During thefe tranfaction in the field of batie, Great Britain made a laudable effort to negotiate with Frasce. Pafforts wete obtained from the direaory, and loord Malmelbury lit out as ambalfador to Paric. He be::n the negotiation with De la Croix, the minitter for foreign aftiars; but his lorimip foon furend that the directory had no ferious intention of concluding a tre: 'y with Britain. France iervices for Italy. General ilvinzi's army was now 50,000 thong, with which he continued to alarm the republicans in all directions, in order to conceal from them the plan of his future operations. Bonapatte was 1 itll at Bologna, to prevent the efcape of General Wurmler by that quarter, which he underitood, by an intercepted letter, was his detign. Having beeu informed of the approach of the Autrian army, lie haitened to Mantua, and from that city to Verona, where the centre of his line was oppoled to Alvinzi; but as the Auftrians continued to attack all quarteis at once, he could not penetrate the defign of their commander. On the 13th of January the movements of the enemy became more ferious on the lower part of his line near Purto Legnago; but in the evening being informed that the upper extremity of it under Joubert, had been attacked by vaitly luperior numbers, there he concluded that the Auftians were in greatell force. Still the Autrians pernited in the abfurd plan of dividing their army -an abfurdity which melancholy experience had not taught them to correct. Ten thouland troops, inCluding the Vienna volunteers, received orders to proceed to Mantua by Porto Legnago, at the lower end of the republican line, while Alvinzi in perfon advanced againlt Joubert, who was forced to retreat, and was recluced to fuch a fituation, that the capture of his whole diviion on the following day (the $1+$ th) feemed highly probable.

Bonaparte having received information refpecting the flate of affairs, left Verona on the 13 th, having urdered Maftena to follow him witl? the centre to Rivoli as f.it as polfible. On the $1 q^{t h}$, at the break of day, the divinon of Joubert made an attack on the Auftrians, at which they were very much furpriied, not knowing that Bonaparte had arrived with reinforcements. The fuperior numbers of the Aufrians defeated all the endeavours of the French troops to turn their divitions; and the two wings of the republican army were driven back upon the rentre in confiderable confufion. Alvinzi engaged the centre, which with difficulty maintained its ground; and the Auttrian wings advancing on both fides, entirely furrounded the French. The victory feemed already won, and it is even reported that General Alvinzi lent a courier to Vienna, to announce the approaching capture of Bonaparte and all his army. There can be no doubt that the repuolican chief was now greatly alarmed, yet he ftill confidered it in his power to make a lati eftont. Forming three ilrong columns, he difpatched them againtt the right ring of the Aultrians, which they penetrated at various points, and made it fly in fuch confufion that, having net a party of republicans which had not arrived in time to join the army, 4000 Aufians laid down their arms, and lurrendered themielves priloners of war. Bonaparte apprehending that this part of his line was no longer in danger, left Joulert to profecute the victory, and went to oppole the march of Provera. A party under General Murat having continued their masch all the night of the 14 th after the batile, feized on Mostebaldo in the rear of the pofition at Corona, to which part of the Aufrians retieated, while Joubent on the following morning attacked them in front. Being thas lurrounded, they were thrown into confinion, 6000 of them were taken priboners, and numbers $p$ erifhed in attempting to crob the Adige.

Duning this blvody contict on the upper part of this iver, Generai Moovara forced his pallage acsols the loner part of it near Porto Legnago, and obliged the repulican gemeal Guicux to retreat to Ronco. As Provera was marching rapidly to Mantua, Gueral An- abender sce cou came up with his rear, and made 2000 prionin; wut the Antrian general reached the neighi ourbood of that city on the $1 ;$ th, which was blochaded at St George and La Favourte. He fummoned the repubhean commander hare to furnender, but he having refuled to comply, lrovera endeawned, without fuccefi, to earry it by aftizult. He nest made an attack upon La Favourite, and was leconded by Wumter with the troops in the ganifun, who had perceived bis anival ; but as Bonajoste had arrived with remiorcement, General Wurmfer was defeated, and Provera being furrounded by the French, furrendered himfelt and lins troops as prifoners of war. In conlequence of thete engagements at Rivoli and Mantua, the Aufitans loit 23,000 men taken prifoners, and 60 pieces of camon. The furrender of Mantua was now inevitable, on account of abfolute famine, and theretore it capitulated on the 2 d of February. That Bomaparte might allow the French emigrants to eicape, he allowed General Wurmfer to felect and take out of the garriton 700 men who were not to be examined, nor viewed as prifoners of war, and the general himelf was to depait unconditionally.

The mont active and vigorous preparations were mak-位 by pope's ing by the emperor and the French, for recommencing torces iubtheir bioody contell on the German fronticrs, and there-dued. fore it was of importance for Buraparte to leave Italy in his rear in a date of tranguillity. He lent General Victor on the ift of February, tugether with the Lombard legion, to enter the papal territonies; and aiter the fusender of Mantua, General Bonaparte followed in perfon. The Lombard legion, atter itorming the entrenchments of the pope's troops, made 1000 of them prifoners, and took all their cannon. General Colli had carried away molt of the treature from the chapel at Loretto; but the republicans thll found articles of gold and dilier woith a million of lisres, and the image of the virgin was fent to lauis as a curiolity. At Iolentino the republican chict was net by a meilenger from the pepe with an overture of frate, and a treaty was conchuded on the $1 \mathrm{gth}^{\mathrm{h}}$. The pope promited to pay $15,000,000$ of livres, and to deliver 800 cavalry horles, with a like number of draught hories and oxen. He alfo agreed to pay $300,2: 0$ liveres to the family of the Frencle ambatidar Badevilk, whom the rablle had murdered at Kome, and to natake an apology by his miniller at Paris for that crent.
'The French having been to unfortunate in their in- Re entoree vation of Germany by the way of Swabia and Frith-ments fent ccria, now determined to make their principal at- to tonatempt from laty under the command of General Bona- parte. pate. Vaft bodics of thoops were theretore detached by the dircetury from thole who had inved under Moreau, and ient as fecretly as pulfible toward, laty by the way of Save. 'T he impending danger was however percoived by the court of Viema, and theretore gave the command on the sde of Italy to the archohe Charler, he being the only Autrian who had hitherto been faccelfifl againt the repablicans. The war was 1.0W about to be caried into new territories, where a

France, toe had fearecly ever been feen by the houfe of Aublris. It was neceflary that Bonaparte ihould once more force his way over the Alps, that immenfe chain of mountains which rifes in the neighbourhood of Toulon, and Itretching northward, obtains the names of Piedmont and Savoy. It then takes an eaiterly direction, forming the countrics of Switzerland, Tyrol, Carinthia, and Carniola. The three lat of thete palliner along the Adriatic, conflitute the frontier, in this quater, of the hereditary ftates of Aultria. The fertile and level comntry, which belonged to Venice, lies between the mountains and the fea. It is crofled by many ftreams which are increafed by the melting fnows of the $\lambda_{p}$ p, and whole peculiar characteritic is this, that they are greatelt in Bonsparte tories of the pope, the arrangement of the Aultrian army. army was going forward along the eaftern bank of the Piava. The republicans were on the oppolite fide, and Bonaparte, after quitting the papal territonies, hatened to join them. Having effected the paflige of the Piava on the 12 th of March, the Auilrians retired, flirmilhing for fome days, till they croffed the Taghianiento, where they halted with their whole force. The republican army reached, on the $17^{\text {th }}$, Valveclone, on the oppoite fide of the river, which after fome hefitation they determined to crofs. The ffream having been dimininised by the froft, the French croffed it in columns at different points. Joubert with the left wing recceived orders to pafs along the valley of the river Drave, beyond the higlieft chain of the Noric $d$ phs. Maficna at the head of the centre divifion, paffed into the defiles of thefe mountains, and the right divifion, commanded by Bonaparte, marched along the coaft of the Adriatic. Lifonzo, furrendered to the right wing of the army; and its garrifon, confiting of 3000 men, were made prifoners. The fame divifion entered Goritz on the 21it, where it found the principal magazines and bofpitals belonging to the Auftrians. Trieite was taken on the 23 d, and materials worth $2,000,000$ of livees were fent off by the French from the quickifler mines of Ydria. On the $24^{\text {th }}$ a large body of Auttiams was confined by Mafena, and a part of the right wint conmanded by General Guieux; but they hat ing procured reinforienentis fron the archduke, ensared the French nest diy, and were defeated, having loit 5002 prifoners and too baggage waggons. Equall fuccur attended the left wing under Joubert, Baraguay, D' Hilliers, and Delmas. Four thourad Autrians were taken on the banks of the Lavi, and they were detect:ed at Clauzen, with the lof of 1500 miffoners. This divifion then wirceted it, marcla emluard, alone the valley of the Drave tovards Clagenfurt, the metroperis of Carinuthia, where it was met by Gencral $M t$ nena, that oficer having ot liged the ardaldee to evirutac hi, leeachyaurters, and profecal nearer to the cury ital of the empire, which whe be jan to be in dan it. Franee tween the hontile armies wear the Lahn, in which the Autians lot $4=00$ taken prifoners. General Moreau hiving torced the paffage of the Upper R hine near Stralburg, attacked and carried the village of Diertheim. Next day the contlict was renewed with fuch vigour on the part of the republicans, that the fort of Kehl was taken, and 5000 Auftrians were made prifoners. They were next purfued towards the Danube, when all military operations were inftantly fufpended by meffengers difpatched through Germany from the archduke and Bonaparte, with the joyful news that peace was concluded. On the arrival of thefe meffensers, the army of General Hoche was making a defperate attack unon Francfort on the Maine, which General Warnecht was employing every effort to protect. Both armies fuddenly received the news, the holtile troops threw down their arms, and congratulated each other on the happy event.

A conteft of an alarming nature was now faft approaching between the legilative and executive branches of the French government. A third part of the leginlative body was now to be changed. On the 19th of May, Letourneur went out of the directory by lot ; on the 20th the new third took their feats, and on the 211 ft Barthelemy was chofen a member of the dircetory in the room of Letourneur. Pichegru, Jourdan and Willot, were among the members of the new third, fo that a decided majority of both councils was of the moderate farty ; and two members of the directory, Carnot and Barthelemy, were underlood to be men of the fame defcription. Every meafure was adopied which tended to rezder the Mountain party odious, or embarrafs the direfory.

Gilbert Defmolieres, on the $14^{\text {th }}$ of June, brought up a report from a committee on the fate of the finances, in which he inveighed againt the prodigality and profution of the directory and its agents in the frongeft language. A new plan of finance was propofed by the farre committee on the 18 th, which went to take from the directory the adminillation of the public money. Un the preceding day Camille Jourdan prefented a report of gracat length on the fubject of religion, wherein t.e itiffted on the impropriety of forbidding its ceremories to be publicly difplayed, and the iniquitous nature 1t that perfecution which its miniftershad fuffered, besavfe they could not take the oaths prefcribed by the legilature. The council of five hundred decreed, on the 15 th of July, that all the laws againft refractory prietts thould be repealed; and on the following day a cecree requiring from them an oath of fidelity to the c. :.thtution, was carried by a majority of no more than nemers members. Einery, a new member, propofed the refun cal of thofe laws which the property of emigrants the puitas.

$$

The :oya!1ts Cime frefh co.1-
 had teen conifcated, and that their relations fhould be convidered as comvetent to fucceed them. Such as had fled into foreign courcries from Toulon and other parts ef the nation, iectived encouragement to return home, and allowed to cherifh the expectation that their namos would be expunged from the lill of emigrants.
The difcuffion which thefe topirs underwent made the dieetory and the councils profented encmies to each other. The latter withed the fumer to be changed before the expiration of the legal time, and the directory uilied to d. pr e many nev members of their feats who had ueca elected by the peopte, As Barras rias sathes
the mon odious member of the directory, an ffort was Fiance. made to deprive him of his feat, under the pretence that he was le"s than the legal age of 40 ; but his colleagues maintained that he was born in the year 1755, and it feems no proof of the contraty could be produced. Still the directory did not want a number of adherent:. The refolution of the councils in favour of the pient had the appearance of a counter-revolution, which indticed the royalilts to refume courage, and journals were rapidly publithed in defence of their cauf. The councils receised intormation on the 2 th of July, that a divifion of the army under General Hoche was within a few leagues of Paris, while the conftitution declared that the directory incurred the penalty of ten years imprifonment, it it brought any troops nearer the refidence of the legilative body than twelve leagues wit..out itconlent. An explanation was demanded, when the di. rectory declared their ignorance of the march, having been undertaken without any orders from them, and purely owing to a mistake of the officer by whom it was conducted; but the councils paid little regard to fuch an allegation. The mutinous fuburb of St Antoine adhered to the majority of the directory, which encouraged them fo much, that they lof no time in proceeding to action. General Angereau had been fent for from Italy, under the pretest of delivering to the directory fome ftandards taken from the enemy. The Thuilleries was furrounded by Angereau on the morning of the $4^{t h}$, with a divition of the troops, when the guard of the councils refufed to act againtt them, and Ramel their commander was made prifoner. On entering the hall, he found Pichegru and twelve more of the chiefs of the oppofite faction, whom he immed:ately fent priloners to the temple. Carnot made his efcape on the preceding evening, but Barthelemy remained and was put under arreft. When feveral members of the councils came to the hall at the ufual hour, they were aitomihed to find that feals had been put upon the doors, and that they could not find admittance. They were ordered to go to the furgeon's hall, where the directory, it was faid, had appointed them to meet. Of both ccuncils not more than 120 members aflembled, who ient to obtain from the directory an account of the late proceedings. They were given to underftend that what had been done was ablolutely neceffary for the falvation of the republic, congratulating the duped councils on their e/cape from the machinations of the royalifts. According to the report of Boullay de la Meurth, a valt rovalitt confpiracy, the centre of which was in the boom of the councils, was cideavouring to fubvert the conilitution, but that the indefatigable diligence and activity of the directory bad defeated all their attempts! It was propofed to tranfport the confpirators without a trial, and the councils were fo completely impofed upon as to vote the tranfortation of 53 of their own nembers, and twelve other pertons, among which number were included the dircctors Carnot and Barthelemy.

During the whole of thefe tranfactions the city of Paris remained in a thate of tranquillity. Its unfortunate Aruggle on the $5^{\text {th }}$ of Otober had fo conpletcly fubdued the andour of the inhalitants, that they aliosed the national reprefentation to be wolated with impunity, and libenty to be tr.mpled under foot, withont a fingle cxertion in its defence, the directory ev-

Trance. cued the comatat to nation whe prow e ef the was laid, had onfered to join the ensigrants under the prince of Conde, and the duttinn commaded hy General Wurmler, and with this agorego eco fore to march directly to Pars, for the re-ctablilhment of royaliy. There are cortain circmmtances whith lead us to fufpect that this was a fabricntion: for at the time when this fuppofed correfpondence becane public, it was denied to be genuine; and Moreau who was implicated in this confpiracy, was after this employed in the fervice of the republic, to whofe military $\mathfrak{k i l l}$ and fidelity the French rulers feemed willing to commit the falvation of the country.

The directory was now very powerful, but its members foon became giddy from the elevated nature of their fituation, and feemed to act under the dangerous conviction, that there was nothing in which they might not venture to engage, whatever might be the rapacity or ambition attached to it. While contending with the councils, they prolonged the negotiations with Lord Malmelbury, acting in a fimilar manner refpecting thofe which had been entered into between Bonaparte and the imperial ambaffadors at Campo Formio. Great Britain offered to make peace with France, if permitted to retain pofleffion of the C ppe of Good Hope, together with the Spanith ifland of Trinidad. The negotiations with the emperor were fpeedily terminated, and on the r 7 th of October a definitive treaty was figned at Campo Formio. The Netherlands were given up to the republic, the Milanefe to the Cifalpine republic, and his territories in the Brifgaw to the duke of Modena, to compenfate for the lofs of his duchy in Italy. It was likewife agreed by the emperor that the French thould poffefs the Venetian iflands in the Levant, namely, Corfu, Zante, Cephalonia, Santa Maura, Cerigo and others. The emperor was to have the city of Venice with its remaining territory, from the extremity of Dalmatia, ts far as the Adige and the lake Garda. The Auitrians accordingly left the R hine, by which means the republicans were enabled to furround Mentz and Ehrenbreitlein, the former of which was captured in a fhort time, but the latter required a very tedious blockade before it would furrender. Venice was at the fame time entered by the Auftrians, the French having left it, and Bonaparte, when about to march out of Italy, left 25,000 men to garrifon Mantua, Brefcia, Milan, and fome other places, and to preferve this new republic in a flate of dependence upon France.
a body of It is faid that the directory about this time endeatroops land in Wales. voured to force America to purchale a forbearance from war by a large fum of money together with a private prefent of $50,=001$. to the members of the direc- tory. The lalt part of this charge was denied by the minifter Talleyrand, but the general impreftion it produced could not be effaced, and the directory was thus very much injured in the eftimation of fuch countries at were otherwife dipofed to view it in a very favourable light. To leffen its reputation flill more, it caufed the councils to pafs two laws, by which all neutral hips on their way to Britain or returning from it, thould be liable to be feized. The'e, however, produred an effect very different from that which wa, iniended ; for having put all the trade of the weltern world into the sower of the Britit, they enriched the very peopie

 Pu acath lect lay blughaded in thicir owa port, during the greater gart of the sear. The cuedition againt Ircland having comple. ly fathed, the directory was at a lof how to difofe of the gatley dlave who had made a pirt of Hoche's amy deftined againf lreland. It would have been cruel to remand them back to puniti. ment ; the troops would not ferve with them io the army, and by the now laws of France they conld not re. ceive a pardon, ncither was it prudent to give fo many criminals hberty. Thus perplexed, the directory at lafl determined to fend them over to England. They were landed from two figates and fome fimall vellels on the coait of Wales, with mukets and ammunition, but deftitute of artillery. On the evening of the day on which they landed ( 23 d of February), they were made prifoners of war by a party of militia, yeormanry, cavalry, colliers and others, under the command of Lord Catwor.

Although the nary of France continued in port, and Defert or therefore out of danger for the remainder of this year, a Frent h yet the Dutch and Spanith allies of that country fuitain, fleet by je:ed very ferious loffes by fea. A Spanilh tleet of 27 fail vis. of the line, oppofed to a Britih fleet of only 15 fail, under the gallant admiral Sir John Jervis, was completely defeated on the 14th of February, off Cape St Vincent. The Britich admiral paffed twice through the enemy's line, and cut off part of their theet from the rett. Four thips were taken, and the admiral's own thip made her efcape with confiderable difficulty. This Heet was on its way to Brell in order to effect a junction with the French Heet, but Jervis', victory rendered this object unattainable. In confequence of this memorable victory, Sir John was created earl St Vincent, and had an annuity of 22001 . fettled upon him, receiving at the fame time the thanks of both heufes of parliament.

The Dutch, if poffible, were fill more unfortunate, A Dut Admiral Duncan having blocked up the Texdl where theet detheir Heet lay, during the whole fummer, with the al featelty fitance of which it appears that the French meant to Dun an f. try the fate of another attack upon lreland. A refolu-Campe:tion having at length been adopted of riking an en- dow:. gagement with the Britih at fea, De Winter received politive orders to fail, a dep againf which he remonilrated, but without cffect. Almiral Duncan was at this time refitting at Yarmouth, but on receiving intelligence of the failing of the Dutch tieet, he fet out in fearch of, and came up with it on the ith of O tober, confliting of a force rather inferior to his own Aleet, which amounted to 16 tail of the line and three frigates. The Britilh admiral ran his tleet immediately through the Dutch line, commencing the attack $1=-$ tween them and their own coalt, about nine tales from Camperdown. As the Dutch are defperate fighters by fea, our readers will maturally conclule that this was a Canguinary contlict. It latied for three hours, at which time the greater part of the Dutch fiect had Itruck; but owing to the thallownefs of the "ater on the coat they could not all be feized. Light hips of the line, two of 66 and one of +4 guns were taken, heside a filsate aftermards lotl near the coaft of Britain. Admiral De. Winter was captured with his thip, and $\mathrm{Y}_{2}$

$\because$ Aume. nours fimilar to thofe which were beltowed upon Earl S: Vincent, and an amuity to the fame amount.

After the ratification of the treaty with the emperor at Campo Formio, Jofeph Bonaparte, one of the brothers of the genersl, was fent to the city of Rome as Flempotentiary from the French republic. The pope having now no expectation of foreign affitance, fubmiited to every demand for the reduction of his troops, and for emancipating every perfon confined in priforn on arcount of their political fentiments. On the 26th of D. cember 1797, three men waited upon the ambaffador, and requetted the co-operation of France in bringing about a revolution which a party at Rome was anxiows t.) effablig. He rejected the propolal, and did every thing in his power to diffuade them from it ; but he neglected to communicate the intelligence to the papal government, which was certainly his duty. He went to the fecretary of tlate on the 28 th, and thewed him a tilt of perions under his protection who had a legal authority to wear the French cockade, and confented at the fame time that all others wearing it fhould be punifhed. He offered to give up fix of the infurgents who had taken refuge in the palace. In the evening of the : 8 th a more ferious tumult happened in the courts and vicinity of the French ambaffador's palace, with which whe pope, it is believed, was not perfonally acquainted; but the governor of the city endeavoured to difperfe the infugents by parties of cavalry and infantry. General Duphot, in attempting to make the military deffit from firing upon the infurgents, was thot by a petty officer belonging to the troops of his holinefs. The ambaflador and his other friends now made their efcape to the palace through a bye-way. The Spanith ambaffador having been informed of this event, fent to the fecretary of ftate, and protefted againft fuch a daring violation of the privileges of plenipotentiaries. The palace of the French ambaifador was ftill furrounded by the military, when at lalt he demanded palfports to enable him to leave the territories of the pope, which were foon granted, and accompanied by many proteftations of the innocence of government, and its forrow that fuch an
$4^{8}:$
The cuntnental Power de. - line : mith ang the ': pe. unfortunate event fhould have taken place.
Jofeph Bonaparte went to Florence and from thence to Paris. The protection of Vienna, Spain, Naples, and Tufcany was earneftly folicited by the pope, but they all feemed difpoled to keep at a dittance from his misfortunes. General Bertbier experienced little or no oppofition on his march to Rome, where he fubverted the dominion of the pope, and proclamed the fovereignty of the Roman people, with too many marks of wanton, unprovoked infult. The tree of liberty was planted on the very day on which the annivertary of the pope's eleqtion to the fovereignty was celebrated; intended, no doubt, to make him feel till greater mortilication. While in the Silline chapel receiving the congratulations of the cardinals, the commithoner geperal, and Cervoni, who commanded the troops within the city, during this ceremony entered the chapel, and announced to the fovereign pontiff on his throne, that his reign was at an end. He was remoed to the territury of 'Tufany, where he dwelt in great olfcurity, till his enemies being in their turn driven from Ronie, w.ere pleafed to remove him farther from t!e capital, to terminate tis exifence beyond the A1ps,

The greatelt curiofities found in Rume ware con- Fiane. veyed to Paris, and fold by public auction, the directory having facrificed national vanity at the theine 1798. of avarice. Pafsports were offered to the natives of countries at war with France, if they inclined to become purchafers.

But fcenes of a different and fanguinary nature were $\mathrm{C}_{4} 86$ in the mean time exhibited in Switzerland, a country Swituef of which had preferved its neutrality during the contict of and reFrance with the combined powers, thus defending the inv th on weakeft part of her frontiers, and as a grateful return Frinch. for paft favours, it was now determined to fubjugate Switzerland. About the end of the year 179\%, an infurrection broke out in the Pays de Vaud, fubject to the canton of Berne, which made the government perceive its critical fituation, and ilfue a proclamation on the 5 th of lanuary 1798, requiring the peonle of the Pays de Vaud to appear in arms, renew their oath of allegiance, and reform every exifting abufe. A commifion of the fenate at Berne was empowered to examine every complaint, and redrefs every grievance; but their motions were confidered as too tardy by popular impatience, and the infurgents endeavoured to become matters of the ftrong places. Troops were fent againft them by the government of Berne, but General Weifs acted with hefitation, if not even with treachery, and a body of republicans appeared under General Me nard, who fent an aid de camp and two hulfars to General Weifs. As the meffengers returned, one of the huffars was killed, moft probably by accident, but it was inftantly magnified into a horrid breach of the law of nations. The French, therefore, continued to advance, and were mafters of the whole Pays de Vaud by the end of January. The government of Berne prepared for war, while it at the fame time ufed every effort in order to maintain peace. A truce was entered into with General Brune, the fuccefior of Menard, and thofe who killed the huffar were delivered up. An army of 20,000 men was collected, the command of which was given to M. d'Erlach, once a field marihal in the fervice of France. But there was a prevailing difaffection in his army, and the people were far from being united among themfelves. With this circumftance the French were well acquainted, and therefore they demanded a total change of government. As M. d'Erlach was apprehenfive of a ftill greater defection in his army, he requefted permiffion to put an end to the armiftice. The French now refufed to negotiate, and General Schawenberg on the 2d of March took poffeffion of Soleure at the head of 13,000 men. Brune afterwards made himfelf mafter of Friburg, and forced the Swils army to retreat. The government of Berne being now greatly alarmed, decreed the landflurm, or rifing of the people in a mafs, which their ancient cuiftoms juftified in the time of necellity. The people affe:mbled, diffolved the government, and offered to difmifs the army, if the republican troops would retire. This offer was rejected, without admitting a French garrion into Beme, and therefore they continued to advance. About 6000 from the army of M. d'Erlach had deferted, leaving him at the head of no more than 14,000 men; and although the riing had abundantly fupplied him with numbers, yet he had not time futhcient to get them properly arranged. He was attached ot the sho of Marh, and driven from Newenbeg and

Eavenbrin.

Fitace. Favenbrun, but haring rallied his troors, he make a fatend for fome time at Uteren. The contlict wis renewed at Grouholtz, fiom whence they were driven tour miles nearer the capital. Being compliely defeated, they murdered many of their officets in a fit of defpair, among whom w., their commander in chice. Berne capitulated to the French, which induced the nore wealthy and populous tates to follow the example; but the poorer cantons made a dreadful effiort to preferee their imall poneflions, and the independence of their country. They conpelled Schawenberg to retire with the lofs of 3000 men, but were at lait totally vanquithed by the fuperior ikill and numbers of the republican army. The public magazines were plundered, and a new confitution was forced upon them after the model of France.

If the directory made no fcruple to violate the independence of other nations, it was very reafonable to conclude that they would pay little regard to the liberties of their countrymen at home. A third of the legillature was clanged in the month of April ; one member of the direatory went out by ballot, and Treilhard was chofen to fucceed him. Nothing was left unattempted by the direetory to influence the clection in tavour of their friends, but their fuccels was not great. They complained to the council of five hundred on the 2d of May; they complaned of ploss of roydits, by which it was faid that elections had been made to full on men who were inimical to the interelt of the repubIic. It was propofed on the -th by the committee who reported on the mefiage of the direatory, that many electoral afiemblits thould be aunulled ; but Genera? Jourdan oppofed this plan as incompatible with the freedom of election, and as proceeding upon the fuppofition of confpiracies which had no exiftence.

We are now to be prefented with the moit extravagant project which perhaps the directory ever attempted to execute ;-to fend a formidable army to take poifetfion of Egypt, and from thence to proceed by the Red fea to the Eart Indies, to take poffefion of the Brition fettlements in that quarter of the globe. After peace was proclaimed between France and Germany, the directory made rofecret of their determination to invade Great Britain. Whether this project was of Bonaparte's own deviing, or intended as a hare in order to get rid of him and his victorious army, feems to be a matter which our readers mult be left to determine for themfelves. It might not be his project, and he might accept the command of the army of Egypt from this conviction, that he would be fafer abroad in the moft perilous undertaking, than be expofed at home to the malice of a govemment become jealous of his reputation, and which was far from being fcrupulous of its conduat.

The meditated attack upon Egypt was cert.inly cundueted with fuch a degree of fecrecy as wa, calculated to milead. Prodigious itories were circulated cor.ctriing large rafis of timber, by means of which the armif $f$ England, as it was called, was to be eonveyed over to Bricain ; and to give the greater probability to this report, General Bosaparte, the commenderinchint, made a journey to the weftern coant. The fitet was geting reidy in the haricur of Toulon, and treop - were colitite ed in its vicinity. But Bonaparte embarkul :.ith $4=, 0=0$ Dibis ertaran twapg, and on the gth of Juac realeithe
ithond Mata. He ,urrelled with the ramblmiper, Tian
 all at once in tas purt. The Freach commanter land. 17y ad his thopr ia dafient phate, wad attempted to make himedimater of tice illand. I i faid that maty of the huight, belonged to the illuminati, and :ere therefore ready to betray their government, Aike : wery feebie onpoftion the grand mafter cap tuated, wh thus nove up in a few days a forterefs which, it is fid, might have held out for wech, agsinit ath the troops of the Trench republic. Bonaparte left in the illand a garifo: of +000 men, and failed for Aleandria on the zut.

Rear-admiral Nelion having distinguithed himelf in + daws a very eminent degree, whik in the ftation of commo- Neila goe: dore under Lord St Vincent, was lent in purfuit of Bo in 1 arach naparte. Beinf wholly ignorant of the dellination of Rensthe French, he failed for Naples, where he obtained information of the attack upon Malta, to which accordi::gly he theered his courfe. On his arrival, however, he found that Bonaparte was gone; but conjecturing that he had failed for Alexandria, be immediately prepared to follow him. The French commander, inftead of keeping a direct courle towards that city, flood along the Grecian coant, till he made the eaternmot poial of the iland of Candia. Then Afering to the fouthoard, be To protracted his vorage, that he did not reach the E. g.ptian coatt till Admiral Nelfon lad left it. Having landed his troups, he took the city of Alexandria by itorn on the 3 th of july. It was defiperately defended by the inhabitants, but withoat military finl. The :\%publican tranforts wete drawn up withia the iance harbour of Alexandria, and the hips of war eat anch $t$ along the thore of the bay of A bouki. the roubli. c?n army marched on towards the Nile, and 't. proceeding along the barks of that river, they fuffered much from the intenfe heat of the climate. They foor cance to action with the Namecuke, or military ruler, of the country; but the imall dugree of till polelitd By thofe barbarians, was by no means a match for Eluropean tactics. Cairo furcendered on the 23 d , and two daws after, another battle was fought, in which the inhabitants were defeated. They made a lak effort on the 26 th, near the cuibbrated pyramids, when 2000 of them were killed, 400 camels with baggage were taticn, and 50 pieces of camon.

Havirg proceeded thus far in his conqueft of Egyp: Thing Bonaparte framed for it a provifional government, and wil dup: ifined proclamatious in the Arabian language, protect- (in) of ble ing that the French were friendly to the religion of Mahomet, owned the authority of the grand fignior, and were only cone to ialict punifhment on the Namelukes for doing fo much injury to their trade with Egypt. Thus far the good fortune of Bonaparte feemed itill to attend him; hut on the it of Augurt the tleet under Admira! Nellon appeared of the month of the Nile, who hasing difcovered the pofition of the French flee:, prepared to attack it. In point of numbers the tho deets nere upen a level, bat as to weight of metal the French fleet was the flronger of the two. Admiral Nelim, by rumning forme of his thips between the encmy and the land, fursounded one part of the lest, while the relf were thes rendered entirely uiclefs. Th.s Call dein ran aground while this plan was carrying into Thict; an adrantage upon the whole, as it pointad out - .2. .it where the danger bive concoled. This mic-
marathe ation commenced with the fetting of the fun, and contineed, with occafional intervals, till the break of dy. Nine fiil of the line belonging to the French were tahen; a llip of the line was burnt by her oorn commander, and the admiral's flag hip, L'Orieat, was blow up during the action, few of her crew, comilting of 1000 men, having efcaped deifruation. Two dips of the line and two frigates were faved by tlight, but afiervards captured.

If we confine ourfelves to modern times, it will be difficult to point out any naval engagement productive of more interelting effects than this. The military exritions of France had by degrees deftroyed the combiration which the princes of Europe formed againit ber. The victorics of Bonaparte had humbled the pride of Sultiaa; the continent looked with difmay towards the new republic, and when the directory feized on Rome and Switzerland, no power ventured to interpofe in their behalf. The afpect of affairs, however, had now undergone an almoft total revolution. The once triumthant Bonaparte was hut up in a barbarous country, from which the fleets of Britain might preyent his return. Propofals were made by Great Britain to the northern powers, for the recommencement of hoftilities againt France, as it was not conceived poffible that the could make fuch refiftance as formerly. The ftates of Italy, to, determined to make a bold effort for the rerovery of their independence. The court of Naples rejoiced at the defruction of the French fleet, and the king himfelf went to meet Admiral Nelfon o: his return from the Nile.

It is well known that the French had long promifed encouragement to the Irilh rebels; but as their expectations were not gratified in time, they broke out into open rebellion without the promifed afliftance; and when the fpirit of rebellion was almoil wholly fubdued, the directory attempted to land troops in fmall divifions, fuch as that under General Humbert on the 22d of Auyuft, confifting only of 1100 men , who landed at Killala. Yet this force, fmall as it war, would have proved formidable bat a month before. They were joined by a party of the moft defperate of the rebels in the sicinity, and defeated General Lake at the head of a fuperior force, taking from him fix pieces of cannon. Their next ftep was to march in different directions to announce the arrival of the republicans, and maintained their ground for three weeks. This able general receiving no reinforcements from France, finding the rebellion in a great meafure cruthed, and being informed that General Cornwallis was about to furround him with 25,000 men, he laid down his arms to a Britiih column, four days after he had difmiffed his Iribh affociates, that they might provide for their own fafety. Active meafures were now taken by the diredory to tend troops to Ireland when too late, as the vigilance of Britih cruizers defeated all their endeavours. La Hoche, a fhip of $8_{+}$guns, and four frigates, were captured by Sir John Borlafe Warren on the 12 th of October, in attempting to reach Ireland with 3000 men. On the 20th another frigate was tak cn , deffined for the fame country, which induced the directory to abandon the attempt as altogether defperate.

The victory obtained by Admiral Nelfon at the conduct of mouth of the Nile, made the king of Naples act the the king of very imprudent part of preparing to commence hoftiliNaples.
ties againd $\Gamma$ rance. Without even waiting thl tiee
Auftrians thould conmence the attack on the reputliAuftrans inoum conmence the attack on the republi-
can troops in the Romaan territory, he procured General Mack to aflume the command of his army. He began the war without any foreign aid, except the Britih flect, and thus brought upon himfelf the vengeance of the French republic. The dircetory had no idea that he would adopt fuch conduct, and of confequence when General Mack appeared at the head of $+5,000 \mathrm{mcn}$, the troops of France in that quarter were unable to coutend with him. Geareal Championet having juftly complained of the attack made upon his poits, circumAtanced as he was, he received for anfiser from the hofitle comanander, that his maje? y had refolved to take poffeffion of the Roman territory, and advifed the French to retirc quietly into the Cifalpine flates, maintaining that their entrance into Tufcany would be confidered as a declaration of war. Championet accordingly evacuated Rome, as he had no force againft fuch a formidable amm. He left a garrifon in the catlle of St Angelo, and concentrated what troops he could collect in the northern parts of the Roman fiate. General Mack entered the city of Rome without oppofition in the end of Noverrber.

Thefe tranfactions having been known at Paris, war The Fren was immediately declared againft their Neapolitan and declare war Sardinian majefties, the latter of whom had committed againft Nano act of hoifility againf the French; but he was ac- Slesdiniz. cufed of difaffection to the republic, a charge which could fcarcely fail to be true. He found himfelf placed in a very humiliating fituation fince the firf entrance of Bonaparte into Italy, his ftrongelt fortrefies being in poffeffion of the French, who levied on him what contributions they thought proper, and even placed a garrifon in his metropolis. Being unable to go to war, he made a voluntary furrender of his continental dominions, and agreed to retire to the illand of Sardinia.

A period was foon put to the difpute with Naples, As the French retreated, the country people gave them much trouble and uneafinefs, and the Neapolitan troops; fcarcely obferved the modern rules of war refpecting fuch as they had taken prifoners. When General Bouchard, by orders from General Mack, commanded the caftle of St Angelo to furrender, he maintained that he wonld view the prifoners in the light of hoftages for the conduct of the garrifon, and that a man thould be put to death for every gun fired from the cafte. It ${ }^{\bullet}$ is fcarcely to be imagined that the Neapoiitan officers would have exprefled themfelves in fuch a thocking manner, if they had not calculated on the vigorous cooperation of the Auftrian forces, in which, however, they were vely much deceived. The confequence was, that the territory of Naples very foon fell into the hands of the Freich. Either the terror of the republican name was fo great in Italy, or the cowardice of the Neapolitan troops, that they were defeated by onefurth of their own numbers, at Terni, Porto Fermo, Civita Caltellana, Otriculi, and Calvi. As the army of General Mack was gradually reduced to 12,000 men, in confequence of defertion and frequent defeats, he advifed the king of Naples and his faraly to take refuge on board the Britih tleet, which was then lying at Leghorn. This advice was adopted, and they reached $\mathrm{Pa}^{\prime}$ ermo in Sicily on the 27 h of December, in Admiral Nelfon's thip. General Mack having requetted an armiltice.

## F R A

France. miatice, it was refufed by the French commander. Being driven from Capua, the only remaining poft of any confe uence in the territory of Vuples, and being in the greatert danger from the ditaffection of his troops, he furrendered himfelt and the othicers of his tiaff to the sepublican general. The governos of Naples offered a contelhution of money if the French trons would not enter that city, which was agreed to, and they remained at Carua. General Scrrurier, at the head of a French column, drove the Neapolitans out of Leghorn, and took poflethon of that place.

Such is the mildnefs of the climate in the fouthem parts of Italy, that the people can fubfit with fewer effiorts of induitry than in almolt any other country of Eurofe. This naturally begets an indulent difpofition, which is cherithed by a number of charitable inttitutions originating from the Catholic relicion. In Naples there had long been a body of men called Lazzaroni, or beggars, amounting to the altonithing fum total of near $40,2=0$, who entirely fubfited on charity. They frequently threatened the tate if they did not receive an immediate fupply of their wanes, which procured them very liberal contributions. Having been informed that the French, wherever they came, dettroyed all monafteries and other fources of charity, they determined to oppole them to the utmoft of their power, and appear the advocates for royal government. In the begimning of January 1799, they exhibited marks of difcontent, and at latt broke out into an open infurrection. They appointed Prince Militorni their commander in chief, vho made many fruitlefs efforts to reftrain their violence and love of plunder. They declared war againit the French, forced the prifons open, ed murdered all who had been incarcerated for difaffection to the kingly govermment. Their ravages no:: became io dreadful and boundlels, that Prince Militomi abandoned them, fet out to Capua, and requelted Championet to take peffelfion of the city, in order to refcue it from utter deffruction. It was agreed that a column of French troops thould take a circuitous route, and enter the city from the oppofite quarter. Before this plan could be carried into execution, two-t iirds of the Lazzaroni marched out on the 1 gth and 2 zth of lanuary, with the daring refolution to attack the French in the fortificatiois of Capua. Naltitudes of them perithed by the French artiliery; and in order to f.wotur the capture of Naples by the party fent on that expedition, Championet made no fally out upon them, but continued on the defenfive. Ti.e Lazzarni being informed on the 21 it that a French column hed marched for Naples, returned to the civy; and although Championet clofely purfued them, they arrived in time to harricade the firceis, and prepare for the defonce of differe:t quarters. A terribie contlict now conmericed, which lafted from the mominer of $t$ lee $=2+$ to the evening of the 23d of Januars. Iaving tean diaizon from Atreet of itrect, they finally sallied at coe of the sates of the city, where they were alterat won? cut wh. It
 not to have been able to give a betier diacesion to the undanted courane of fuch meth.

We mav siew this triumph as the left which the di.
 duat vere n w rapitly gatherivg arour? thom. '1', +y were with the greatelt julice ungonhe at home, both
from their mode of conducting public affairs, and their repeated violations of the conilitution of their country. Their profution was unlimited, as well as the exorbitant demands which they made upon conquered countries. Championet was fo athamed of them, that in laly he endeavoured to retirain them, in conlequence of which he was deprived of his command, and thrown into prifon; Scherer, the war minilier, being appointed his fuccellior. Under him the rapacity of the government agents, and the embezzlement of the public thotes, were carried as high as pollible. Iet France ifill continued to be dreaded by foreign nations, to whom the true dtate of internal affairs was but obfcurely known. An army of 45,000 Ruffians had arrived to the allillance of Aultria, yet that cabinet was at a lofs whether to declare war or not. Britain folicited the aid of Pruffa with an offor of large fublidies; but Sieyes, the plenipotentiary at Berlin, artfully contrived to defeat the negotiation, and counteract the unpopularity of his country in Germany, by giving to the world the fecret convention of Canpo Formio. This determined the greater number of the German princes to maintain their neutrality under the guardiauhip of Prutio.

A note was prefented to the congrefs at Raftadt on the 2 d of January by the French plenipotentiaries refident there, intimating that if the entrance of Rutian troops into Germany was not prevented, it would be confidered as tantamount to a declaration of war. Io this no fativfactory anfwer was returned. The itrong fortrefs of Ehrenbreititein fürendered on the 25th of that month, after being blockaded fince the treaty of Campo Formio. This puffefion, tosether with Mentz and Dufieldorf, made the French a very powerful enemy on the Rhine. Switzerland altis belonged to them, and all the fortified places of It.ly, on which account they were qualified to commence attive operation. At this period Jourdan commanded on the Upper Rhine from Mentz to Huningen; the eatem frontier of Switzerland was occupied by Genral Mufena; Scherer had the chief command in Italy; Muteat aled under him , and Macdonald rommanded the twop, in the territory of Rome and Niples. Yet all the ee armies fo feattered, did not exceed $1,72,=00$ men, a force uremty inferior to that of Acitria, alto ether ind pendent of the Ruflim army. The directory, however, trutti:g to w... ile the unity of its own phan, the wavering politics of the eatw acourt of Vicum, and the flow movements of the im- c anot ror perial armies, wan anxions to reac: the war, a declara- "a for 1 tion of whel agrint the emperor of Germms :and the date of frand duke of lucany, wa, made on the 1 the of twasev. Mansh. Jourdan had actually crolied the Rhine at Straborgh on the int of that month, and occupied many frong positions in Subluia. Monheim was taken, and Cencri Bern dote fammoned Philpmbery to furrealer, white (ieneral it Cor emoted Surgari. Ir

 fena marched into the terrioury of the Gitions, itnd for-
 them prifoner, abe ther a their weeral and the
 wif the Gitions wa : alared.

## F R A

Franie. fortant polt of Feldkirch, which was held by General
Hotze. Defeated in his firit attempt, Mulfena renewed the attack five times with frefin forces, but the dstermined bravely of the Auftrians readered them ineffecturl. But as the French were in pollellion of the Grifons, the invafion of the Engadine was facilitated, where the Aufrians being too weak to refilt, retreated into the Tyrol, and were purlued by the republicans, who forced fome of the defiles, and extended their inroads as far as Glurentz and Nauders.

The vanguard of the principal Autrian army pufhed on to meet the French. It was attacked by Jourdan on the acth of March, by whom the outpoits were drisen in; but the centre of lis army was attacked on the following day, and forced to rettre to Stockach during the night. The archduke cncamped before Stockach on the 2.tth, and the republicans attacked him on the following day. His right wing under General Meerfeldt was their main object, which they fucceeded in driving into a wood between Liptingen and Stockach. Necrfeldt renewed the contlict without ruccefs. The left wing having maintained its ground, fint ieinforcements to General Meerfcldt, who in his turn obliged the French to retire. The French, fovever, made 4000 priloners during the varions movements of the day. Yet their lof was fo great, and thee dutrian force fo vaftly fuperior to their own, that Geneal Jourdan durft not hazard another engagement. He retreated on the following day, and feeling that he was not a match for the enemy, he fent a part of his army to cover Kehl and Strabburg, and marched with the remainder towards Switzerland. By this event General Maffena, who was forcing his way to the Tyrol and Engadine, was obliged to return to the protection of Switzerland. He was appointed to the chief command in this quarter, and Jourdan was remored.

The Aultrians were no lefs fucceffful in Italy, notwithftanding they were attacked by the French before the termination of the ammiltice. General Kray obtained a complete victory over them at Legnago, and forced them to thee for protection under the walls of Mantua. On the 15 th of April they were again attacked by the Auflians at Memiruolo, and again forced to retreat after an obilinate refftance. The lofs fultained by the French in thefe different engagements was unquellionably great, but we thould apprehend that the account which itates it at 32,000 mea in killed, wounded and priluners, mult furely be exaggerated. But the Auflrians may be faid to have purchaied thefe victorics at a dear rate. Scherer at firlt gained fome advantages over them, but he had not akill to improve them, clfe they would have unquefionably given a new turn to the afpeet of affairs. The Autrian poils were forced by a divition of his army on the 26th of Marel, and 4000 prifoners taken; but on the other divifion being repulfed, he withdrew his treops, and theus relinquiked the advantaces he lad obtained. On the sth of $A$ pril the divition under Moreau performed wotsere, and twok 3000 prifonets; but by the unfialful meaiures of Scherer, he was nut fupported, and the triumph of the Autrians was of curtie complete.

Prich to this jeriod, a boly of Rullans jined the imperains imperialits, and the command of this combined army trient un. Wav given to Field nintlal Sunatrow Kinnilki, who

after carrying the outpofts of General Moreau, Suwarrow determined to attack him in his entrenchments. He maintained the appearance of attack along the whole Ine of Moreau, while he fecretly threw a bridge over among the rocks at the upper part of the river, where fuch a thing had been conlidered as impoffible. By means of this bridge a part of the combined army next morning turned the republican fortifications, and attacked their flank and rear, while the reft of the army forced the pafiage of the river at different points. The French fought with their ufual intrepidity, but were foon driven from all their pofitions, and forced to retreat to Pavia, with the lofs of 6000 men killed, 5000 made prifoners, including four generals, and 80 pieces of cannon.

General Moreau now eftablifhed the poor remains of his army, amounting to 12,000 men, upon the Po, between Aleffandria and Valentia. He forced, on the it th of May, a body of Auftrians to retreat, and took a number of them prifoners. On the $\$ 2$ th, about 7000 Rufians croffed the Po at Bafignano, and marched on towards Pecetto, when Moreau fell upon them with fury; and they refufing to lay down their arms, about 2000 of them were drowned in repaffing the river, and a few were taken prifoners. On the advance of Su warrow, General MIoreau was under the neceffity of retiring to occupy the Bochetta, as well as other paffes which lead to the territory of Genoa, when the combined army began the fieges of the fortified places in Italy then occupied by the French. Bellegarde drove the French from the Engadine; Maffena was obliged to retire to the vicinity of Zurich, he was fo preffed by the archduke; and nearly the whole of Piedmont had rifen againit the republicans. They received no reinforcements from the interior of France, and their officers were obliged to act on the defenfive, to defend the frontiers as long as poffible. In one inftance only they had the power of making offenfive war, and it was certainly done with great vigour. General Macdonald had itill a confiderable army in the fouthern parts of Itals, in the territories of Naples and Rome. The combined powers had made no effort to cut off his retreat, convinced, perhaps that this could fcarcely be accomplifhed in the mountainous countries of Tufcany and Genoa. Knowing his fituation to be fecure, he was in no hurry to remove, although ncarly the whole country between him and France was occupied by the combined army. His army amounted to about 30,000 men, and he received orders from the directory to leave the territories of Rome and Naples, and unite, if polfible, with the army of Noreau. From the dituation of the allies, however, he refolved to hazard an action by himfelf. With Noreau he had concerted a plan for dividing their enemies, and vanquifhing them in detail, as Bonaparte had fo often done in Italy be ore. Macdonald alone was in a fituation for hriking an important blow, yct it was neceflary for Moreau to draw upon himfelf as many of the Aulro-Rufian forces as pofible, that the remainder might be more completely expofed to the attack of Macdonald.

Moreau asalled himelf of the circumbance of the Artulift Fronch and Spanih ile ts being in the vicinits of Genoa, t:gem of to foread a report that they had brought him a very ${ }^{\text {he }}$ roul powe ial senforcement, intending thereby to withiraw the atetaion of suwarrow frons Miactonald. The

 of his army．Hi matecelful attempt apun Acrent indeed appear importan，efpecially to Brian，if it b true that the Diufe，to die number of 62,000 math， had promifed to join him on the reduetion of that town． Had this junction bech effected，it is believed that Confiantinople would have become their prey，which． was fint to have been plundered，ind then reduced to athes．

While $F$ ：ance experienced iuth reve：fo abond，the was much difturbed allo by intern 1 commotions，and teny turs the directory found itfelf in a ray chitical lituntion，
 and thicy could no longer focuse a majonty in the council，they were funh into fich contempi．Wien they fought money，they obtained ref roaches on ac－ count of their own profuion，and the agents they em－ ployed．Infurrections in the wett and fouth were formed by the friends of royalty，and thefe were with diticulty fubdued，un account of the abfence of the military．In the midn of all thete difficulties，the occurrence of one event feemed to promile the direc－ tory the return of their former influence．On the $28+1$ ． of April，the Erench plenipotentianies rectived order； to quit Raladt in $2+$ hours．Hwing demanded a pafport from Colonel Barbatey，they received for an－ fwer that nowe could grant it but the commander in chief．They at lat began their journey，the thaee mi－ niter：，Bunsier，Roberjot，and Jean Debry，were in feparate carriages，Roberjot having his wite，and Jean Debry his wife and daughters along with him，attended ty the miniters of the Cifalpine republic．At a hort diftance from Ratiadt they were not by 50 ． 13 rim tr Frenct hufi．．rs，who itupped the carriage of Jean Detry，and $\mathrm{m}^{5}$ ．Tra－ demanded his name．Of this he intormed them，adding Ratait． that he was a French miniller returning to France．He wa immediately turn fiom his carriage，defperately wounded with labses，and thrown into a disch for dead．Bomier and Roberjot were murdered on the foot．When the rubian diparted，and the earisues retumed to Rafldit，Juan Dury watdered all nimht $i_{1}$ the sood，and next day returned to Ratadt．He demanded the reflitution of the pupers which the hired allafins had carried off when they plundered the c：ar－ riages，but they were refuled．Katialt and its vici－ nity was occupied by French truop during the long fitting of coagref，of which the Aurtians Irad ob－ tined poffenion but a few dass before．The diferline， therefore，of the Auttim any was feverely reprosened by thi erent；lut it is proballe that mur than the vant of fubordiation was at the buttom of a crime fo atiocious，unvecelented，and totally repugnant to the laws of nations．It is whe，the archuluke loit too time to declare lis，ettor igmorance of the matter in a letter t．Nemena；but this wats far from giving Gavertion to the Fanch beviuy．In a meninge to the councib on

## F R $A$

Irance the 5 th of $M$, they made it the premeditated at of the And dian cianment, to infult France by the muder of her amballadora.

A violent oppofition to the tirectory comnenced by the introduction of the now thind of this year. Siecye, who wat ambuflador at Berlin, and hal porificd con lifiderable inthence over all partion, wa eleted a member of the directury. This flation, we hate already fetn, he refured to occuny at the firit ehablemment of the confitution, and therefore lis acceptatace of it at frech a critical juncture, excited great dorprife. Treihand was removed from the dirceory, as it was fuid that he had hed an effee in the thate within leis than a year previous to his election. Morlios atd Revellere were under the neculiay of refigning, to avoid an impeachment which was the atenes to be brought agsint them; Fut Berras 1till retui:ed his fiation. Mrutin, Gohier, and Desos, fun who were but very little l.aonn, and, far from being leakes of the conteading parties, velt chofen newbers wit the directary. Tae public fpirit was attompted to be revired bi the ettathomern of chab, a liber'y of which the reithets Jacolims firit took adratage. 'In? fum propuid violut mealines, and Wero.t to den weee the menters and the conduct of
 atarmel the circetory, obtained perminion from the rouncils to farurels their mettinge, before they had
time to corrant the fublic min.l.

The direct ry $\quad$ ow employe 1 every effor: to aur, ment the armics whic: latd lately fisifoed tach dradtui dminutions. In the benitsing of Augut their amme in
 Jun en had the chinf commant. Thm, Alellandia, Milan, Pechiet, and Fearara, wete captured by the allics with atoniming rapidity. Turin futained a kumbardment of only three day , Alellanéri, hed out feven, aad Mantua on! fourticu, in which lati place there wre 12,000 who were dimitied on their parole. The combind jower, next laid herge to 'lortona, and Geneas I The'sert refolved on $i$, 1 clief, which olject he expected to acon:plith before the arrival of Kray with affifunce to Sunarrow. The whole of the Auftimen poils were driven in by the repuldicans on the $13^{\text {rh }}$ of Augult, who took polifition of Novi. On the isthe they were attacked by Susanow, who by this time had revived troups from Mintua under General Kay. The right wing was conmanded by this oficer, its icft by Melas, and its centre by Prince Procration and sumanow in perfon. The engagement commenced about five o'clock in the moming, foon after which, whic General Jubbert was u: , ing his troops forword to charge with the bayonet, le received a muket thot in his body, and falling from his horte, he imancuiately ex,ired. Moreau relamed the commend, and after a bloody conflict, lie alied amy gave way in all dinecti ns. The Rentions in paricular futiered feverely, from the cbitinate manner in which thoy fonght. The French line was attacked at three in the atomom, hut remaned unbroken; and the whole wowl have termirated in the defeat of the anies, if Genera: M las had not tarped the right Aank of the republican tine; and following up his advantages, he gnt poriction of Novi, when the French army began to retieat under the comman 1 of General Moreau.

The Aulrians fyy that the French upen the onc.inn
lof 4000 mon kilicd, and the fame number then prifonen, confoing that theis own lofs was equal to this; but the lots of the Rumians was never publinted. We have reafon to beliese that it was the greatelf of the whole, fince they will rather fand and be cut to pieces than think of retratias. The French loit all hope of being able to defend Cenoa, and theretore prepared to cvacuate that city and teritory. It was now the apprehenfion of the dirccoory that the fouth of France nou? inmediatcly be invadid, tut in this they were happily deceived. The conquesed army was attonibed to find itielf umoletted aftur folignal a deteat, and in a few days ventarel to lend back parties to secomnoitre the murvements of the allies. Championet, the fuccefor oi dwiert, was anazed to fad thi it they had rather retreated tl an adranced, on which account he refuned the poltions hed by his amy beforc the bathe of Novi.

So for from profecuting the ammantages they had ob-Sunarrore tained in inaly, Sunarrow was pertuaded to abandonmarthes to
 deliverance of Suitzerland from the yohe of France. SwitzerThe amy of Naliena in this quarter amolated to 7a,0co mun in the month of Aurult, which not only prevented the archduke from pmitung his adrantake. but the Frewch even threatened to enanger his foit tion. Mi ffenas right wing under General Lecourke hid conied Muont St Gothard, the srat pais icadins from the caltem farti of Swizetland into Ital. Si. warrow's expectations were io duatt his b, having never y: t been samquilhed, and being called upon to undert. $k$ ie an enterpric in which the Ambians had hitherio falted, eit: mader their molt fortunate gencral. When he wa, ready io marh, the Autrian conmander in Italy refued to give him mote, for trmionting bis bagkage. This cifeer had recure to a rout pitifal falichood, when the aforted that he viould te furnithed with a cempetent number at Bellinzone, where Suwarrow could find none. Heving no other alternative, he dimounted the caval:y, and made whe of their hereses to drag along the bagrage. In fipite of thele ubracles, however, lie atrived, by forced marches oft the frontiets of Sovizuchland on the day which he and the archacke had fined upon.

Either furpoling that it would demean a prince of the houle of Aufiria to ferve under a Rufian general, or not being daring enough to require the moll experienced general in Europe to receive orders from to young at man as the archduke, that prince was fent into Su nhia to bitack a lmall body of repul licans. He took whin lim 48,000 , lume fay $60,000 \mathrm{men}$, although 20,000 would have been more than futhicient for the accomplihunent of fuch an condertaking. It is not an caly matter to conceive upon what principle the council of war at Viemna could imaxine, that !uch an able otheer as Mafien would cundmue inative at the head of an army almoll the double of that which was lent to oppofe him. Tie atchdure marched ageinat the Fiench in Suabia, who relited him as much as the fimall number of their troops vould feamit; Lut they were gradually driven towards the Rhine. 'Po carry on the deception, they made a ferious fand in the vicinity of Manheim, where they lon 1820 men, and which the Aultians entered, fecmingly determined to crofs the Rhine.
s.troalud in the na: in tine was comphtely cxpoled

Tuid to the aray of Matiena．IVe is，he wing of the cembined army in this coun：y wis crommanded by Coneral Haze；the cent：e，compoled of the nevily ur－ rived Ruthars，was haded by Korlah of；and the leit $\cdots$ ly General Nuendotf．As foon as Matena un－ contoud that the archoluke had entered Manheim，and that Suwarrow was approaching to Suitzenlad by the way of St Guthard，he began his movements．so fo．．． t＇ird wa defended by Leccu：be，and in the man time Mafena determined to anticipate the arnival of Suwar－ rore．llaving drawn the attention of the K uffians to another quarter on the $2 i^{t h}$ of $S$ ptember，by a fatte attack，he fuddenly crofled the Limmat，three leagues from Zurich．Some of the French trons engage！the Auftrans，bot the peincipal part of the arm，marclied againt the RuTans．Gencral Hutze fell in the leegin－ niesg of the adion，and Petraich who tueceaded 1 im 1launed at total defeat，by retiring in the weht with the lofs of 4050 men．The Rulians fought with sery im－ gular obtinacy，teing in a mountinows country to which they were ftranges，and fighting agsinct the molt $a^{1}$ 准 commanders in Europe．It was in vain，however，$: 0$ attompt puting them to flight，for even when furrounded they would not lay down their arms，but tout to be Aughtered on the focit．The Autrians baving re－ treated on the $25^{t h}$ ，the Rufians on the 28 th followed thicir example，ietreatintr under General Korlakol in ：chd ocder，and with the lofs of 3000 men，which was not very great，comidering his perilous lituation．

During thete tranfations，General Suwarrow was proceeding by the way of Italy with an anmy of 18,000 ， but others fay no more than 15,000 men．He carried the jafs of St Gothard，and defcended into the valley of Urferen，driving Lecourbe before lim with great faughter，and advanced as f．r as Altoff．He next day reached the canton of Glaris，and made 1000 of the Fiench，rifoners，and General linken defeated another comps of 13 co men．M，feata now turned upoa hu－ warrow，and by furrounding lim on all fides，expected to take him and the grand duke Conit antine prifoners． Suwarrow detended himelf in a very matterly manner， and there beins only one pafs in the momntains moccu－ pied by the republicans，the aged hero difurered it，and by this he efficted his efeafe，but loft hiv camon and baggage among the dreadit precipices with which that country abounds．Fie mate his way through the Grilo． country，and arrived at Cuire with abut 6000 nien． Suwarow felt truly isdignont when he fornd i：what manner efftirs had been conducted，the perilous itua－ tion in which the Rumians had been left by the arch－ duhe，and the detaugtion which of confequence they had met with．He cowidured himfelf and hivmen is treacherouily betryed，complained bitterly of the commander of the alies in Switzerland，and 1 blicly Carging the council of Vema with leltantef and injuitice，relufed to cu－operate farther with the －duffian ams：y．He traminited an account of the whole in a letse：to Peterburgh，and withdew his Eorces to the vicinity of Auglburg to watt for forther vrders from hi court．
under A！mim！Inucm．
E． 1 weather fic：onted F． ary attempt ：o lat the twop，till the 27 th ，on the－ mr raing of which day the debartation was effecte？on $179 \%$ the thore of Heliter Point watloct oppolion．They were not expected to lard in North Hollanm，on which accomet the troops in that neiphbou－hon 1 vre tow． But before the Britith troops had proceeded far on their march，they had to contend with a contiderable bocty of iatantry，cavalry，and artillery，hatily collected irom the adiacent towns． 1 lie Dat hh tought with great uktincy，but berame fatigued by the Itealy orpolition of their antagoritt，and fell bark about two leagues． A ney evacuated the fort of Helder in the night，and it wa taken polithon of by the litith on the morning of the 2 sth．Adniral Mitchell now entered the Zuyder lea with a detachment of the Butifh flect，in ordcr to give battle 10 the Dutch under Admiral Story． Inttead of retiring to the fhallow water wit？which that lea abounds，he unaccountally furveldered his a hole theet on the 3 zth of Augut whout niving a gun，pretending that from the mutinous dipplition of his it men，he could not prevai upon them to fight．

If this had terninated the expedition，it wo $u^{\prime}$ d have which， 5 been evtremely fortunste as eftablinhing the porver of conducked． the Britith flect without a rival．But this victory，if it can be fo called，wa followed up by an endeavour to reitore the authority of the ftadtholder，and the ancient government of the United Provinces．Asnomore than the frat divifion had arrived，the terror of an invading foe began to be dillipated，the enemies of the rees yo－ vernment were diheartened，and time was allowed to prepare for defence．But thefe were not the only errors chargeable on the expedition．The Britiin troops landed in the very wort place they could poifibly have chofen，not only as it is everywhere interfected by ditches and canals，but it abounded more than any other part of Holland，with perfons difaffected to the perfon and government of the ttadtholder．In a word， this unfortunate eypedition wa，undertaken toward，the approach of the rainy feafon，when a campaign in Hol． land is next to impolible．When it was firt tpoken of，even the French directory hefitate 1 to undertake the defence of that country；but when the time and flace of landin，came to be known，they wert foon determined， being almont certain of luccefs．General Brane was accordingly fent with what troops could be lpeedily collected，in order to co－operate with General Daen． dals．

General Abercromby in the meantime conld only set on the defenfive，as no reinforcement had arrived． The enemy was encouraged by his want of activity， and ventmed to attack him on the $1-$ th of September． Two Dutch columns，and one of republicanc，advanced upon him，but were repulled in every direction，and forced to retreat to Alkmaer．Additional troops ar－ rived on the $13^{\text {th }}$ ，under his royal highnets the duke of Yoth，who athumed the chief command．On the arrival of the Rutlians，offenfive operations were im． mediately refulved on，and the army advanced on the 19th．The left wing under General Abercromby marched along the thore of the Zuyder fea to attack Hoorne；Generals Dundas and Pultney commanded the centre columns，and the Rullians were led on by their own geveral D＇H．rman．Owing to Come mifunder ftanding the Ruftans advanced to attack the enemy 2.

amy of $18,5=0$ Turks landed at Aboukir, whicin they carried $l_{y}$ arlult, and put the garrilon to death, confitins of 5 men. Bomapaste marched domn the county asamithem on tha $15^{\text {th }}$, and tes ditys after cone in light of them at is o'cluck in the norni. Their troops n ere disided into tro pats, cheamper. on tha ofperite felen of a dengetal plain. The cavaty of Bonapatte adranced with rapidity into the centre of the Thrkiha arme, cusbing of the commancation between it difierent forts. Smal with terror, the Tuns endeavoured to gan therer, when the whole of them perinied in the fa. 'The left divifon made a more obsinuse relitane, but it was at length defeated. About the end of $\dot{S}^{2}$ ptamer the reews of this vidony reached Frane, which recalled the memory of Donaparte's conqu la, as fombarg a thiking coment to tio reverles expericaced by the republic after that prriod. The directory receivel a delpatch from him on the roth of Uctober, which was read to the councils; and on the retin a menige anmonced the arrivat of Bomparte in France, tosether with his priacipal oficers. He was received at $P_{a}$ is with marts of difinction, although none conld tell why he had left his army and reimmed home. At Frane, and this time the parties in the government were equaliy fubverts balanced; and the affitance of Bonaparte was requalt- be directoed by both. The Jacobins were fuperior in the council of fisc hundred, and the Moderates in that of the Ancients. It was underfloud that Sieyes was attached to the latter party, on which account the Jacobins had made many unluccefsfal eforts to dimifs him from his ollice. Intriguing as the Jacobins were, they were fuily ontwitted by Sieyes, who had a plot ripe for exe cution, to overwhelm them in a moment. (nn the morning of the gth of November, one of the commit. tecs of the comacil of Arcienta gave in a report, that the country was in danger, propefing the fitting of the lowillatare to be adjoumel to St Cloud, about lix mile from Paris. The council of five hundred having mo leat right to queftion the authority of this decree, and as the ruling party was clearly taken unswares, the members gnse their lifent confent, and both councis met at the pha:e appointed on the 10 of November.

The coun il of five hundred received a letter from Lagerde, lecretary to the directory, informing them that four of it mewers latd redigned their offices, and that Barras was a priboner by order of Bonaparte, whom the council of Amicnts had apponted conmander of theis gatard. In the millt of their deliberations, General Bomparic entered the hall, accompanied by atout 27 whicers and grenadiers. He proceeded towards the chair where has bother Lacien fat as prefrient, when Hecat tumult enfued, and the epithets of a Cromwell, a Ciefor, and a whurper, were conferral upon him. The members prded forward upon him, and Arena a Coriicam endeavoured to difitateh him with a dagerer ; but he was refeued by hiv military attendants. A party of arwed men entered the hall, and carried of the pretident, when in a violent dobate which enfred, it was propoled that Bomapate dhould be declered an omlaw. Military mulic was foon leard approaching; a body of amed troops entered the hall, and the members were obliged to difperfe. The council of Aucients fet adide the contitution, and pafed a number of decrees. The diretory was abolihed, and an executive commition fublituted in its place, confilling of Bomaparte, Sieyes,

1-99. Kingem of My fore, was contered on a ceiconcant of the former race of its kings, ard the remaining eerriterics nere divided anong the Britith and their allies. The family of Tipyoo nere either taken or made a voluntay furrender, teing removed from that 1 art of the country, and allowed a docent anruty.

Z:maun Shah in the mean time invaded the country from the north-weth, advancing to the vicinity of Duthi, and fpreading terror and defolation wherever he come. Satiffied with plunder, however, he foon withdrew his forces; and the French army being detained in Egypt by a war with the Turt , as well as the want of thipping at Suez, Tippoo had to contend ingly againd the inited force of Britain and her allies in thofe eaftern regions.
${ }^{\text {¢1 }} ?$ A curtular goternment in France.

The plan of a new conftitution was prefented to the public by the confuls in the month of December 1799. According to this pian, 80 men, who had the power of nominating their own fucceflors, and wese called the confervative fenate, had likewife authority to elect the whole of the legillators and executive rulers of the it te, white none of thele offices could be held by themfelves. One man, called the chiff conf/ul, poffoffed the fovereign suthority, held his power for ten years, and was competent to be re-eleceed. Other two confuls were to affirt in his deliberations, but had no power to controul his will. The legillative power ras divided into two affemblics; the tiburate, compofed of 100 members, and the comervative fenate of 300 . When the clief cunfel thought proper to propule a lar, the tribunate might debate upon it, without having authority to vote rither for or againt it, while the members of the fenate might vote, but were not enabled to debate. The coniuls and the members of the legillative body, as well as of the confervative fenate, were not relponible for their conduct, but minititers of liate employed by them were underfood to be accountable. The committees which framed the contitution, nominated the perfons who were to execute the funcious of government. Bonaparte wav appointed chief conful, and Cambaceres and Lebrun fecord and third conful. Sieyes, as formerly, declined taling any acive part in the adminiffation of public affairs, and he rectived, as a gratuity for his fervices, an eitate belonging to the nation, called Cirofne, in the department of the scine and Oiline.

Bunaparte had not long been in poffelion of the reins of government, till he fent overtures for negotiating jeace with the allied powers at war with France; but it is to be prefumed that he did not wift for a general reace. Sepaate propofals were made to the different belligerent powers, no dubt with a view to diffolve the coaltion ; but the decrees of the convention whirh declared war againt all the powers of Europe, were not repealed by him. He departed from the forms fanctioned by the cultom of natiuns in carrying on diplomatic correfpondence, but addrefled a leter directly to his Britannic maje Aty, the fubtance of which was contained in two queitions; " whether the war, which had, for cight years, ravaged the four quarters of the globe, was to be eternal "" and "wether there were no nuens for Britain and France of coming to a good undertianding :" SatictaAtory, and we thirk, unenfucrable replies, were male to thefe queftions by the

Brition minitry, who dwelt much, and very juaty, on the bad fath of revolutionary rulers, and the intability of the govermments of France fince the fabverion of nomurchy. The overture trandinites to Vienna was of a limilur mature, and it experience fimilar treatment; bit the emperor of Rentia abandoned the coalition, probably on account of the fameful manner in which suwartiow had been treated, while cattying on the war in Italy and Switzerland.

Bonaparte on the 7 th of March, fent a metage to the legitative body, containing his orn ideas of the conduct and detigns of the Britith cabinet, and aturing them that he vould invohe peace in the midnt of battles and trimphe, and fwear to fight only for the happinels of France and the repole of the world. This meflage was followed by two decrecs ; the one calling, in the name of bonour, upon every foldier abfent on leave from the armies of Italy and the Rtine, to join them before the 5th of April; and the other appointing a feth army of referve of 60,000 men to be atiemiled at Dijon, under the immediate command ot the firk conful.

About this time the bellizerent powers were neat!y ready for opening the campaign in Italy and on thic Rhine. The Genoele republic was the only territory of any importance in Italy, which remained in the hands of the French, but the army by which they defended it was very much reduced fince the preceding year, and might be conidered as in a itute of mutiny, from the wint of pay, clothes and prasitions. The Auftians eazerly withed to obtain potietfion of Genoa and all its dependencies, in which they could not fail to be feconded by the Genoeie themielves, as they looked upon the republicans to be the detiroyers of their commerce. Mallena received the command of the army in Genoa, with extraordinary powers, and evinced himfelf to be a general of confummate abilitie:. Carrying a reinforcement of troops with hin. from Leons and Markilles, and reducing to order and obedience, by a judicious diltribution of rewards and punilhments, all whom he found ready to defert their ftandards, he foon found himielf at the head of a force fufficient to check the progrefs of the Auftrians, and keep the Genoele in fubjection. After a number of battles had been fought, he was obliged to retire into the city, where he muit foon have been compelled to furrender by famine, if General Melas had immediately blockaded it.

The appearance of the Britith fleet on the 5 th of A Britisin April, was the concerted fignal for Melas to make an attack upon Genoa, the communication between which pears of and France was thus cut off. Prior to the arrival of Lord Keith, a quantity of wheat and other provifions had been thrown into the city, by which means the army and the inhabitants were refcued from the confequences of immediate famine. The furrounding country was foon vanquihed by the Aultrianc; but as the gallant Maffena fitll lived in the expectation of fupplies tron France, he obitinately refufed to furrender the city. General Melas having nothing to apprehend from this army blocked up in Genoa, left General Ott to continse the blockade, and went $u$ ith his own furces againl Sauchet, who commanded another divifion of the French army.

A decigive battle was fought between Ceva and St
Lorenzo,

Fraree. Lorenzo, on the tha of May, in which the ratames

 movenceat. (Genera! Mela, bee une maker of the whate d parment of the suatione Alf. Beat the comprign (1) the Kline did unt oper in fu at a fav ourable maner to the Auhtims. The come of Thama droeted the atchdoke Charles to reion the comman! of the atay to Gencral Kray, who dition ued himfelf in fu han emine t manner ta Italy, durin2 the campayn of 199 . Of his military tuens theere cradd be only one ophon, an 1 his interrity and zeal had been futicients tried; but he had the nisfortune me: to be in edie as fome of the uther generals ! It is truly ridiculus to behold mes contending a'out triles, when earaged in matters of fuch wat imeonace as the flluation of their conaty. Duing the frot pro itious days of Rome, her grentent genera's were plebeians.

It could not be reanably expeated that fuch a diacordant amy, commanded by an able ower who had the misfortane not to be a n/hensan, wowid ever be able to mike head a ainit the veterans of France, led
on by fach an extmodinary geneal as Norea. The Hangatian troop, dis, the mielves rendy to be facrificed to the party difenions of their o.icers, would not frgit agaimt the enemy. The counzil of war at Yeama had feat Geneal Kray inltruations at the opening of the campaign, how he was to dif poie of his force, and having no geneal under him to fupport his own opirion, be was under the prinful neceitity of obeying his inlruations, whether he could aprove of them or not. Infurution of a ditalar nature had been tranfmitted to arreeau by the chief conful, but he indignantly refufed 2.) $\varepsilon_{\text {ght }}$ minder fech rellraints. He was no doubt concious that \#is pom knowledre of the military art was at leaft e alal to that of Bonaparte, while he was infi1 fee. beter acqu:inted wi:h the country, and there. fore be fent a cuarier to Pazis to acquaiat the conful, that if the crderi fer: him were to be rigidly obeyed, be dhould feel it his duty to refign his command, and azeert of an infertor flation. He arcompanied his re. fegnation sith a plan of the campainn which he had framed for himelf, the proprie:y of which imiantly fruck the chief conful, and therefore he was ordered to car:y on the war, according to his uwn judgement.

Gereral Morcau b ing thens wifcly left to adopt and execute his oun meafure, crofiel the Rhine, and drove the Auhtiam from one poft to another, till Kray, finding it impraticable to adopt offenfive meafures with a rebellous army, with diffected officers to command then, refolved to maintain his pofition at Ulm, and vait for andiatace from Viema. He was defeated at Soockach. Eugen, and Mofkirch, although he extiBited fully the talents of an able general ; but what tabents were able to counterat the pernicious confequeaees of treachery : At one time, when 7000 men received orders to advance, they intantly thew down their anms. Kray too phinly perceiving that it was abfoi.tely is wain to $2 \%$ mpt any thing of an offindive na-

 i.te, that their all "as in daygur. a Pute? e': © of groun. I with : :a French comman'ur. B.tern ith time of morchiag to, and cf crofer the Dirnhe, K: fent remforcements to the let baik is op $\%$ : t . $p$ p fate, in conlequence of which a battle was huto'b Hochate, in the vicisity of Bleninem, whese whto asain declared for the Fench, who made foco of the enemy pritoners, independent of the killed and wome ed lut by the Auftrians, of which we have feen no whe nate.

General Kray, fenfiole that his fituation was wrilou. left a trong gariton at Ulm, and marched a gaint tho enemy, attacking them at Newburg, which both hida condicted with determined bravery; but the Auftrian. after a long conteit, fell tacis on Ingolitadt. It may not imp:pperly be faid, that this battle decided the fate of Gemmany. The eleforate of Bavariz was now in the pofertion of the French, with other territuries of lefs $e$ stent; and as they approched the hereditary du minions of the emperor, men of renublican fentinent behaved with fuch effrontery, as to convince the cous: that no dependence coald the reafonably placed on armies compoled of fuch men. The imperial family, and the Britith ambarador, were openly infulted in the theatre, and the cry of peace, peace, was vociferated from different quarters

The ill fuccefs of General Kray alone could nut ex. Th. Frence cite fuch a fipirit, becaufe at this time the aftins of at Germuny were even in a more deplorable flate in Italy D , on unexo than upon the Danube. When the campaign onered pe trdy on the K hine, the arny of referve under the commandraty. of Bonaparte, which was formed at Dijun, bersn i: march. When the French rovemment decherd that this army was abore 50.000 iltong, and receiving daily reinforcements, few could be found who were difpofel to give any credit to the report. Sach as were friendly to the caufe of the aliies, were tamilling to :hors the French government fo much vigour, white it was in dutriouly circulated by the Jacolins of Germany, that it cuald not amount to more than $6=00$ men. The firft conful fet out from Paris on the $5^{\text {th }}$ of My, to take the command of an army, the ftrenth and deti nation of which had given rife to fo many congetures, and on recerising the troup cantored at Dijon, be prow ceeded towards Genoa. Having been a hort time ir the Pays de Vaud, he joined the anny of referye at tha foot of St Bcrnard, of which be immedintely adumed the command. It in certain that a very indiguificant force would have been able to areett the progrefo in Bonaparte while afcending the mountain; but either General Melas had heard nothing of its being in mo tion, or he had implicitly beliered the report of the It colins. In confequence of this ignorance or credult. the army of referve encountered no oppofition rill it seached the town of Aoft, of which the firit couful wet

Frace. i. . anded potchion. Having, with the mof afo. 1 Thiseg performace, paffed the fort of Hard, tec pro-
! $8=0$. ceeted on his :arch down the valley of Aof with iitt'o oppontion, till he arrived at the town of lote, Where the fablians were afienbled in force, but were didus to give way before the imnctuonty of the republicans, and poil themfles on the beights of Romano belind the Chinfella. It was of valt importance as commonding the faflage of the river, and was ocupied by 4000 cavalry, 5000 infantry, and a fow picces on camme. It was taken or the zoth of May, and the fort of Brunctie foon after, in conferpance of which the roded to Turin was now open. While the regulicans were eficting a patiage over St Bernard, the chief part of the Autrians under Melas were employed in the celebration of their victory over them at Nice, little fufpecting how foon they were to expericnce a fid reverie of fortune, and that the victors would very foun he vanquihed. General Melas, at leneth rouled from bis dream of iccurity, marched towards Turin with all lolible freed, in order to defend the Po, and frevenit the invaders from arriving at Vienna. He naturally cuncluded that Turin would be the fint important point of attack made by the French, but in this he was dereived; for while he prepared to difpute the pallage of the Po with the republicans, Bonaparte fuddenly turned to the left, and entered Milan on the 2 d of Ithe.

The army of Bonaparte was very numerous, but he anted magazines, artillery, and flores of every kind; tut underfanding that Pavia was the great depot of the Aufirian army, he fent his advanced guard againl it ander General Lannes, who made an eaily conquell of it, and found in it more than 200 pieces of cannon, $\delta: 00$ mukets, 2000 barrels of gunpowder, and a prodigious quanity of all lorts of provifions. Another of the chief conful's generals crofled the Po at Stradclla ; and having cut off the communication between General Nelas and the country of Piedmont, gained poffeffion of the Autiinn magazines at Piacenza, Cremona, and a number of other places on the banks of the river.

About this time it was that Bonaparte became acquainted with the fate of Genoa, by means of intercepted letters. Maffena did cyery thing in the power of bravery and perfeverance to hiep pofiction of the city; but afier he bad wituffed 15,002 of the inhabitant, pe. rih with hunger, he furrencered to the Britih and Auftian comnanders on the 5 th of June, and obtained very favourable terms, when we confider that it was imponible for him to hold out any longer. The right wing of his arny, confifting of 8110 men, was permitted to march into Fraice by the way of Nice, and the rell were to be conveyed by fea to Antile, at the experice of Britain; no man was to be deemed refponiible for having lield any public ollice under the government of the Ligurian republic; and all oflicers taken prifonern hince the commencement of the campaign, were allowed to return to France on their parole, not to ferte till they thould be regularly exchanged. By the fall of Genoa, the Aullian arny which befieged it uis at liberty to co-mperate with the commander in chief; and, accordingly, General Ott marched at the head of thirty battalions to check the progrefs of the French army i: Padmont. (In the yth of $\mathrm{J}_{\text {ne }}$ he was Leet by gencral) Lames and Victor at Montebello,
where a batle was fought with great fury on both fides, when the Fench were victorious, and General Ott r.treatew widh great lofs. Melas being unable to arrat the pragets of the republicans by detachmentio of lis amy, colleted his whele force betwen Alehaidria and torton, that he night be able to open a way tor himitis to the Auftian, ot the Mincio, if he thouht find it impulfible to cruft the enemy. The confequence of this ficp wa the ever memorable battle of Narengo, fuacht on the $14^{\text {th }}$ of Jure, which has been varionay defcrited. The riench accounts reprefented the army of General Melas a nore numerous than that of the chict conful, to whofe fuperior conduct and bravery alone the French were indebted for fuccuis. Others have believed that the fuperiority was on the fide of the republicans, and think they can difcover as muth from consparing together the different lulletins of the amy of referve. On this point we pretend not to decide. only it is certwin that the Autrians were victorious for ninc houss, and the fate of that batte aprears to have been decided by the materly condect of Gencral Defais, who died on the field. One falfe movement, made l, General Melas, which enfeebled his centre, aforded the galisnt Defaix an opportunity of making a vigorous diicharge with a body of cavalry that had hitherto been unemployed. Gencral Zach, a man worn out with age and fatigue, when about to take :he command of the army fiom Melas, fell into the hands of the cnemy, who remained matters of the field of battle.

The Autrians loft in this engagenent above gooo Great lof men, and the French upwards of 12,000 , according to of the luftheir own account. Enraged that the vietory Mould thie batule be thus fratched from them, the Aultiains were eager 4 marento renew the combat on the follosing day; but Gene-go. ral Melas deemed it prudent to chech the ardour of his troops, and concluded a capitulation, faid by fome to be unparalieled in the amals of war. He may have figned fuch a capitulation in confequence of infructions from the council of war at Vienna, or the fortrefles given up by him may have been dellitute of provifions. If we admit the firit fuppofition, it follows that the council of war were determined enemies to the cauie of the combined powers; and if we go upon the fecond, Melas himfelf was perhaps the noft improvident commander that ever was charged with the defence of a country. The whole of Piedmont and Genoa were given up to the French, and an aminitice was concluded, to laft till the court of Viema had time to return its opinion.

General Kray in Italy was anxions to avail himfelf of this armitice, to arrelt the progrels of Mroreau' army ; but that able general would not hiften to any overtures upon the fubject, till he thould receive inllruction.s ir in Panic. Count st Julien arrived with prepolais of pace from the Imperial cabinct, in conlequence of which, the armitice was concluded in Germany and Italy, the polts then occupied by the refpective armien beng conlidered as contituting the line of denarcations. In oppoition to the fpirit of their dipulatims wi:h General Mela, the French reinforced their urmy in I:afy, levied immenfe contributinns, and wifed troops in difierent thates declared by themelves to be indepenkut.
While France was everyntere viturious in Europe, her troops in Africa were fubjected to had hips and dif F e ch grace. Their being abanduned by their chief mate ' 10 ps in

France. them complain bitterly; and Kleber is faid to have declared, that the fame univerfe fhould not contain him and Bonaparte. He continued the negotiations begun by General Bonaparte with the grand vizier for evacuating Egypt, between whom a convention was concluded on the 24th of January 1800, to which Sir Sidney Smith agreed on the part of Great Britain. By virtue of this convention the republican army, its baggage and effects, were to be collected at Alexandria, Rofetta, and Aboukir, to be conveyed to France in veffels belonging to the republic, and fuch as might be furnilhed for that purpofe by the Sublime Porte. It would feem that nothing could have happened more injurious to the intereft of the allies than the evacuation of E gypt upon fuch terms, fince the conful would thus have been fumihhed with nearly 18,000 troops, which might have been advantageoully employed, either in Italy or on the Rhine. It is Alrange how this important circumflance did not occur to Sir Sidney Smith, and no le's fo, how he took upon him the office of plenipotentiary. Mr Dundas clearly proved in the houfe of commons, that he exceeded any power with which he could reafonably conceive himfelf vefted, that being lodged with Lord Elgin at Conflantinople.

In the latter end of the year ${ }^{1799}$, the Britilh miniftry had reafon to believe that a negotiation would take place between the grand vifier and General Kleber, refpesting the evacuation of Egypt by the troops of the latter; and as fuch an event was much to be defired, Lord Keith received orders to accede to it, on condition that General Kleber and his army fhould be detained as prifoners of war, inftead of being fent back to France. This was bitterly complained of in France, and numbers even in England exclaimed againft it as a flagrant breach of faith, while General Kleber himfelf did not confider it in fuch a light, although the only perion who had reafon to do fo, could he hase done it with fairnefs. On the 20th of March he attacked the Turks in the vicinity of Cairo, who tled befure him in all directions, and left more than 8000 men dead and wounded on the field of battle. By this conqueft Cairo was reftored to the French, which in terms of the convention they had abandoned. Kleber again propofed to evacuate Egypt, on the terms agreed to by the grand vifier and Sir Sidney Smith, and Lord Keith being ordered to agree to them by the cabinet of St James's, a furpenfion of hoftilities took place, and the Turks were ready to be delivered from enemies whom they were not able to expel, when General Kleber was fuddenly affiafinated.

Both parties had reafon to regret this event, as General Kleber appears to have been, not only the mott honourable, but by far the ableit commander of the republicans, in that quarter of the globe. It is not certainly known by whons he was murdered, nor who were the contrivers of fuch a plot, but at Conftantinople his fucceffor Menou was frongly fufpeeted. We mull confefs that he was not friendly to Kleber ; but on the other hand we do not find General Reynier, in his "State of Egypt," infinuate any thing of this wature againft Menou, although he treats his conduat and abilities with fome degree of contempt; and we are informed that the affatin himfelf, previous to his execution, folemnly acquitted Menou from being in the leatt acquainted with the plot.

Vol. IX Part I.

As Menou refufed to leave ligypt by cupituation, the Britih government formed the refolution of driving him out of it by force. Sir James Pultency reccived $18=1$. the command of $12,250 \mathrm{men}$, to act in the Mediter $\mathrm{Gr}, \mathrm{cit}$ ranean in fuch a manner as might moft effectually an- thertrom. noy the enemy; a plan which wis difconcerted by the by lath tar iflue of the battle of Narengo. He was fuperfeded by Egypt.
Sir Ralph Abercromby, who carried reinforcements along with him, together with a train of artilley from Gibraltar. He touched at Minorca and Malta, from whence he fteered his courle for the coaft of Egypt, which he reached on the ift of March 18:1, and anchored next day in the bay of Aboukir; but the weather prevented him from attempting to land till the $7^{\text {th }}$ of that month, at 10 o'clock in the forenoon. The firt divifion effected a landing in the face of the French, to the amount of 4000 men, whofe pofition was fo very advantageous, that an eye witnefs thought they might have refified the world ; yet 2000 Britith troops drove them from it, with the lofs of fome fieh pieces, and the difembarkation was continued during that and the following day.

The whole army of General Abercromby moved The Fren h forward on the 12 th, and coning in fight of the main body of the French, gave them battle on the 13 th. thll near The conflict was obitinate on both fides, and their lofs a exundria, very confiderable, but victory in the end declared for "tid Genethe Britihl. This advantage was followed up with wi- romby gour, and on the 2 It a more interefling battle womby fought with fimilar fuccefs, about four miles from the wranded city of Alexandria. Sometimes the French had the advantage, and fometimes the Britill, but the latter were finally vietorious. General Abercromby, that he riight not damp the ardour of his troops, concealed for two hours the anguifh of a mortal woma he received in this action :-a degree of magnanimity which has very feldom been cqualled, and we believe never was furpailed. The lols of the Britilh on this occalion was eflimated at 1500 , and that of the French at 4000 men.

As it may be faid that the fate of Egypt was de. The Norcided in a great meafure by theif two battles, we beg fel in Cracy. leave to call the attention of our realers to affairs of great importance which about this time took place in Europe. The powers of the north, envious of the fup eriority of Britain by fea, and acting under the influence of the capricious Paul, were refolved to revive the armed neutrality of Catharine. II. during the continuance of the American war, and claimed a right of trading to the ports of France, without being fulbjected to have their veffels fearched. The miniltry of Great Britain were determined to break fuch a confcleracy; but to the allonillment of the nation they religned at this period. Different caufes have been afligned for an event which was fo unexpected; but the ofteniole reafon was a difference in the cabinet relative to catholic emancipation. After the union of Ireland with Britain, it feems pretty clear that the minilter did propofe this fubject in the cabinet, but bis majelty, from a facred regard to his coromation oath, put his negative upon it, in conferquence of which Mr Pitt and his friends gave in their refignation. In gencrai they were fuc-a ${ }^{517} \mathrm{~m}_{8}$ e ceeded by men who had countenanced their admuitra-ot minaitry tion during the war. Mr Ad limeton was appointedtame firft lord of the treafury, and chancellor of the is

cherwa, Lard Eldon, lord nigh chanctilos; the carl of S: Vicent, firt lord of the admiralty; lords Hawkesbury and Pelham, lecretaries of ftate, and the honourat.le Colonel Yorke, fecretary at war. The former miniftry was diffolved on the 1 ith of Cebruary : but owing to the indifpofition of his majeity, none of the new miniltry cntered upon office before the middle of Narch, during which eventful interval Mr Pitt and his Uluciates had the chief management of public affairs. The new minillry entered upon office by folemnly pledging themfelves to the nation, that they would employ their united efforts in procuring a fafe and honourable peace with France, while they never loit fight for a moment of the warlike plans of thofe who had preceded them.

About this time the molt hoftile meafures were adopted by the powers compoing the northern confederacy. The free city of Hamburgh was taken by a Danilh army under Charles prince of Heffe , in order to injure the commerce of Great Britain; and the king of Pruffia fent a numerous army into the electorate of Hatover. To punifh this unaccountable conduct, and diffolve the northern confederacy, a fleet of 17 fail of the line, four frigates, four floops, and fome bomb veffels, was fitted out in the ports of Britain, which failed from Yarmouth on the 1 2th of March, under the command of Admiral Sir Hyde Parker, Lord Nelfon, and Rearadnaral Graves, and having paffed the Sound, appeared hefore Copenhagen on the seth of the fame month. The Danes did not appear in the fmalleft degree agitated, for it was imponifle to molcit either the fleet or the city, without paffing through a channel fo extremely intricate, that it was once believed hardly fafe to attempt it with a fingle fhip, and without any enemy to oppofe. This channel was founded by Lord Nelion, who undertcok to conduct a large divifion of the tleet through it, requefting from Sir Hyde Parker the command of it, which was accordingly given him, and Rear-admiral Graves was his fecond in command.

As the largeit fhips drew too much water for being emploved in fuch a hazardous attempt, his lordfhip felected 12 of from 74 to 50 guns, together with four frigates, four floops, two fire-1hips, and feven bombs. A moit prodigious force was oppofed to this, confifting of fix fail of the line, 11 floating batteries, each mounting from 26 twenty-four pounders to 18 eighteen pouncers, ore bomb-fhip, and onumber of fchooners. Thefe were fupported by the Crown iflands, mounting 88 nieces of cannon; by four fail of the line, moored in the : nouth of the harbour, and by a few batteries on the iland of Amak. Lord Nelfon attacked this tremendous force on the 2d of April, and filenced the firing If the batterics after an obftinate and bloody action which latted four hours, taking, burning, and finking obout 19 fail, including feven fail of the line. In kill$e!$ and wounded the Britifh loft 943 men, while that nit the Danes mult have been at leait double the number. A fufpenfion of hoftilities was the immediate confequence of this brilliant victory, and a treaty of armed reutrality to laft for 14 weeks.

After repairing the fthips that were damaged upon
this occafion, the Britilh fleet failed for Carlfcrota, and aprared before it on the 19 th of April. The governor here was immediately informed by the Britifh ad-
miral of rimat hat happened at Copenhagen, requefting his Swedinh majelty to give an explicit anfwer whether he meant to adhere to, or abandon the confedenacy. The reply was vety ambiguous; tut having received the news of the fudden death of the emperor Paul, on the 23d of March, and Lord Nellon, now commander in chief, writing in a more reremptory tone than the officer whom be had fuperfeded, the court of Stockholm deemed it prudent to follow the example of that of Copenhagen. Alexander, the fon and fucceffor of Paul, poffifed of more honour and jultice than his father, rettored all the Britith property which he had confitcated, relinquithed his abfurd claim to the inland of Malta, and agreed that neutral vefiels fhould be fearched, when bound for any one country at war with another, which proved the grave of the northern confederacy.

When the armiftice was figned between the Auftrian and French generals in the year 1800, the troops of the latter were in poffefion of Germany almolt to the banks of the Inn, and of Italy to the frontiers of Venice; but the fpirit of the emperor was yet unfubdued, and he would not abandon his allies by a confirmation of the preliminaries of peace which Count St Julian had agreed to at Paris, as he exceeded the powers with which he was entrutted. Kray having retired from fervice, the archduke John fucceeded him, with whom the emperor in perfon repaired to the army; but they foon found it impracticable to act an offenfive part againft General Moreau, and therefore another armiftice comprehending Italy, was agreed to. The emperor wifhed to include Britain in any treaty with France, but as Bonaparte would admit no plenipotentiary from that country without the benefit of a naval armiftice, which it was truly abfurd to expect, General Moreau received orders to go on with his military operations.

The army of Auftria was now given to the command of generals whofe very names were almoft unknown beyond the confmes of their own country, and who evinced themfelves but very little acquainted with den.
the military art. As Moreau was pondering on the plan of his winter campaign, the right wing of his army was attacked by the Auftrians with fuch vigcur, as had nearly reduced him to the neceflity of ativig on the defenfive; and had General Klenau known how to make a temperate ufe of his victory on this occafion, the ruin of the French commander would have been ineritable. The cafe was otherwife. Elated with his fuccefs, be unaccountably abandoned his pofition on the Itrn, and engaging his cautious and able antagonit at the village of Hohenlinden, was totally routed, with the lofs of 80 pieces of cannon, 200 caiflons, aad 10,000 prifoners, independent of a prodigious number left dead on the field.

General Moreau allowing the enemy no time to rally, procecded directly towards the Inn, croffing it on the 9 th of December, 1800 , and driving his enemies before him, ftruck the court of Vienna with conflernation and difmay. Prince Charles was recalled to the command of the a:my, but after many fruitlefs efforts to retricse its loit honour, he propofed an armiftice on the 27 th of December, which was granted by the French commander, on condition that it frouhd be immediately fullowed by a definitive treaty. If the archduke could have had any dependence on his army, although

## FR A [ 187 ] F R A

France, athough very much weakened, this armiftice, in all forn armilice was fonsed by a treaty of pence figned at Luneville on the 9 th of February 1801 , between the emperor for himfelf and the Germanic body, and the firit conful of the French republic, in the name of the people of France. By it the emperor ceded the Brifgau to the duke of Modena, for the territories lolt by that prince in Italy, and bound himfelf to find indemnities in the Germanic empire for all thofe princes whom the fate of war had deprived of their dominions. The grand duke of Tulcany was to renounce his dukedom for ever, with its dependencies in the inle of Elba, to the infant duke of Parma, for which the empire was to furnifh him with an adequate indemnification.

On the 28 th of March a treaty of peace was concluded between the French republic and the king of the Two Sicilies, by which his majefty cbliged himfelf to fhut all the ports of Naples and Sicily againit fhips of every defcription belonging either to the Britith or the Turks, till thefe powers hhould conclude a treaty with the French republic, and till Britain and the northern powers fhould come to a good underftanding. He renounced for ever, Porto Longano in the ifle of Elba, his ftates in Tufcany, and the principality of Piombino, to be difpofed of in fuch a manner as the French republic might think proper.

Great Britain had now none to affint her in the contelt with France, but the Turks in Egypt and the Portugucfe in Europe, powers which rather diminilhed than increafed her flrength, by dividing it. The Spaniards had made an attack upon Portugal at the defire of France, conquering fome of its provinces; but a traty of peace was concluded between them on the 6th of June, by which the king of Spain reftored all his conquefts except the fortrefs of Olivenza, and the prince regent of Portugal and Algarva promifed to Phut the ports of his whole territories againft the fhips of Great Britain, and to make indemnification to his Catholic majefty for all loffes and damages fuftained by his fubjects during the war.

When the chief conful had made peace with all his other enemies, he threatened Great Britain with an immediate invafion, which gave great uneafinefs at firit to a confiderable part of the nation, but it gradually fubfided. In order to diminilh this alarm, Lord Nelfon was fent to deffroy the fhipping and harbour of Boulogne. His fuccefs in this undertaking fell thort of the expectations which many had formed; but he made 1.ch an imprefion on the enemy on the $4^{\text {ti }}$ of Auguf, a, evinced that Pritain could annoy the coalt of France witn greater facility, than France could moleft that of Britain. It was alfo highly fatisfactory to find that the
 to the hero of the Nile; for Rear aomiral Saumarez having, in the month of Iuly, come up with a combined fyuadron of Freach a'd Spanifh thips of var bound for Cadia, much fuperior to his own, lie foruyled out to give them buttle, the confenuente of which
was, that one of them was captured, and two moee Frames. were burnt.

Attempts were again made by Britain during the 1802 , fummer of 1801 , to negotiate with Erance. The firlt Brit at st conful could not but fee, from the total dititolution of temptsto the northern confederacy, that it was impolible for himern. w it to ruin the Britifi commerce, and contequently that all France. the treaties he had made for the purpote of excluding our thips from neutral ports would tigmty nothing. He feemed determined, however, to keep polfelfion of Egypt; and Britain, on the other hand, was as fully refolved to wreft it from him. On this account the negotiations were protracted, till the conquelt of that country was known at London and Paris.

When Sir Ralph Abercromby died, General Hut. R 535, chinfon fucceeded to the conmand of the Britih forces Carro, and in Egypt, who was probably acquainted with the plan lexandria, of his much lamented predeceffor, as one firit fecrued the Britif. to actuate both. Rofetta foon furiendered, which was followed by the conquelt of Cairo; and Menou having accepted of fimilar terms for Alexandria, the whole of Egypt fell into the hands of the allies, and the republican troops and baggage were conveyed to the nearelt French ports in the Mediterranean, in hips furnifhed them by the allies. After thefe events, the negotiations between Britain and France went on more agrceably; and, on the it of October, the preliminarics of peace were figned at London by Lord Hawkefbury on the part of his Britannic majefty, and M. Otto on that of the French republic. By it Great Britain engaged to give up all the conqueits made during the continuance of the war, excepting the iflands of Ceylon and Trinidad. France was to reftore nothing. The Cape of Good Hope was to be free to all the contracting parties; the illand of Malta was to be given to the knights of the order of St John of Jerufalem; Egypt was to be: given to the Ottoman Porte ; Portugal was to be maintained in its integrity, except what was ceded to the king of Spain by the prince regent; Naples and the Roman itates were to be evacuated by the French, Porto Ferrajo by the Britifh, with all the ports and ilands occupied by them in the Mediterranean; and plenipotentiaries were appointed to meet at Amiens: for the parpofe of drawing up and figning the delinitive treaty. This was concluded on the 22 d of March i So: in confequence of which the French republic was acknowledged by the whole of Europe.

The reftoration of peace, after fo long and fanguinary Peace con a conteft, gave the higheff fatisfaction to all ranks and cluded a: denominations of men, with the exception, perhaps, of woun bra few interefted individuals; and it was certainly as ho- $\tan$ ald nourable to Britain as could well be expected from the Frame. nature of the war. It was celebrated at Paris, in the cathedral of Notre Dame, with great pomp and magnificence. The celebration of the re-etlahhiment of the Catholic religion in France, to which the majority of the people were warmly attached, gave additional importance to the fene is that country, and the meafure evinced the moft confummate political widom on the part of Bonaparte, whofe popularity in conferquence of it was very much increafed. We nuut now lay before our readers the celebrated Concordol, or convention colluded between Bonsparte and the pope, by which the Cutholi $f$ ath was ouain eftablithed in that coun-
1802. Ccpy of the late impartant Convention between the French Government and His Holinefs the Pope, Pius VII. ratificd the 23 d Fructidor, year 9, (10th September, 1801).

The chief conful of the French republic, and his holinefs the fovereign pontiff, Pius VII. have named as their refpective plenipotentiaries-
The chief conful, the citizens Jofeph Bonaparte, counfllor of thate; Cretet, counfellor of flate; and Bernier, doctor of divinity, curate of St Laud d'Angers; furnihed with full powers:

His holinefs, his eminence Monfeigneur Hercule Confalvi, cardinal of the holy Roman church, deacon of St Agathe ad Suburrum, his fecretary of flate; Jofeph Spina, archbifhop of Corinth, domeftic prelate to his holinefs, attendant on the pontifical throne; and Father Cafelli, his holinefs's advifer on points of theology; in like manner furnilhed with full powers in due form:

Who, after exchanging their full powers, have concluded the following convention :
Convention between the French Government and his Holinefs the Papt, Pius VII.
The government of the republic acknowledges that the Catholic, Apoftolical, and Roman religion, is the religion of the great majority of French citizens.

His holinefs, in like manner, acknowledges that this fame religion has derived, and is likely to derive, the greateft benefit and the greateft fplendour from the eftabiiinment of the Catholic worfhip in France, and from its being openly profeffed by the confuls of the republic.

This mutual acknowledgment being made, in confequence, as well for the good of religion as for the maintenance of interior tranquillity, they have agreed as follows:

Article 1. The Catholic, Apoftolical, and Roman religion fhall be freely exercifed in France. Its fervice thall be publicly performed, conformably to the regulations of police, which the government flall judge neceflary for the public tranquillity.
2. There fhall be made by the holy fee, in concert with the government, a new divifion of French diocefes.
3. His holinefs flall declare to the titular French bihops that he expects from them, with the firmeft confidence, every facrifice for the fake of peace and unity -even that of their fees.

After this exhortation, if they thould refufe the facrifice commanded for the good of the church (a refufal, neverthelefs, which his holine's by no means expects), the fees of the new divifion thall be governed by bilhops appointed as follows:
4. The chief conful fhall prefent, within three months -fter the publication of his holinef's bull to the archfiiboprics and bilhoprics of the new divilion. His holizefs fhell confer canonical inititution, according to the forms eflabliked in France before the revolution (avant \& changement: de , wonvernement).
5. The nomination to the bihoprics which become vicate is future, frall bixpuife belong to the chief con-
ful, and canonical inftitution fhall be adminiftered by the holy fee, conformably to the preceding article.
6. The bilhops, before entering upon their functions, flall take, before the chief conful, the oath of fidelity which was in ufe before the revolution, exprefled in the following words:
" I fiwear and promife to God, upon the Holy Evangelifts, to preferve obedience and fidelity to the government eftablifhed by the conflitution of the French republic. I likewife promife to carry on no correfpondence, to be prefent at no converfation, to form no comnexion, whether within the territories of the republic or without, which may, in any degree, difurb the public tranquillity: and if, in my diocefe or elfewhere, I difcover that any thing is going forward to the prejudice of the flate, I will immediately conmunicate to government all the information I poffefs."
7. Ecclefiattics of the fecond order thall take the fame oath before the civil authorities appointed by the government.
8. The following formula of prayer thall be recited at the end of divine fervice in all the Catholic churches of France.

## Domine, falvam fac rempublicam. Domine, falvos fac confules.

9. The bifhops thall make a new divifion of the parifhes in their diocefes, which, however, fhall not take effect till after it is ratified by government.
10. The bifhops fhall have the appointment of the parih priefts.

Their choice fhall not fall but on perfons approved of by government.
11. The bifhops may have a chapter in their cathedral, and a feminary for the diocefe, without the government being obliged to endow them.
12. All the metropolitan, cathedral, parochial, and other churches which have not been alienated, neceffary to public worhip, fhall be placed at the difpofal of the bifhops.
13. His holinefs, for the fake of peace and the happy re-eftablifhment of the Catholic religion, declares that neither he nor his fucceffors will difturb in any manner thofe who bave acquired the alienated property of the church; and that in confequence that property, and every part of it, fhall belong for ever to them, their heirs and afligns.
14. The government fhall grant a fuitable falary to bifhops and parih prieft, whofe diocefes and parifhes are comprifed in the new divilion.
15. The government fhall likewife take meafures to enable French Catholics, who are fo inclined, to difpofe of their property for the fupport of religion.
16. His holinefs recognifes in the chief conful of tho French republic the fame rights and prerogatives in religious matters which the ancient government enjoyed.
17. It is agreed between the contracting parties, that in cafe any of the fucceffors of the prefent chicf conful mould not be a Roman Catholic, the rights and prerogatives mentioned in the foregoing article, as well as the nomination to the bifhop's fees, fhall be regulated, with regard to him, by a new convention.

The ratifications thall be exchanged at Puris in the fipace of forty days.

## Regulations of the Gallican Church.

Pitle 1.-Of the Regulation of the Catholic Church, as connected with the Policy of the State.
Article I. No bull, refcript, decree, provifion, or any thing in the place of a provifion, or, in flort, any other difpatch from the court of Rome, even though it thould relate to individuals only, fhall be received, publifhed, printed, or otherways put in force, without the authority of the government.
2. No individual, affuming the character of nuncio, iegate, vicar, or apofolic commiflary, or whatever other appellation he may aflume, fhall be allowed to exercife his functions in France, but with the confent of the government, and in a manner conformable to the liberties of the Gallican church.
3. The decrees of foreign fynods, or even of general councils, fhall not be publifhed in France before the government thall have examined their form, their conformity to the laws, rights, and privileges of the French republic, and whatever might in their publication have a tendency to alter or to affect public tranquillity.
4. No national or metropolitan council, no diocefan fynod, no deliberative afiembly, fhall be allowed to be held without the exprefs permiffion of goverument.
5. All ecclefiaflical functions fhall be gratuitous, with the exception of thofe oblations which thall be authorized, and fixed by particular regulation.
6. Recourfe fall be had to the council of ftate in every inftance of abufe, on the part of fuperiors, and other ecclefiaftical perfons. The intances of abuie are ufurpation, or excefs of power, contravention of the laws and inftitutions of the republic; infraction of the rules confecrated by the canons received in France; any attack upon the liberties, franchifes, and cultoms of the Gallican church; and any attempt, which, in the exercife of worhip, can compromife the honour of citizens, arbitrarily trouble their confcience, or lead to oppreffion, injury, or public fcandal.
7. There fhall alfo be a right of appeal to the coun. cil of flate, on the ground of any attempt being made to interrupt the exercife of public worihip, and to infringe on that liberty which the general laws of the republic, as well as particular regulations, guarantee to its miniters.
8. An appeal fall be competent to any perfon interefted; and in cafe no complaint is echibited by individuals, the bufinefs thall be taken up officially by the prefects. The public functionary, ecclefiaflical or individual, who fhall with to exercile thic right of appeal, mutt addrefs a figned me:noir, containing a detail of the grievance complained of, to the counfellor of thte prehiding over religious affairs, whofe duty it will then become to make, with the leaft poffible delay, every inpiry into the fubject; and upon his report. the affuir
thall be definitively fitted, or fent back, according to the urgency of the cale, to the competent authorities.
$\qquad$
「ance

> Tilue II.-Of the Clergy.-Sect. I.-Gencral Reguia- lions.
Article 9. The Catholic worlhip thall be exercifed under the direction of the archbilhops and bihops in their diocefes, and under that of the curés, in their parifhes.
10. Every privilege derogating from ecclefaftical jurifdiction is abolithed.
11. The archbihops and bihops may, with the permiffion of the government, eftablinh in their diocefes cathedral chapters and feminaries. All other ecclefinatical eftablifhments are fupprefied.
12. Archbifhops and bifhops may adopt the title of citizen, or monfieur, as they fhall judge mott fit; all other qualifications are forbidden.

## Sect. 1I.-Of the ArchbiJops, or Metropolitans.

Article 13. The archbifhops thall confecrate and inftal their fuffragans. In cafe of failure, or refufal on their part, their place fhall be fupplied by the eldert bifhop of the metropolitan diftrict.
14. They fhall watch over the maintenance of doctrine and difcipline in the diocefes dependent on their fee.
15. They fhall hear and judge of complaints and appeals againt the conduct and decifions of the fuffragan bifhops.

## Sect. III. Of the Bißpops, the Vicars-General, and the Seminaries.

Article 16. No perfon can be named a bifhop who is not a Frenchman, and who is not at leaft thirty years of age.
17. Before the decree for the nomination is difpatched, he fhall be bound to produce an attellation of the correctnefs of his conduct and manners, furnifhed by the bilhop of that diocefe in which he fhall have exercifed the functions of the minittry; he flall undergo an examination refpecting his tenets, by a bilkop and two priels commiffioned by the chief conful, and who thall addrefs the refult of their examination to the counfellor of flate who prefides over the department of ecclefialical affairs.
18. The prieft, nominated by the chicf conful, flali endeavour without delay to procure installation from the pope; he fhall be permitted to perform no function till the bull authorizing his intallation fhall have received the fanction of government, and till he fhall have taken in perfon the oath prefcribed by the convention entered into between the French govermment and the holy fee. This oath hall be taken to the chief conful, and a minute of it thall be entered by the fecretary of it..te.

19: The bifhops fhall nominate and inflall the cures; they thall not honever make public their appointment, nor thall they give them canonical intrustion, till their nomination fhall have been agreed to by the chiei conful.
22. They fhall be bound to refide in their diocefes, and thall not be fuffered to quit them without the permation of the chief conful.
21. Each bimop thall be emporrerad to afpoint two, wid each archbithop three, vicars-general: they thall make cheice of them from among thole priefts who poiichs the requifite qualifications for being bilhops.

22 . They thall vifit amually in perfon a certain por$t$ ion of their diocefe; and within the face of five years the whole of it. In cale unavoidable circumitances thall prevent them from making this vilit, it thall be made by a vicar-general.
23. The bihops thall be bound to organize their feminaries, and the rules of this organization thall be fubmitted to the approbation of the chief conful.
2. Thofe who ftazll be chofen teachers in thefe feminaries thall fubicribe the declaration made by the French clergy in 1682 , and publifhed by an edict of the fance year. They fhall limit themfelves to teach enly the doctrine therein contained; and the bifhops fhall addrefs a certiticate of their abiding by this limitation, to the counfellor of fate who prefides over the ecclefiaftical department.
25. The bihops thall fend every year to this counfellor of flate the names of the fludents of thofe feminaries who are deftined to the holy minitry.
26. They fhall appoint no ecclefiallic who does not poffefs a property of the annual value of 300 francs, unlefs he has attained the age of 25 years, and poffefs the qualities required by the canons of France.

The bifhops thall perform no ordination before the number of perfons to be ordained has been fubmitted to the government, and by them agreed to.

## Sect. IV. Of the Curés.

Article 27. The curés thall perform no ecclefiaftical finctions bcfore they have taken, in the prefence of the prefect, the oath prefcribed by the convention entered into between the government and the holy fee. A copy of this oath thall be made out by the fecretary of the prefect-general, and regularly lodged with each party.
28. They thall be introduced to the poffeffion of their benefice either by a curé, or by a prieft whom the bifhop thall point out.
29. They ihall be bound to refide in their refpective parifhes.
30. The curés fhall be directly fubject to the bifhops in the exercife of their functions.
31. The vicars, and the affiftants performing their duties, fhall be under the fuperintendance and direction of the curés.

They thall be approved by the bilhop, and liable to be recalled by his authority.
32. No foreigner fhall be employed in the functions of the ecclefiaftical miniftry, without the permiffion of the government.
33. Every ecclefiaftic, though a Frenchman, is forbidden the exercife of ecclefiaftical functions, unlefs conreited with fome diocefe.
34. No prieft thall quit his diocefe to ferve in another, without the permiffion of his bilhop.
Sect. V. Of the Cathedral Chapters, and the Government of the Diccefes, during the Vacancy of the See.
Article 35: The archbifhops and bilhops who fhall wifh to exercife the power which is given them, by eftablifhing chapters, thall make nu appointment without having previoufly obtained the authority of the govern-
ment, not aniy fo: the eftablihnnent itfelf, but for the number and choice of the cccleffatics by whom they are to be formed.
36. Daring the vacancy of the fee, the metropolitan, or, in his flead, the oldeft of the fuffragan bifhops, fhall watcl over the governments of the diocetes.

The vicars-general of thefe diocefes ihall continue their functions after the death of the bilhop, till the inftallation of his fucceffor.
37. It thall be the duty of the metropolitans and the cathedral chapters to communicate to the government information of the vacancy of fees, and the fteps which may have been taken for the government of vacant diocefes.
38. The vicar-general, who thall govern during the vacancy, as well as the metropolitan and conftituent members of chapters, thall fuffer no innovation to be introduced into the ufages and cuftoms of the diocefes.

## Title III. Of Wor/bip.

Article 39. There thall be only one liturgy, and one catechiim, for all the catholic churches of France.
40. No cure thall appoint extraordinary public prayers in his parih, without the fecial permiffion of the bilhop.
41. No feftival, with the exception of the fabbath, thall be eftablithed without the permiffion of government.
42. The ecclefiaftics thall ufe, in the performance of religious ceremonies, the babits and ornaments fuitable to their titles.

They thall in no cafe, or under any pretence, affume the colour and the diftinctive marks refcrved to the bilhops.
43. All ecclefiafics fhall drefs according to the French fafhion, and in black. The hifhops fhall add to this coftume the paftoral crofs, and violet ftockings.
44. Domeliic chapels and oratorios, for the accommodation of individuals, thall not be eftablifhed without the exprefs permiffion of the government, granted on the application of the bithop.
4.5. No religious ceremony thall be folemnized without the temples confecrated to the catholic worhip, in places deftined to different forms of worthip.
46. The fame temple thall be exclufively confecrated to the fame fyftem of wormip.
47. There fhall be in the different cathedrals and parochial churches, a place fpecially appointed for the civil and military authorities.
48. The bifhop hall concert with the prefect the means of calling the faithful to religious worlhip by public bells, which are to be rung on no other occafion, without the permilfion of the lucal police.
49. When the government thall appoint public prayers, the bihops Chall coricert with the prefect, and the military commandant of the place, the day, the hour, and the manner in which thefe regulations are to be carried into effect.
50. The folemn inftructions known under the appel lation of fermons, and thofe ditinguifhed under the name defations, at the time of Advent and Lent, thall not be delivered but by priefts who have obtained the fpecial authority of the bifhop.
51. Tle cures in the ordinary exercife of their parochial duties thall pray for, and fhall caufe pravers to

A3. During the interal betwen the difurnt meetinfo, there diall be a direcher, comperial of the ptaiwhit. of the olden of the the eccleth Ricel infector: Whe of threc lumat, ane of whem hall be norimated Olt chitf chint and tie two cthens hall be choten $\because$ the genemal contitory
 Winctory had continue to ic dinccied ty the cufoms ond catutaions of the churches of the confeftion of Aurhar, in all puin:s which tove not teen formilly Useduy the laws of the republic or the prefent atticles.

When Bonapate was eiected frof conful for ten yeas, he was deemed competent to be re-elecied for i..e fume length of time; but he was afterwards chofen ior hie, with the itrange power conferred upon him of 1:ominating his fuccefior, or, in other words, of goveraing beyond the glave, than which wothing can Le conceive! more ridiculous or myjuft. Having ad vanced with fuch rafility in the acquilition of power Th suthonity it was exteme'y natural to conclude, wat the ambition of Bonaparte was not Catiated, but A 1. $1 \times$ would aterwade chan to himectf and infuence r isfatuated people to fanction, nill hicher degrees of athity mon! raacher. A book was accordingly pubin di. ciller with his permitlion, or by lin cxpects comand. pointing out the propricty and capediency of cretimb lima Firf Enperor of the Cianls! At a fubiequat rial of the hifury contained in this article vie imall See this caravasant provoltion actuall carsied into A Het, and Napoleons I. adernd with impee ial honours. 1hi, whime "1pet Dumarier afiented concerning the fremb, at :a ti:w when fiuh on a ont was hight inpowne ; "thet a hing aley wotad have."
In the cupecity of tinit crinfl, has power was fimion to that of lis brimeme mand, in refiect of criminals untice fintace of di.th, that he could grant them at l.i pheafue a plenary rardon, and admit them to return as...in to the bofom of ficiety; lout his csecutive auhto. ady ia almall cocry witics caie was dangerouly greater, as there was in fact no cother power in the flate which कuht porthly contur lim. While his euthority was Chthlited thus fimbly rithin his onn dominions, he shdeavoured to incaede his intluence over the ofll of Europe . by forming an :alliance with the court of Peiconhargh. At forlt it was believed to be purely of a comacocial noture, lat the :alive part tahen ly buth is difmendening the Germanic body, clearly evineed th:- fuch an alhifnce wa of a more interetting nature, autwithtarding the reflemfible reafon for fuctic conduct mat the intemiatio ation of the fufferers during the war.

It will jerhaps be adnitted, that the flate of Prance, .ffes the deadful convulions occafioned by the reveluCios, :suired an esecutive government of confilerable Promptitucie and vigour; yet it was furely pollible, and it wat i.o lefa a laced duty linding umon him, to confult, in paricular circumtlescer, the happinetis and prolperity of the people much more than be did, without
cadangcing in the fmalleft degree the flabiilty of his govermmen. The Fronch poopie ihould not have been dentived of the many bleflange refulting from a reprefentative qovernment; and if not ripe for it then, it theuld have becn confercel upon them at a fubferuent penived. If the heto of Maneno was afraid of facing a free parliment, he thas promurced himblf a tyant, and if unable to moderate is delliberations, very deffcient in political knowledge. He might find it eype dicut, fer inflance, to impole fome rettraints on the licentioufiels of the prels; but totaliy to amihilate its literty was as unjut as it was impolitic. He fhould have recollected a faying of an hiforian and philutopher, " that a whifipr may circulate as rapidly as a pamphlet."

Jowaris the tormination of the year $\mathrm{SOO2}$, Bonaparte was very active in his wintaticus of the fea-port towns, whate the molt fulfome addrefles wore prefented to him which were ever given to any montal being. Vaious conjectures were formed as to the probable defign of fuch vilits. It was thought by fome that he iatended to conciliate the affections of the peop'e, efnccially the military and the contituted authoriais; others imasined that it was to make hinfelf acquainted with the true thate of public opinion; while a thind clafy conjectured that it was with a view to increafo the navy of France, and acquire an intimate knowledge of the different parts of the coall. Whatever his olject wae, it is more than probable that it was disected to one point, and that his complicated movements were purpofely intended to milead thole who fclt an iatereft in watching him. It is true, he made no fecret of his determination to invade Grent Britain; but we nould greatly diminilh that howledge which he mut unquellionably poffefs, were we to conclude that he ever feriontly believed in the pralicability of fuch an undeitaking.
His abilitics as a foldier will be difputed by no man, character for when viewed only in this light, he is uaguetiomably of Eonasrout; but it would be a moft urpardonable breach of patt. truth to call lim an able politician. Whale he promiled to reftose the commerce of France, it continued to lansuith, more, prehaps after the rettoration of peace, than during the centinuance of the war. This feems to be a fulject ianiy beond his comprehenfion. Numbers in France dicii a great part of thir fubfitence from the expenditurc of luch perfion from the l'ritith dominions, as were difpofed, afor the return of peace, $t$, pey a vilit to the metronolis of the Gallic empire. But while ne thas freely animadvert on the conduct of the firlt conful, and point out his chor, or falt, without any relesve, we wihn not to conceal a fingle circumfatice which redounds to his honour. When Cambaceres, the billo ${ }_{i}$ of Caen, made application to the prefect of Rouen to have the Proteltant churd lee forcibly hat; ;.s foon as the requeit of the bihop was hnown to Bomapate, he fint for the fownd conful and twe lim, that if the bihop had not been ha L rother, he would have 1 ruch :im of the liah. Such a reply was certainly worthe of a great mat.

On the 2111 of February 1803 , a view of the fate c : France was lail before the legilative body and the tribunate, containing a comprelentive vicw of the rclations of the sepullic, both with relpect to colonies and forcign flates ; but the moll important pat of it had a reference

France to Brituit, whech was charged with seting improperly i) retaining roops in Malta and Egypt, after the fogan? of the secaitise treaty. It divided the inhabiants of ic into two partiec, repreleating the une a, having lwom i mpiazable enmity to France, and the other as anxious is mainain the relations of peace and amity, concluding with insular bravado, " whatever may be the fuccels of intrigue it: London, it will never force other nations, into neve !eagues: and the French government afferts, with jut pride, that England alone cannot now contend with France."
Whice pre- It now began to be manitelt, that the helinge of pirntat of peace were nut to be lang enjoved. The extenlive Erance. warike prenarations going forward about this time in
the posts of France and Halland, rowel the jenlonfy of the Britin minitry; for although the clendble reaton was to reduce the revoltad culonies to obedience, they could not helf apprehending that moch more was comprehended in fach extenfive armaments. We thall itill be more inclised to adopt this opinion, if we advert to the following circumflance. When Bomparte, on the 13th of Marcls, found Lord Whitworth and M. de Marcoff flanding together, he addrefed them in thefe vords: " We have fought for fitteen years, and it feems there is a itorm gathering at Londun, which may produce another war of fifteen years more. - The king of England has faid, in his meflage to the parliament, that France had prepared offenfive armaments; he has keen miltaken; there is not in the ports of France any confuterable force, they haviny all fet out for St Domingo. He faid there exitted lome differences between the two cabinets; I do not know of any. It is true that his majeitv has engaged by treaty that England fhould evacuate Malta. It is polible to kill the French people, but not to irtimiflate them." At the conclution of the drawing-room, it is faid that Bonaparte addreffed the Britith envoy thus, when near the door: "The duchefs of Dorfet has paffed the molt unpleafant feafon at Paris; I moft ardently with the may pars the pleafant one allo; fut if it is true that we are to have war, the refpontithility, both in the fight of God and man, will be on thote sho flall refufe to execute the treaty."

Much about the fame time a paper was inferted in the Hamburyh Correfondenten, containing much violent declamation againit Great Britain, and believed by nany to have been the production of Bonaparte. If our information be correct, the French miniter requefted, and obtained permi/hon, from the masiblrates of that city to make it thus public. Some alturations were made on the manufcript, which having given offence to the republican ambaffador, it was, on the 3oth of March, inferted without any altetations or dupiofed amendments. It contains many rancoruts expretions againlt Gieat Britain, while part of it leems to be a deligned apology for the infulting converfathon which took place at Madame Bonaparte's drawing room alrady mentionted. It containa fonse reflectio s allio on the freedom of difcuftion indulged in the Britith news-pavers relative to the affiair of France, 4 arcamitance for beneath the notice of the firl conful, $\because\}_{1}$, in this particular, did not advert to the freedom of the Brit:h prefs.

## F R A [ 196$] \quad$ F R A

France. Much about this period, General Mortier was waited upon by deputics from the regency, both of a civil and military nature, who begged that he would fufpend his marci, and propofed a capitulation. By this the Haaoverian troops were permitted to furrender on their parol, and agreed not to take up aras againt Fiance during the continnance of the sar. Suns were to be raifed for maintaining the repablican army, while private property was to be held facred.

If this promic, however, was really made, it does not appear that it was confidered as binding, for it has been fiid that more fla rant acts of crueity and injultice were farcely ever perietrated by people profeffing to be civilized. The following, ve are told, is part of the information upon this fubject communicated by private letterc." In the city of H nover, and even in the public ftreets, women of the highelt rank have been viclated by the lowell of the brutal foldiery, in the prefence of their hutban is and fathers, and fubiected at the fame time to luch additional and undefribahle outraces, as the brutal fury of the violators, intamed by datanconel, conld contive. No have ne heard that the phiwfuphers of Gretianen. the enthulialts of equabity and perfectibility, have heen at ail better treated." Whe fulie t that this picture is too lishly coloured; set, if a thoufandih part of the narration be true, of which we have only flected a tpecimen, we mult allow it to be an indelible Atigma on the French nation.

It budabways been a favourite obie:t with Ennaparte, to do acmen injury as polfible to the conmerce of Great Britain, and thercfore he now determined to thut a caint this comntry the ports of the Wefer and the Elbe; and alio infilicd on the ports of $D$ enmark being thut again!t veflels belonging to Britain, propoing to phant a Fench garrifon in the city of Copenhagen, while the other powers of Europe feemed to behold his conduct with indifference or thunefaction. The French having put themfelves in poflefion of the exclufive navigation of the Elbe, Great Britain determined to blockade it with thips of war, as a report then prevailed that Bon urarte would make ufe of that port for the parpote of invading Scotland. In this view of the matter, the conduat of Britain was hiohly commendable.

About this time the French army in St Domingo was in a moft metancholy conlition, as appeared from the information companed in fome intercepted let"S'. Aithough about 10,000 men reachel the inlond, in threc months after General Rochambeau's atrival, when they were landed in the different ports, fearcely any truce of a seinforcoment could be perceived, fo much had $h$ : army fuffered. The arocitics of the troops in their tum we ealfo faid * great, and romplaints made to the rommanding wicers were ans vered with threats. it apperts that Rorhombean was olliged to $\therefore$ we recourfe to abfolate balchood, in order to heep up the firis of his :ronps, and all ly the ir difontent; gising o.it, what he bnow could net ie the cale, that a reinfotcencat of $20.20=$ raen was daily expected.
Sutant it In the mon time, the nisitry of Great B itain uicd in a itate cvery chort th place the coment in a fecure and refiec.
propare for the wo:ft. The troops of the line were induftrioufly and fuccefffully recruited, the militia were called out and hept in active fervice, and an army of referve was raifed with the utmolt expedition. Having almoft 500,200 troops of difterent fpecies, Britain had no juft reafon to apprehend an invafion, being able to accomplith the dellruction of the boldeft invader. Thefe troops were encamped along the coaft, garriion towns were properly fupplied with men, the greateft fore was concentrated wherever the probability of a landing was tirongeft, and care was taken of the health of the military, as well as the appointment of the ableit generals to command them. Provifions, ammunition and ftores were collected in abundance. As it was natural to conclude that London would be the great objeet with an invading army, the utmolt attention was paid to the defence of thote parts of the coalt which are mofl adiacent to it.

Similar effort, were made to annoy the enemy by fea, and render their definns wholly abortive. 'Io Lord Keith and Admirai Montague vas entrufted the commund of the clomnel theet; ani an attempt was made at Granville to difoncert the preparations of France, by attachment of hips under the command of Sir James Saumarez, which was fo far attended with fuccefs as to intimidate the inhabitants, damage a number of houfes, and deftroy fome boats in the harbour. Similar atacks upon Catais and Boulogne alfo tended to convince the French refiding on the coalt that they were far from bsing tecure, although total deftruetion was not the confequence of fuch exertions. Lord Nellon then guarded the Italian feas, and Sir Edward Pellew and Sir Robert Calder ware fationed ofi Ferrol.

In the mean time the republican army in Hanover 245 continued to opprefs the inhabitants, and to devour the the Fiench refources of that clectorate. The Dutch were made to turards the fuffer almoft as much from their new allies and pretent- H moseed friends, as the inhabitants of a conquered country. They were dragged into a war of which they certainly wifhed to be the unconcerned fpectators, compelled to raife and maintain a large body of native troops, to receive garrifons into all their ftrong towns, to give up their lea-ports to the French, and expofe their whole country as a focne of paflige and encamprent to the armies of the republic. Their trade was ruined, and their ports blocked up by the Britih at fea, on account of thacir alliance with France. The inhabitants of the Belgic provinces belonging to France were alif devere fufferers by the levies of conferipts, the interruption which their trade and manufactures met with from the war, and the rigour by which they were governed. It was reported that the firlt conful had 300,000 effective men in readinefs along the coalt and the places adjacent, and that 2800 men were inceflantly employed, augmenting and repairing the fortifications at Bonlogne.
1)uring the month of November 1803 , the fea-coafts The brata of Great Britain and Ircland received freth additions of coaft ase Alrength, that if ever tioops from France fhould dare to toatified. at:empt a landing, they might be allured of meetins with a warm reception. The gartifon of Plymouth was augmented to $13,-200$ land men, beides 1500 feamen and marines. A battery was crested at Paul Point, for the defence of the Humber, and two others were to be built eppolite to it in Lincolmhire. Exertiond equally fritio I vere continued by fea. Sir Silney Smith croif-

France. ed of the Texel, and drove on thore on the codit of Holland, 12 armed thips of the eremy, thrce of which vere captured. During the month of February 1304 ,
the lrench and Dutch ports continued to be bluckaded b: the Britih navy with the utmof vigilance, a mealuse which the tempelluous nature of the weather frequentiy rendered hazardous. The preparation for an inwaton of this comitry vere fill continued on the part of France, hut no force of any confequence found it practicable to fut to fa, owing to the vigilance of our cruizers. A number of gunboats were taken at differe times off Boulogne, and different other parts of the lerench and Dutch eoafts, which might have comvinced the people of theie countrics of the adturdity of expecting to accomplifh any thing deciave againft Britain by fuch inadequate means:

A plan was fuggefted for filling up the ports of the e:zemy with itones and the hulks of old vellels, fo is to render it dithcult, if not wholly impracticable, either for hhips or fmall craft to make their way out of them. The idea feems to have been taken from a fiet well bnown, that harbours have been often rumed by the tides and currents of the fea, the depofition of fand from rivers, earthquakes, and ether accitents; and therefore it was coneluded that fimilar efiects might be produced by artificial meavs. The accomplihment of fuch an ofiect, it it were practicable, would be an ample compentation for the greatelt expence.

It was the epinion of the dicerning part of mankind, long before it happened, that the ambition of Bonaparte would not always remain fitisfied with the dignity of firf conful, even for life; for although he could rereive no frefh additions to bis power and influence, yet there was reafon to believe that the found of fuch titles as have alway, been deemed higher and more dignified fill, would be ton tafcinating for him to refit. Accordingly, on the 2 th of April 1804, the following decree was iffued by the tribunate of France.
" The tribunate, confidering that at the breaking out of the revolution, when the national will had an epportwity of manietting itlelf with the greatent freelom, the general wilh was declared for the individual wity of the fupreme power, and for the hereditary fuccultion of that power :
" That the family of the Bourbons, having by their cunduet rendered the hereditary government udious to the people, forced them to lofe light of its advantuoes, and drove the nation to feck for a happier deliny in a democratiral form of government :
"That France having made a trial of different forms of government, experienced from thefe trials only the miferies of anarchy :
"That the tate was in the greateft peril, when Bonaparte, hrought back by providence, fuddenly appeared for its falvation :
" That the confulbip for life, and the power granted to the firit conful of appointing his fucceflor, are not adequate to the prevention of intrigues at home or abroad, which could not fail to be formed during the weancy of the fupreme power:
" That in declaring that magitracy liereditary, conSormity is obferved at once to the evampie of all great 1twes, ancient or modern, and the firit $\because$ ins of the nistion, expreffed in $1-89$ :
"That, colightened and fupported by this experience, Fiance the nation row returns to this, wh more dlrongly than ever, and exptefle, it on all lices:

15 in $_{7}$.
"That whe: France demants for hee fecurity an hereditary chief, her gratitaie and afection call mo naparte:
" That France may exped siom the family of Bor naparte, more thin srom any viner, the maintinance of the rights and liberty of the people:
" That there is nu titie more fuitable to the glory of Bonaparte, and to the digonty of the fiprone chact of the French nation, than the title of emperor.
" The tribunate have come to the folloning vote:
"That Napoleon Bonapartc, the fill conful, bs proclaimed emperor of the French, and in that capacity be invelted with the government of the French reptiiic
" That the title of emperor and the imperial power be made hereditary in his lamily in the male line, ac. cording to the order of primogeniture."

The foregoing decree hav of been put to the vote, $i$. was carried by acclamation, with the fingle exceptic. of the only member (Carnot,) who delivered his ferte! ments againlt its adoption.

The fonate prefented an addref to the frrt conful, is ulich they took great pains to convince him that the fafety of liance, and the happinefs of Europe, depend ed entirely upun his aceptance of the title of Emperot of the French, and upon its being nade hereditaiy in his illuttrious family. The difierent diviions of the army of courfe fent addrefics to the lirf conful, intreating him to condefcend to become emperor of France.

Bonaparte requefted them, in his anfwer, "to makec known to him the whole of their thoughts." 'The fenate then defired him to take the imperial and hereditary dignity. Bonaparte confented.

An addrefs was prefented by the fenate to the firtt Eor: far conful, in which they employed man arguments to in made convince him (they might have fpared themfelves the emperer of trouble) that the prefervation of France, and the repofe Trance. of all Europe turned on his acceptanee of the dignitied title of the emperor of the Freuch, which right to be hereditary in his augutt family. The different divilions of the army hoped allo that be would be graciouly pleafed to condejecnd (what an intance of humility!) to become emperor of France. Whether or nut it may excite the aftonihment of our readers, we can affure them upon the moll undoubted authority, that he was fo humble as to accept of it, and the following is his addrefs to the confervative fenate.

## " Sfinators,

" Your addrefs of the 6th laft Germinal has never cealed to be prefent to my thoughts. It has been the olject of my molt contant meditation.
"You have judged the hereditary power of the fupreme magittacy necellary, in order to thelter the French people completely from the plots of our encmies, and from the agitations which arife from rival ambitions. It even appears to you, that many of our infitutions ought to be improved, in order to fecure for ever the triumph of cquality and jublic liberty, and prefent to the nation and to the government the double buarantee they are in want of.

* In projurtion as I lis my atte:"ion upon thefe great

 a fiment, which I have evprefled to you, ainl I foel mencol mone, that in a corcunatance as rew en it is impont, the councils of your wiftem and experience

- 1 :c apelf you then to make knowa to me the whole ,is yeur thoughts.
- The French people can add nothing to the hon. our and glory with which it has furromded nie: toat the mont facred duty for me, as it is the deme if to my heart,
 it has an ined be a revolution that has colt it to much, peti alially by the fectife of thote millions of brave - itizens whin have died in defence of their rights. Fif. twer years have pall fince, by a fontaneons movement :out ran to amm, you acquired liberty, erquaty, and alory. Thete firt blelling of nations are now tecured th you for ever, are hehered from every tempell, they are pemerved to you and your clidden; i:llitutions conceived and begun in the midd of the forms of incrio: and exterior wars, developed with couftancy, are iun terminated in the noife of the at:empts and pis of our mot mortal cnemies, by the adoption of every thing whel, the experience of centuris and of nations has demonimated as proper to guarante the ri flts which the wation had judged neceflary for it; diznity, its liberty, . 1 its liappinefs."
The ners emperor was allowed t) a hapt the children ar grand-children of his brothers, if arrived at the are If is years complete, and he without le fitimate children of his own; but this privilege cantort be enjoyed by his fucceflors. Failing both legitinate and adopted hirs, the crown fhall be enjoyed by Jefenh Bomparte and his defcendants; and failing. loferth and his deicendants, it hall devolve on Loais Bomapaste and his defcendants, \&ic. If a fucceilor cannot be found in any of thefe channcls, a Seratus comjulum, propoied to the fenate by the dignities (we prefume it thould have bera dignitaries) of the cmpire, and fubmitted for the acceptance of the people, inall nominate an emperor. It was alfo decreel that the members of the imperial family thould be called French princes, and the eldett fon of the family, the imperial prince. Among other things it was enafted, that every emperor, two years after he comes to the throne, bill fiver to maintain the integrity of the terrinory of the French repu'lis: We have mentioned this leil circumflance, wholly for
 rarity to the greater part uf our realers.

The tribl of the ftate pififueri commenced at Paris on the 29th of My 1sof. They were charged with confpiring againt the life and empernment of Bunaparie; but how great wos nor atonillment to find the juftly celebrated General Marcum induded in the number! Pnuy and joaloufy of Bunapartec can alone have implicated this great man in fuch a charese, as he was heard to lay on the arrival of the new cmperor from Esypt ;-" this is the man who in neceflary to hise France." Georges with 11 of his afociates, were c mdemetel and evecuted on the $\mathbf{2}$ th of Jone; the sallant Moreas and four more, wese fentere-d to fufie t two yeas impliforment, and about 18 were acquirat. Sime of theuf who were condemed were aftervard, pardoned hy imperial clemancy, moved ty the fafianoins chase of female clognctice and teme tears.

The fentence of impritoment againl iroveau was com- Finnee, muted to bammant tor lite to the United States of
Ansrica.

The coronation of Bonaparte took place intle nonth ${ }^{〔 49}$ of Derom' es 1804, which was accommanied on the part of tration of the people by tuch iemontrations of affarent $\mathrm{f}_{\mathrm{t}} \cdot \mathrm{i}$ - pasate. faction as crinced the degraded thate of the public mind in that untortanate country. itter raceiving a numbur of the ma fit fulome "foecte, filled entire? w with bombat and intichood, his imperial majefly detivered the fflowins adder "I atcend the thone, to which the unninaces wiacs os the fenate, the pople, and the army hav 'led me, with a heart penetrated with the grat d' in the people, whom, from the midat of came, I fint hatuted with the mume of Great. From $m$ y youth ; $m$ y thougtic have feen foldy finel upon then ( (oo it appears); and I mult add here, that my picalures and my pains are decived catirely from the happinet's or mixicy of my people. Ny defendants thatl lons preferve this throne (a very bold prediction). In the field they will be the firlt foldiers of the army, ficrificing their lives for the defence of their country. Is nagitrates they will never forest, that contempt of the laas, and the confution of iocial order, are only the refult of the imbecillity and uncertainty of princes. You, fenators, whofe counfels and fupport have never failed me in the molt difficult circumftances, your firit will be handed down to your fucceflors. Be ever the prop and frit counfellors of that throne, fo neceflary to the welfaze of this valt empire."

On the 4 th of February 1805 , a letter vritten by whowrite Bomaparte to his Britamic majelty on the fubject of aletter to peace, was lad before the legillative body by the coun-his Britanfellors of thate, in which he obferved that providence, nic majefly the fenate, the people, and the army, had called him on the rat to the throne of France. He admitted that the two jectice countries, over which they prefided as the chief magiifrate, might contend againtt each other for ages, but denied that it was for the interelt of either to continue the conteil. He requefted his Britannic majefty not not to deny himfelf the inexpreflible felicity of giving peace to the world ; for thould the prefent moment be lofl, he did not fee how all his efforts would be able to terminate the war, which he confidered as without auy object or prefumable refult. He concluded with offerving that reafon is fulliciently powerful to difcover means of reconciling every thing, when the wilh of reconriliation exiits on both fides. On the 16 th of the fame month, a very fplendid entertamment was given to the emperor and emprefs by the city of Paris.

Never was any naval vietory more glorious or de- The memocilive than that which was gained by the Britith under rabe batie Vice-admiral Lord Nelfon over the combined Heets of Tratal France and Spain, off Cape Trafalgar, en the 211l Oc-whreh Lord toher 185.5 The Britith commander in chief gave the velion teii fignal for bearing up in two columns as they formed in the order of failing, a mode of attack which had been presioully ordered by his lordaip, to prevent the delay and inconveniency of forming the line of battle in the mamer ulually adopted. The fleet of the enemy confilted of 2.2 hips , under the command of the French admiral Villeneuve. The Spanth divition under Admiral Cravina, formed the line of battle with great coo'mek and tkill, the heads of the dhips being turned t.: Le northward. The manner of attack was uncom-

 ! ff wing, of the allies was cut off, their right being by that time at Auferlitz, the head quarters of the Ruffan and Autrian emperors. From the teights of this plare the emperors witneded the total defeat of the R ofion ! !y the Eresch grard. The los futaine 1 by the allies during the whoie of this battle was eationated at $1: 2$ peces of camon, with 45 ftand of colours, and ix.020 Ruttians, a:d 600 Autirians were left dead on tic ied. On the 5 th of December an intervie eo took place between the emperors of Autria and France, which lafed for two hours. An armitice was mutually agreed to, which was to ferve as the batis of a def.nitive treaty. The emperor of Ruffia uas comprehended in this armitice, on condition of marching home his atmy in fuch a manner as the emperor Napocleon might thisk proper to preciribe. By vistue of the treaty of peace, the French agrecd to evacuate Bromn on the $4^{\text {th }}$ of January, Vienna on the 1cth, and the whole Aufttian ftates in fix weeks after the figning of the treaty, except fuch as were ceded to Italy and Bavaria.The Frenio It is certain, however, that the lofs of the Rufians account in this territle contlict was declared by the court of $\mathrm{Pe}-$ contralia. terffurgh to have been fhockingly exaggerated by the eit by the Ruflians. French bulletins, which made the allied army amount to 105,000 , while it appears that the Ruffians were only 52,000 throng, and the Autrians 17,000 . Accordding to the Ruffian flatement, they had not a deficit of more than 17, c00 men after that memorable battle, white the French papers made it 35,000 men killed on the feld and taken priloners, independent of $2=, 000$ who were drowned. Which of thefe contradictory reports is to be believed, we llall leave entirely to the judgment of our readers, who will probably think with us, that the one is perhaps too much diminihed, and the other rather exaggerated.

It would have required the invincible modefty of a Wallington, not to be elated with the extraordinary
fuccefs which attended the arms of Bonaparte in this laft attack upon Germany ;--a qualification which he feems never to have poieffed. After the battle of Auterlitz, his conduct was of confequence marked with the most horrid injuffice, tyranny, and rapine, both with refiect to Hanover and the unfortunate king of Naples. The unexpected tunn which the iffue of that battle gave to continental affairs, likewife changed the fentiments of the cautious, the intriguing, and myfterious king of Pruflia, on whofe co-operation the allies at a former feriod bad certainly fome reafon to calculate, although it does nut appear that he was ever derious in his nrueftoons of attachment to the intereft of Britain. He could drain ber coffers without granting her that eficelual affiftance which he fcrupled not to promife, but which he ne:cr intended to confer. Indeed it mult be confelied, that after the bat:le of Aufterlitz, when both Autria and Rufia were humbled by the Corsican ufurper, it would liave been nadnefs in Frederick to aim a blow ayaime France ; but why not aim it before, when in all fobability it would have been eminently fuccefful? We admire the king who withes to make his fubjects loappy, by keeping war at a diflance from them as riuchin as politible; but we deteft that fovereign as the worft of twindlers, who receives payment for fuch afitht-
ance to orther nations againft their infatiable enemies as France, he never denigns to grant.

The troofs of his Prulian majefly tock pofieffion of 1805 . Hinover; and the country of Aupach was ceded to the king of Bavaria, who received mis rovaly from the hands of Napoleon I. 'I he king of Naples took refuse in Sicily, heping thare :) be proveted from the vengeance of the felf-elesied moniach of France, by the united exertions of the rival Sorce of England, Rutlia, and Sicily. His Neapalion najetly no doubt often violated the treatics which te nade with France; but it ought in chariy to be rementered, that thefe tratites were made under the impulie of iear, the profperi of impeading detrsuation, and to prevent a band of robbers from plundering both him and his fubjects of their lait willing. When the affairs of the continent at any time wore a more favourable afpect, be no dount trampled on fach estorted treatie, in the hope of regaining that of which he had been unfutty deprived; and under fuch circumitances even in.tice ittelf cannot condemm him, and the dintates of humanity commiferate his misfortunes.
White the arms of Bonaparte were victorious in Eu- A ${ }^{558}$ nirat rope, his naval force in the Weft Indies received a Dukwerth freth proof that Britain reigns triumphant on the ieas. detents ${ }^{\text {French }}$ A fquadron under the command of Adeniral Duk. Firench worth, engaged and deftroyed a French liquadron on in :he Wein the 7 th of February, about 36 miles from the town of indies. St Domingo. Three of them, one of $8_{4}$, and two of 74 guns, were taken by the gallant admiral ; three of them made their elcape, and two of them were committed to the flames, viz. of $9_{4}$, and other of 125 guas The lofs fultained by the Britilh on this occation was comparatively fmall, confidering the advantages of the conquelt, the total amount of the flain being 74 , and of wounded 264. Nuch about the farte time the important news of the furrender of the Cape of Good Hope arrived in Britain, an expedition which had been wifely entrufted with Admiral Sir Home Popham, and General Sir David Baird.

From the humbled fituation of the emperor of Germany after the memorable batile of Aufterlitz, it was natural to expect that he would feel it his intereft to make peare with the French emperor, and therefore we thall lay before our readers the treaty of Prelhurg, which was figned and ratified on the 26th and 27 th of December, 1805 . It confifts of twenty-three articles, and forms no bad fpecimen of the kind of treaties the powers of Europe have to expect from Bonaparte, when the fortune of war enables him to dictate the terms.

## Treaty of Peace between Auldria and France.

His majeity the emperor of Germany and Aultria, and his majeity the emperor of the French, king of Italy, equally animated with a defire to put an end to the calamities of war, have refolved to proceed without delay to the conclufion of a definitive treaty of peace. This treaty contains 24 articles, of which the following are the principal, and indeed the only ones that are interelling to thofe ftates who are not immediately concerned in the treaty.

Article 1: There thall be from the date of this day, peace and friendfhip between his majefty the emperor

## F R A $[201] \quad F \quad R \quad A$

France. of Germany and Auftria, and his majetly the conperor of the French, king of Italy, their heirs and fuccellors, their flates and fubjects refpectively, for ever.
2. France fhall continue to poffefs in property and fovereignty the dachies, principalities, lordihips, and territories beyond the Alps, which were before the prefent treaty united and incorporated with the French empire, or governed by the laws and government of France.
3. The emperor of Germany and Aufria, for himfelf, his hcirs, and fuccefiors, recognizes the difpofitions made by his majerty the emperor of France, king of Italy, relative to the principalities of Lucca and Piombino.
4. The emperor of Germany and Auftria renounces, as well for himfelf as for his heirs and fucceffors, that part of the ftates of the republic of Venice, ceded to him by the treaties of Campo Formio and Luneville, fhall be united in perpetuity to the king of Italy.
5. The emperor of Germany and of Auftria acknowledges his majefly the emperor of the Freach as king of Italy; but it is agreed that, in conformity with the declaration made by his majefty the emperor of the French, at the moment when he took the crown of Italy, that as fuon as the parties named in that declaration thall have fulfilled the conditions therein exprefied, the crowns of France and Italy hhall be feparated for ever, and cannot in any cafe be united on the fame head. His majelty the emperor of Germany binds himfelf to acknouledge, on the feparation, the fuccelior his majefly the emperor of the French fhall appoint to himifelf as king of I:aly.
6. The prefent treaty of peace is declared to comprehend their mooft ferene highneffes the electors of Bavaria, Wirtemberg, and Baden, and the Batavian republic, allies of his majeity the emperor of the Freach, in the prefent war.
7. The eleators of Bararia and Wirtember having tuken the title of king, without ceafing neverthelefs to belong to the Germanic confederation, his majelly the emperor of Germany and Aultria acknowledges them in that character.
8. His majefty the emperor of Germany and Auftria, as well for himelf, his heirs and fucceffors, as for the princes of his houfe, their heirs and fuccelfors refpectively, renounces certain principalities, lordhips, domains, and territories. [Thefe are fpecined in the treaty, which declares alfo by whom they are hereafter to be held.]
14. Their majefties the kings of Bavaria and Wirtemberg, and his moft ferene highnefs the elector of $\mathrm{Ba}_{-}$ den, fall enjoy over the territories ceded, as well as over their ancient ellates, the plenitude of fovereignty, alld all the rights refulting from it, which have been guaranteed to them by his majefly the emperor of the French, hing of Italy, in the fame manser as his majeily the emperor of Germany and Autiia, and his majefly the king of Pruffia, over their German flates. His majefty the emperor of Germany and Auftria, both as thief of the en.ifre, and as co-ellates, ensqges hirifelf not to uppole any obflacle to the execution of the ats uhich they may have made, of will make, im wride quence.
15. His majefly the cmperor of Germary and Auf Vol. IX. Part I.

11ia, as well for himfelf, his heirs and furcentors, as for the prinaces of his houle, their heirs and fucceffors, renounces all the rights, as well of fovercignty as of paramomnt aight to all pretenfions whatloever, actual or eventual, on all the ttates, withont exception, of their majetlies the kings of Bavaria and Wirtemberg, and of his mott ferene highnels the elector of Baden, and generally on all the ftates, domains, and territories, com prifed in the circles of Bavaria, Franconia, and Swabia, as well as to every title taken from the faid domain and territories; and reciprocally, all pretentions, actual or eventual, of the faid itates, to the charge of the hotie of Aultria, or its princes, are, and thall be, for ever ex tinguifhed.
17. His majefty the emperor Napoleon guarantees the integrity of the empire of Auftria in the flate in which it ihall be in confequence of the prefent treaty of peace.
18. The high contracting parties acknowledge the independence of the Helvetic republic, as eftablihed by the act of mediation, as well as the independence of the Batavian republic.
25. All commercial communications and relations are re-eftabliihed in the two countries on the lane footing as before the war.
21. His majefty the emperor of Germany and A.f. tria, and his majelty the emperor of the French, hing of Italy, ihall maintain between them the fame ceremonial as to rank and etiquette as was obferved before the prefent war.
23. Immediately after the exchange of the ratification of the prefent treaty, commiffaries fhall be named on both fides to give up and to receive in the names of their refpective fovereigns, all parts of the Venetian territory not occupied by the troops of his majefty the emperor of the French and king of laly. The city of Venice, the Langnes, and the poffellions of Terra Fisma, thall be given up in the fpace of 15 days; Venetian Ittria, and Dalmatia, the mouths of the Cattoro, the Venetian iles in the Adriatic, and all the places and forts which they contain, in the fpace of fix weeks from the exchange of the ratifications. The refpective commiffaries will take cate that the feparation of the artillery belonging to the republic of Venice from the Auftrian artillery be exactly made, the former being to remain entirely to the kingdom of Italy.

Done and figned at Preburg the z6th of December, 1805.

$\underbrace{\text { Fince tec Fiance duting a period of mare that: } 15 \text { year oith, }}$ it is haped, from its conciferefs and pertpicuity, $t=$ ic. ceptalle tu sur iealers; and with this we conclude ots: hillorical detait of thefe remarkable events.
"Popular infurcetions, a+1 an army (fase the auRite dind
 lim in their homege, Nill preferved for fome tine his adorer, and that litile cabal which was for ever exalting him to the tkies. But as he was inferior cven to the duke of Orleans in military talents and difpolitions, he was as little calculated to be the leader of a revolution, or of a great confiracy: for which reaton his panegyrilts then confined themielves in their pemplilets and placards, with which the capital was overtun, to infinuating that the only means of faving the flate was to dechare M. Necker diciator ; or at leaft to confer upon him, under fome title more confitent with the monarchy, the authority and porers attached to that repullican office. In fact, if after his difmilion, in the month of July ${ }^{1789}$, he had dared to make this a condition of his return to the miniftry, it is more than probable that the king would have been under the necellity of agreeing to it, and perhaps of re-eftablifhing in his perfon the office of mayor of the palace. At that moment he might have demanded any thing : cight days later, he might have been refufed every thing; and very foon after, he was reduced to fneak out of the kingdom, in order to efcape the effects of the general contempt and cenfure which he had brought upon himfelf.

General La Favette, who then commanded the Parifian national guard, gathered the wrecks of all this porularity, and might have turned them to the greateft advantage, if he had poffeffed 'that refolute character and heroic judgment' of which Cardinal de Retz fpeaks, and 'which ferves to diflinguifh what is truly honourable and ufeful from what is only extraordinary, and what is extraordinary from what is impofible.' With the genius, talents, and ambition of Cromwell, he might have gone as great a length; with a lefs criminal ambition, he might at leaft have made himfelf matter of the revolution, and have directed it at his pleafure : in a word, he might have fecured the triumph of whatever party he fhould have declared himfelf the leader. But as unfit for fupporting the character of Monk as that of Cromwell, he foon betraved the fecret of his incapacity to all the world, and was diftinguithed in the crowd of conititutional ringleaders only by his three coloured plume, his epaulets, white horle, and famous faying' Infurrection is the mott facred of duties when oppreffion is at its height.'
"The revolution, at the period when the faction that had begun it for the duke of Orleans became fenfible that he was too much a coward to be the leader of it, and when La Fayette difcovered his inability to conduet it, was too far advanced to recede or to ftop; and it continued its progrefs, but in a line that no other revolution had taken, viz. without a military chief, without the intervention of the army, and to gain triumphs, not for any ambitious confpirator, but for political and moral innovations of the mott dangenous nature; the mort fuited to miflead the multitude, incapable of compreliending them, and to let loole all the palfions. The more violent combined to deltroy cvery thing ; and their fatal coalition gave birth to Jacobinifm, that territle moniter, till then unknown, and till now not fufficiently unmaked. This monfler took upon itfelf alone to carry on the revolution; it directed, it: exccuted, all the operations of it, all the explofions, all the outrages: it cvery where appointed the moft active leaders,

## 

Farce. leaders, and, as inllruments, employed the profligates of every country. I:s power far furpaffed that which has been attributed to the inquilition, and other fiery tiibunals, by thofe who have fpoken of them with the greatett exaggeration. Its centre was at Paris; and its rays, formed by particular clubs in every town, in every little borough, overfpread the whole furface of the kingdom. The conftant correfpondence kept up between thofe clubs and that of the capital, or, to ufe their own expreflions, des Sociétes populaires afilier avec la Suciété mere_-' between the affiliated popular Societies and the parent Socicty, was as fecret and as fpeedy as that of free-matons. In a word, the Jacobin clubs had prevailed in caufing themfelves to be looked up to as the real national reprefentation. Under that pre. tence they cenfured all the authorities in the moft imperious manner ; and whenever their denunciations, petitions, or addreffes, failed to produce an immediate effect, they gained their point by having recourfe to infurrection, affalfination, and fire. While Jacobinifm thus fubjected all France to its controul, an immenfe number of emiffaries propagated its doctrines among foreign nations, and prepared new comquetls for it.
"The national affembly, the capital, indeed we may fay all France, was divided into three very dillinet parties. The moft confiderable in number, but unhappily the weakeft through a deficiency of plan and refulution, was the party purely royal : it was adverfe to every kind of revolution, and was folely defrous of fome improvements, with the reform of abules and pecuniary privileges:-the moft able, and mort intriguing, was the conftitutional party, or that which was defirous of giving Frauce a new monarchical conflitution, but modified after the manner of the Englilh, or even the American, by a houfe of reprefentatives. The third party was the mof dangerous of all, by its daring fipit, by its power, and by the number of profelytes it daily acquired in all quarters of the kingdom: it comprifed the democrates of every defcription, from the Jacobin clubs, calling themfelves Friends of the comfitution, to the anarchs and robbers.
" The democratic party, which at firf was only auxiliary to the conftitutional one, in the end annihilated it, and became itielf fubdivided into feveral other parties, ubofe fatal ftruggles produced the fubiequent revolutions, and may ftill produce many more. But in principle, the contitutionalifs and the democrates formed two diftinct, though confederate, factions; both were defrous of a revolution, and employed all the ufual means of accomplifhing it, except troops, which could be of no ufe to them, for neither of them had a leader to put at the liead of the army. But as it was equally of importance to both that the king flould be deprived of the power of making ufe of it againft them, they laboured in concert to diforganife it; and the com-
crates, in which they mutually made conctlions and :acrifices.
"Be that as it mat, this abfurd conftitution, the everlatting fource of remorle or forrow to all who bore part in it, might have beent got over without a thock, and led back to the old principles of monarchicel government, if the allembly who framed it lad not feparated before they witnefled the exccution of it ; if. in imponing on the king the obligation to maintain it, they had not deprived him of the power and the means; and above all, if the certain contequence of the new mode of proceeding at the elections had not been to fecure, in the fecond afiembly, a confiderable majority of the democratic againt the comitutional party.
"The fecond affembly was alfo divided by three factions, the weakelt of which was the one that wihed to maintain the conflitution. The other two were for a new revolution and a republic; but they differed in this, that the former, compofed of the Brilotins and Girondits, was for effecting it gradually, by beginning with divefting the king of popularity, and allowing the public mind time to wean itfelf from its natural attachment to monarchy ; and the latter, which was the lealt numerous, was eager to have the republic citablinhed as foon as poflible. Thefe two factions, having the fame object in view, though taking different ronds, were necellarily ausiliaries to each other; and the pamphlets, excitations to commotion, and revolutionary meafures of both, equally tended to overthrow the conititution of ${ }^{1791}$.
"Thofe different fizions, almoft entirely compofed of advocates, folicitors, apoflate prielts, ductors, and a few literary men, having no military chief capable of taking the command of the army, dreaded the troops, who had fisorn allegiance to the conftitution and otedience to the king, and who moreover might be influenced by their officers, among whom there itill remained fome royalits. The furelt way to get rid of all uneafineis on this fubject, was to employ the army in defending the frontiers. For this purpofe a foreizn war was necenary, to which it was known that the king and his council were equally averfe. No more was wanting to determine the attack which was directed, almor at the fame time, againtt all the miniters, in order to compel them to retire, and to put the king under the neceffity of appointing oihers more dilpufed to fecond the views of the parties. Unhappily this attempt was attended with all the fuccefs they had promifed themfelves; and one of the lirit azts of the new minilly was to declare war againft the emperor. At the fame time, the emigration that had been provoked, and which wav almoft everywhere applauded, even by the lowett clafs o: people, rolbed France of the flower of the royal party, and left the king, deprived of his belt defenders, expofed to the fufpicions and infults that forang from inntmerable calumnies, for which the difatlers at the beginning of the war furnilhed but too many opportunitues.
" In this manner was prepared and accelerated the The fecur: new revolution, which was accomplibhed on the 1 oth revolutus of Auguft 1592, by the de;osition and imprifonment of the king, and by the mott tlagrant violation of the confitution of 179 i . The latter, however, "as net entirely abandoned on that day ; for the project of the Giroudifts, who had laid the plut of that horrible con'ri

## F R A | 204 ) F R A

है? $e$. ract, was then ouly to dectare the king's depoftion, in order to place the prince royal upon the throne, under the guidance of a regency compofed of their own creatures; but they were hurried away much farther than they meant to go, by the violence with which the molt furious of the Jacobins, who took the lead in the infurrection, conducted all their enterprifes. The prince royal, imftead of being crowned, was fhut up in the Temple; and if France at that moment was not declaed a republic, it was lefs owing to any remaining refpect to the conftitution, than to the fear the legillative body was in of raifing an army againt it, and alfo the majority of the nation, who would naturally be angry to fee a confitution which feemed to be rendered fccure and ftable by fo many oaths, thus precipitately averthrown, without their having been confulted.
"It was oa thele confiderations that the opinion wa, adopted, that a national convention floould be convoked, to determine the fate of royalty. Prompt in feizing all the means that might enfure the fuccefs of this fecond revolution, the affembly, under pretence of giving every polible latitude to the freedom of elections, decreed, that all its members ihould be eligible for the national convention.
" From that moment the Girondifts daily loft ground, and the moft flaming members of the democratic party, tupported by the club of Jacobins, by the new commune of Paris, and by the tribunes, made themfelves maiters of every debate. It was of the utmoft importance to them to rule the enfuing elections; and this was fecured to them by the horrible confternation which the maflacres of the 2 d of September fruck throughout the kingdom. The terror of being affaffinated, or at leaft cruelly treated, drove from all the primary affemblies, not only the royalifts and conftitutionalifts, hut moderate men of all parties. Of courfe, thofe afiemblies becane entirely compofed of the weakeit men and the greatelt villains exifting in France ; and from among the moft frantic of them were chofen thofe members of the convention who were not taken from the legillative body. Accordingly, this third affembly, in the firft quarter of an hour of their firft fitting, were heard fhouting their votes for the abolition of royalty, and proclaiming the republic, upon the motion of a member who had formerly been a player.
"Such an opening but too plainly fhewed what was oo be expected from that horde of plunderers which compofed the majority of the national convention, and of whom Robefpierre, Danton, Marat, and the other singleaders, formed their party. That of the Briffotines and Girondifts ftill exitted, and was the only one really republican. Thefe femi-wretches, glutted with the horrors already committed, feemed defirous of arrelling the torrent of them, and laboured to introduce into the affembly the calm and moderation that were neceflary to give the new republic a wife and folid orgauization. But the fupcriority of their knowledge, talents, and eloquence, which their opponents could not difipute, had no power over tigcrs thir!ing for blood,
a third revolution, already brewing in the brain of Robefyicrre. Fear had greatly contributed to the two former: but this was eflected by terror alone, without popular tumults, or the intervention of the armies; which, now drawn by their conquefts beyond the frontiers, never heard any thing of the revolutions at home, till they were accomplifhed, and always obeyed the prevailing faction, by whom they were paid.
" By the degree of ferocity difcovered by the members of the convention in paffing fentence upon the king, and in the debates relative to the conflitution of 1793, Robefpierre was enabled to mark which of the deputies were likely to fecond his views, and which of them it was his part to facrifice.
" The people could not but with tranfport receive a conflitution which feemed to realife the chimera of its fovereignty, but which would only have given a kind of conflruction to anarchy, if the execution of this new code had not been fufpended under the pretext, belonging in common to all acts of defpotifm and tyranny, of the fupreme law of the fafety of the fate. This fufpenfion was effected, by eftablinhing the provifionary goverument, which, under the title of revolutionary government, concentrated all the powers in the national convention until there fhould be an end to the war and all inteftine troubles.
" Although the faction, at the head of which Robefpierre was, had a decided majority in the affembly, and might confequently have confidered themfelves as really and exclufively exercifing the fovereign power, he was a demagogue of too defpotic a nature to ftomach even the appearance of fharing the empire with fo many co-fovereigns. He greatly reduced their number, by caufing all the powers invefted in the national affembly by the decrees that had eftablifhed the revolutionary government, to be transferred to a committee, to which he got himelf appointed, and where he was fure of the fole rule, by obtaining for colleagues men lefs daring than himfelf, though equally wicked; fuch as Couthon, St Juft, Barrere, and others like them. This committee, who had the affurance to fyle themfelves the Committee of Public Safety, very foon feized upon both the legillative and executive powers, and exercifed them with the moft fanguinary tyranny ever yet heard of. The minifters were merely their clerks; and the fubjugated affembly, without murmur or objection, paffed all the revolutionary laws which were propofed, or rather dictated, by them. One of their moft horrible and decifive conceptions was that of thofe revolutionary tribunals which covered France with fcaffolds, where thoufands of victims of every rank, age, and fex, were daily facrificed; fo that no clafs of mea could be free from that llupifying and general terror which Robcfipierre found it nccefiary to fpread, in order to eltabliih and make his power known. He foon himfelf dragged fome members of his own party, fuch as Danton, Camille des Moulins, and others, whofe energy and popularity had offended him, before one of thofe tribunals, where he had them cendemned to death. By the fame means he got rid of the chief leaders among the Brifotines and Girondifts; while he caufed all the moderate republican party, who were hill nembers of the aifembly, except thofe who had time and addrefs to efcape, to be fent to prifon, in order ta be fentenced and executed on the firn uccation.

## F R A

fit. The revolationary tribunals were furprowed, $v d$ the prilons thrown open to all whom they had call into them.
"Thi, fourth revolution, in which the faction then the ${ }^{5^{6}}{ }^{4}$ efteemed the moderate party overthrew the trrorifs, timon of and feized the fupreme power, was no lets complete ${ }^{\text {'793 }}$ than thole which had preceded it, and produced the conflitution of 1795. All France received as a great blefling a conflitution that delivered them from the sevolutionary government and its inferna! policy. Befides it had, in fpite of great defects, the merit of coming nearer than the two preceding oncs, to the principles of order, of juftice, and real libeity; the violation of which had, for five years before, been the fource of fo many difafters and fo many crimes. The royalifts, confidering it as a ftep towards monarchy, were unfortunately fo imprudent as to triumph in it; and their joy, as pre. mature as indifcrect, alarmed the affembly to fuch a degree, that they pafied the famous law, ordaining the primary affemblies to return two-thirds of the members of the convention to the legilative body, which was to fucceed that affembly. It was thus that the fpirit of the convention continued, for the firft year, to be difplayed in the two councils.
"In the year following, the bias of the puolic mind, perhaws too hatlily turned towards royalty, fhewed itfelf in the elections of the members for the new third, fo clearly as to alarm the regicides who compofed the directory, and the conventionalits, who ftill made a third of the legilative body; nor did they loie a moment in devifing means for their defence. That which appeared the fureft to them was, to publith notices of plots among the royalifts, and amex one or more denunciations, in terms fo vague as to leave room for implicatinz, when neceflary, all their adverfaries; while by the help of this impolture they procured fome fecret information, artfally fabricated, and ever eafily ubtained through threats or rewards by thofe who have at command the guillotine and the public treafure.
" This malked battery was ready to be opened be. fore the members of the new third took their feats. Thefe at firt confined themfelves to the fecuring of a conitane majority in the two councils in favour of the moderate opinions; but in a little time every itting was marked by the repeal of fome revolutionary law, or by fome decree tending to reftrain the executive authority within the limits fixed by the conatitution.
" The directory, alarmed at the abridgement of their ref ${ }^{565}$ power, and dreading atill more ferious attachs upon it, revoiution came to a refolution of no longer pollponing the blow they had been meditating againt the legifative aflemby : and they accomplifhed, in the mamer alieally related, a fifth revolution, as complete as any of thofe by which it was preceded. It differed indeed from them effentially in the ficility and promptnefs with which it was effected, althuagh the party which prewale , that is w fay, the majority of the directory, and the minority of the legilative buly, had to combat not only arainft the cumfitution, but agairst the opinion, and even agsint the indignation of the public. That moral forcs, on which the najority of the two chacils had urluckily placed all their reliance, vanilh$\theta$. in on inllant before the phyfical force of a detachreent of troups confiting of fix or feven handred men ; fo wue is is that the power of the fublic opinion, ti,

## E R A [ 206 ] F R A

 diculouny exsgraerated in thefe days, is and can be no :nore, under a firm and well ordered goverument, than a mete fancy. Men accultom themfelves too eafily to take for pustic opinion the private opinions made public by certain writers, whofe caution or audacioufne's depeade always upon the energy or feeblencfs of the firpreme authority. It is the fame thing with popular commotions: they are cafily excited under a we.l. government, which does not poffefs the wiflom to prevent or the fpirit to fuppref's them; but a vigorous, jult, and Atrict government has nothing to fear from them. The directory, compelled to withdraw the larger body of troops, which they had thought neceflary to enfure the :evolution they were meditating, dificovered, no doutt, great ability in fecuring the two councils, by appearing to dicad them: but it was chiefly to the energy of their meafures, and to the concentration and promptnefs with which they were executed, that they owed their fuccefs. Two days before, the legillative body might, without obftrution, have impeached, arrefted, and even outlawed, the majority of the directory, who were execrated by the public under the title of triumvirate ; and, if requifite, they would have been fupportef by more than 30,000 armed citizens, who, with Pichegru and Villot at their head, would foon have difperfed, and perhaps brought over, the feeble detachments of troops of the line which the directory had at their command. The legiflative body, relying too much upon its popularity, did not fulliciently confider, that the people, whofe impetuofity is commonly decifive when allowed to take advantage in attack, are always feble on the defenfive, and totally unable to withttend every allault made previous to an infurrection, for it is :Hways eafy to prevent their affembling. It was on this principle that the directory founded their operations, and the $5^{\text {th }}$ of September too well proves how jufly. That day reduced the legilative body, by the moft degrading fubjugation, to a mere difgufting caricature of national reprefentation; it invefted the directory with the moft arbitrary and tyrannic power, and retlored the fyftem of Robefpierre, under a form lefs bloody, but not lefs pernicious; for the revolutionary tribunals which that monfter had eftablifhed, were fcarcely more expeditious than the military ones of the directory. The power of arbitrary and unlimited tranfpertation is, in time, as ceffructive as the guillotine, without poffefling, like that, the adrantage of exciting a falutary horror, which, by recovering the people from the flate of ilupor and apathy, the conflant effects of terror, gives them both recollection and force to break their chains. Though, in violating the moft efiential reculations of the conftitution, the directory obtained a temporary confirmation of their power, their example pointed out to Benaparte and Sieyes the path which they purfued with infnite addrefs, and in which they accomplifled a fixth revolution."The changes which fuccceded, from the confular to the imperial and defpotic government of France, are frefl in the mind of every reader, fo that the account of them niced not be repeated.

In a country fo extenfive as that of France, it is not to ke expected that the climate flould be invarial, the fame; but it is certainly clearer and more falubrious uron the whole than that of Britain; and it is admira-
bly adapted to the cuitivation of the vine, without which France. many parts of it would perhaps continue in a nate of nature. The country prefents to the ese a level appearance in general, but feveral mountains are met with in the fouthern parts of it, fuch, for example, as Auvergne, Languedoc, Dauphiné, and Provence. Some reckon the Limoufn the molt beautiful province in France, although many parts of it befides this exhibit a charming diverfity of lills and valleys, and fome of the rivers, but the Seine in particular, often afiume a picturefque appearance. It cannot be faid that agriculture has attained to the perieation which it has done in Britain ; yet in defferent provinces the cultivation of the ground feems to keep pace with its fertility, and the hufbandmen of others difplay a degree of induftry which is deferving of commendation. As a ftriking proof of this, many mountains of the Cevennes, only remarkable for their fterility, have been rendered extremely fertile by the indefatigable exertions of induftry.

The moft remarkable rivers of France are commonly Rivers reckoned four in number, the Seine, Loire, Rhone, and the Garonne, although there are many others of inferior note. The Seine is univerfally allowed to be a beautiful river, which takes its riie in the department of Cote d'Or, and after, traverfing a country of about 250 miles in extent, falls into the Engliih channel at Havre de Grace. The fource of the Loire is in Mont Gerbier, in what was formerly called Languedoc, and after rumning about 500 miles, empties itfelf into the lea beyond Nantes. The Rhone iffes from the Glacier of Furea, and the Garonne in the vale of Arau in the Pyrenees. The inferior rivers are the Saone, Dordogne, and a number of lefler ftreams which form a junction with the Loire.

There are numerous mountains in France, but there Mourtains. are none which are of a great height. It is perhaps difputable whether we thould confider Mont Blanc among the number, but if we do fo, no other mountain in the vaft chain of the Alps can exceed it in height. Thofe of Brittany confifi chiefly if not wholly of granite, but there is nothing remarkable in their elevation. Trance is divided from Switzerland by Mont Jura; but the frincipal chain of mountains is that denominated Cevenmes, running from north to fouth, and fending out ramifications from ealt to weft. Some naturalifts are of opinion, that certain volcanic appearances may be traced among the mountains in the department, of Cantal and the Upper Loise; but the bafaltic columns of which they chielly contirl, either do not favour this conjecture, or leave the truth of it extremely problematical. The loftieft mountains in France are thofe called Monts D•Or, which conflitute the centre, of which Puy de Sanfi forms the chief elevation, its height being computed at 6300 feet above the level of the lea. This mountain is covered with perpetual fhow, from the fides of which ifiues the river Dordogne.

The Pyrenees have been known and ccicurated in hiftory fince the time of Herodotio and mas with equal propricty be confidered as belonging tither to France or Spain; although they have leen more ably and mimutely defcribed by the lamed of the former country. Shells and theletons of animal lsave been found among the Pyrerces, which noy aftord matter for ample dif culion to the admirers of nature's preduction. Marise producticr:

Nivami.

The eftablilhed religion is that of the charch of Rome, but entirely independent of the Holy fee; and the revenues of the cicrgy are not fo extenfive as to render them formidable to the prefervation of the flate. Of its political conlitution, as that is an ignis fatum whith eludes all defeription, little need be faid. The govenment at prefent is a military defpotifa, and Bonaparte, once tirlt conful, now emperor, owes his very exiteace, cither as a man or a morarch, to the nttach-
ment of the foldiery. Let him lofe that, and he is incvitably undone.

Since the revolution, it is perhaps impolible to give 573 a juft account of the firength of the French army, for both themiclves and their cnemies made it , we believe, more namerous than it really was, ahhough both parties munt have been actuated by very difierent motives. The numerous defcats which the allies experienced, rendered it necelary to feak of their antagonifs as a

## $F$ R $A \quad\left[\begin{array}{lll}209\end{array}\right] \quad F \quad R \quad A$

France. never-to-bediminithed fwarm of men, and the French no doubt gave exaggerded reports of their own actual ilrengti, in order to intimidate the allics. In the time of the odd government, the army amounted to $17=000$ infantry, 44,000 cavalty, and 11,000 artillery; and perhap's at no period of the revolution did it ever exceed 602,200 men, although it has leen often magnitied to the prodigious total of a million.

The naval force of France was once formidable even to Britain; but the decided fuperiority in this refpect has been invariab!y poffelfed by the latter country ever fince the battle of La Hogue. The combined naval Itrength of France and Spain could not refilt the impetwonty of a Britih Hect off Pralalgar, under the command of the ever memorable Lord Nelfon.

The revenue of France, during the exillence of the old government, has been ellimated at thirty millions forling, but the clear produce could not exceed eighteen millions, after the deduction of all expences. Under the prefent ufurpation, however, it is impolfible to make any eftimate of its amount, as it is often augmented in an unknown and tluctuating ratio by plundes sud ropine.

With refoect to literature, France certainiy ho:ds a diltinguithed place amung the nations of Europe; and if the palm has been adjudged to Italy and Britain by Come authors, in point of bold invention and profound pinilofophical fecculations, French authors are to be met with in great abundance who have done honour to haman nature by their polite learning, and elegant as well as uteful fcience. Altogether independent of a Comeille, a Racine, a Crebillon, a Moliere, or a Volthire, this country has, at a more modern period, produced many ditinguilled writers in literature and philofor hy, whofe productions will continue to be read and admired, fo long as men retain a fenfe of the value and impurtance of the fciences they refpectively illuftrate.

At one period there were no fewer than 21 univerftice in France, of which the Sorbonne at Paris was reputed the molt celebrated, the fame of which drew numbers of itudents from ditant countries. There were about 39 academies and literary focicties, thich produced many elegant and valuable difertations on the different fcience, which have been long hnown to, and juftly efteemed by, the leamed world.
cities, zic. of them make a molt condpicuous fgure. Par:く, which is fill the metropolis, has been fumetimes reckoned a third fmaller than London, and its population itated at 600,500 fouls. It has often been contidered as fuperior to London in point of magnificence, but it is unduabted. iy inferior, both in regard to convenience and cleanlinefs, the fireets in general having very poor accommocations for paffengers on foot ;-a defect for which mo elegarce or maknificence can fully compenfate. The nicit to Pari in importance, is the city of Lyom, the population of which is computed at $1 \subset \supset, 0>0$; but the defolation which it fuffered during the tremendous reisn of Jacobin tury it will perhaps never recuver, as the atolition of monarcliy was the innocent caule of the ruin of its trade, which conffted chictly in the manufacture of fuch fplendid articles as were confumed by the court.

Next to Lyons we may mention Marfeilles and BourVol, IX. Part I.
deaus, each of which are computed to contan at F . $8:, 000$ people ; and the pert of the furner city is per- $-\infty$ haps the bell, an well as the molt frequented, of any ia the Mediterrancan. Liile and Vatenemos are both Ifrongly fortified, itice, the fermer of which has a poru. lation of about $62,-\%$. It Surrendered (1) thie come bined powers in the year 179:, but the Freath re toole it in the following your. The romaining cive, of which we can only gise a bare caumeration, sa, Amiens, Rouen, Brell, Nintes, Otlemb, Xmey, X / a Strabourg, Touloufe, Nontpelier, \&ic. none of th:on having a population under $3=, 000$ fouls, many of ti.ran carrying on an exterfive tiade, and all of them ahousd. ing with elegant buildings.

There are feveral public cdifices in France, whis command the admiration of every beholder, fuch as the palace of Verfailles, the beautiful and magnifen: bridge of Neuille, and the ancient cathedrals and calles, of which there are prodigious numbers. The bridge of Neuillé indeed has been rechoned fareris to any in Europe.

Many exertions have been made at different period, Cand? to improve the inland navigation of France. The great Henry IT. began the celebrated cans of Burguidy, which was finilhed by Louis XIII. and be which a con.munication is opened between the rivers Loire and Seine. It confilts of +2 locks, and is of fingular importance to the commerce of the weftern provinces. The canal of Picardy reaches from the river Somme to the Gife, taking its rife from St Quintin, and affording an intercourte to the prosinces lying on the noth-eaft. But the: greateit and mott expenive work of this nature in France, which was begun and finithed by Louis XIV. is the canal of Langwidoc, which was cumpleted in r ; years. It is $1+4$ feet broad, in feet deep, and about ise miles long, and it cott upwards of half a million iterling.

The total amount of the exports of France in the $\mathrm{T}_{5}^{55_{r}}$ year 1784 , exclufive of the prownees of Lorraine and Alface, and the trade with the Weft Indies which has been fince carried un, was $307,151.700$ livres, and her imports $271,365,000$, leaving a balunce of $35,796,7=0$ livres, which amount to $1,565,668$. Alerling. Britith commerce has been on the increafe ever lince the commencement of the revolution, while it may be julty faid that the trade of France has been proportiona!$y$ on the decline, although we cannot afiert with a certain geographer, that it has been " almolt anmihilated."

I/le of FRANCA, a late province of France, but now divided into five departments, and to called, becaule it was formerly bounded by the rivers Scine, Marne, Oif, Aifne, and Ourque. It comprehend berides Paris, the Beausoifs, the Valuis, the county of Semlic, the Vexin, the Hurepois, the Gatinois, the Nubtien, the Guck, and the Mantois. Paris is the capitat.

FRANCFOR $\Gamma$ onthe MAINE, an imperial and hanleatic town of Franconia in Germany, where tlie emperors were formerly clected. It is a handfome, ftrong, and rich place, and has a great deal of commerce. Here the golden bull is prefersed, which is the original of the fundamental laws of the empire. It is feated in a fine fertile plain; and well fortified with a dunble ditcb, baitions, redoubts, and ravelins. The At.ects are remarkably wide, and the houfes handfomely built. D d

Wat it in weat conve: iency for carrying on an extenfive ttade with the other yarts of Germany, by means of the watione siver which runs throughuat it. It was taken in Oetojer 1792, by the French, who were dit polefed of it by the Paflams in December fullowing : It was again taken by the French in July 1 -90. but the evacuated it to the Aultrians in September fo lowing. ihe faburb is calld somon-hay in, and juined to the towa ty a thone bringe built over the Risine.  $\because$ Germany, in tie midale marche of Brande etourgh, formerly impering, but now falject to the hing of Prutia. It is remarkas? for thrie creat fairs, and a celontated univering. It lies about +5 wiles louth eat of Batim, and $i^{2}$ fouth of Stetin. E. Long. $1+39$. IN Let. 52. 23 .

IR-iNCHE-compte, a late province of France, Duched on the fouth and well by Ch umpagne and Barquady; on the north by Lorain; and to the eaii by the carldom of Mumplegard, and S witzerland. It is in mon thom north to fouth ato.t 3 olearues: in breadth a ont 20. It is partly fat and party tan'. The that conaty is fruitul in grain, wine, hemp, and pattare; and the hilly comery abound, in cattle, producing allo iome wine and corn, coppar, lead, hon, and fiver ores, mineral watere, at d quarries of itone, marble, . nd alabater. It now furm the three deparments of Doub- Jura, and Upper Sione.
TR-iNCHISE, in La*: Fiancl:⿳ and liberty are ide to fynonmous terms: and their definition is, "a an ! privilcge, or branch of the hins's prerogative, theines in the hands of a fuye:". Being th retore amtived from the crown, they mut anice from the king's 4. : or in fome cates, may be held by prificiption,
liik. as ha been frequenty find, preinipoes a pramt. The Linds of them are various, and almot infuite. We thall here bricly wow upon fome of the principal; forming only, that they may be weited in cither natural pertum or bedies politic; in one man, or in many : b.t the fame i.jentical franchife, that has seve been gram:ad to one, cannot be belowed on another, for that would sciudice the former grant.

To be a county palatine, is a fraccinite velied in a nomber of perfons. It i Whewife a franchife fo: a number of perfons to be incurforated and fubfift as a budy politic ; with a power to naintain perpetual thecelfion, and do other corpoate acts: and each indivi$\therefore$ abl itember of fuch compation is alfo faid to have a Sranclite or freedom. Other franchifes are, to huld a court leet; to have a maner or londhip; or, at leat, to have a lordhip paramount: to lave waifs, wrecks, eltay, trenare-troce, royal fhl, forfectures, and desdans: to have a court of one' ow, or liberty of huldang pleas atd trying canks. So have the cogmi. ze co of tean; which is a thll greater liberty, being a coclufive right. to that no wher court thall try colfe arimg whim thit juridition: to have a bailiwich, or Bubey excmpt trom the theriff of the county; wheri the tratce only, and his otlicers, are to cycure all proces: to have a fair or market; with the ri the this toll, ether there or at any oher muihic fincec, as at bridgic, wharfe, or the like; which tuli man have a reafonatle emfe of commencemont (as in comefration of repairs, of the like), whe
the franchie is illegal and void: or latty, to have a Franchife foreh, chate, pul, warren, or filhery, endowed with privileges of rogaty. See Chase, Forest, \&c.

Frincurse is ats ufe! for an afflum or fanctuary, where people are fecure of their perions, \&c. Churches an l munteries in Som are franchifes for criminals; to were they anciently in Enghan, till they were abuled is fuch a degree that there was aneceflity for abolithiny the cutum. One of the mont remarhable capitukhars made oy Climlemagne in his palace of Herital, in 779 , was that relating to the franchifes of churche: The right of franchite was held to lacred, that even the let, religous hings oberved it to a degree of fernpuloufiefs: ut to fuch excels in time was it carried, that Clarlemagne refolved to reduce it. Accordingly he forbade any provinon being carried to criminals retired into churches for refagt.
$I_{\text {Rinchise }}$ 录arters, is a certain face or diltriat at Rome, wherein are the hou'es of the ambatalars of the princes of Europe; and where fuch as retire camot be arrelled or feized by the birri or ferieants, nur profecuted at law. The people of Rome lnok' on this as an o! dineation ..... a romatur privie.e, which ambafidors, out of a jealouly of their poser, carried to a great length in the $\mathrm{I}^{\text {th }}$ th centary, by enlarging infentbly the dependencies of their palaces or houfes, within which the right of franchife was anciently confined. Several of the popes, Julius III. Pias XIV. Gregory XIII. and Sistus, V. publified bulls and ordinances againt this abule; which had relicued fo contiderable a part of the city from their authority, and rendered it a retreat for the mont abandoned perfons. At length Imocent XI. exprefity refued to receive any more amburdors but fuch as would make a formal renunciation of the feanchife of quarter.

FRANCIS I. King of France, the rival of the emperor Charies V. and the whorer of learning and politeneft in France. See (Hilisoy of) Frasce:

Fravis, Philip, a very ingenious writer, of Irih evtraction, if no born in that kingdom. His father was a digmined clergsman in Irelind, being dean of fome cathedr.1: and our author, his fon, was allo bred to the church, and had a doctor's degiee conterred on him. He was more ditinguilhed is a tranflato: than as an original writer. His verrions of Horace and Demothenes lave been juitly vatued: the forncer is accompanied with notec, and is perhaps as complete nod wfetul a work of its kind as hath yet appeared. He was ahio a confiderahe political writer; and in the beginning of the prefent reign is fuppofed to have Len emploved $y$ the government : for which fersice he was promoted to the rectory of Barow in S ufolk, and to the chaplamithip of Chellea hofyital. He was alfo the author of two tragelice, Eugmia and Conftantia; but, as a dramatic writer, not very fucce sful. He died at Bath in Morrh $57 /$ : ; leaving aton, who was then one of the tupreme council at Bengal.
FRANCISCANS, in E ciffical Horl, are rehisious of the order of St Franci, fousdal by wim in the year 1 zeg. Fraucis was the fon of a merchan: of Affif, in the province of Umbri. who, having led a difitute life, was reclaimed by a fit of :irkne's, ..nd afterwards fell into an catravagant kind of derotum,
ran bues.that looked le's like religion than aifenation of mind. Soon aftor thi, wiz. in the year $1: 23$, hearing the pulinge repeated, Mitt. x. 9.10 in which Chrit atArche hiv apolle, Pruvide newiter suld, nor fale", 心. le wis lad to conti'er a voluntary and abivlute poventy os the efllace of the goipel, and th precribe thin no. ocrty as a hacred rule both to himelf and to the fow :hre followed him. This ness locity, which appeared

Innucent III. extremely adapted to the prefent date of the chureh, and proper to rellore it, declining credit, wia fulmanly approved and confimad by Honorias 111. in 1223, and had made confiderable progreli before the death of its founder in 122 . Foncis, throurt an cxcelive humility, would not fuffer the monh of his onder to be called foutre, i. e. brethen or fiam, hut finaticult, i. c. little brethren, or friar-minor, by which denomination they fial continue to be difinguinat. They are alfo catied gray friors, on account of the colour of their clothing, and cordetiers, \&ic. The Fancilcats and Dominicans were zealous and autive friends to the papal hieratchy, and, in return, were ditinguinhed by peculiar privilegen and honourable emplovments. The Franciicans, in particular, were invelted with the treaure of ample and extenfive indulgences; the ditribution of which was committed to them by the popes, as a means of fubfitence, and a rich indemnification for incir whuntary poverty. In conlequence of this grant, the rule of the founder, which abfoutely prohibited both perimal and collective property, fo that neither the individual nor the community were to pofiefs cither fund, revenue, or any worldy goods, was confidered as too ilrict and fevere, and difpenfed with foon aficr his death. In 1231, Grezory IX. publifhed an interpretation of this ruie, mitigating its rigour ; which was farther confirmed by Inncent 1V. in 1245 , and by Ale ander IV. in $12+4$. Theie miller operations ware zealouly oppofed ty a Eranch of the Francilcans called the prictual; and their complaints were regarded by Nicholas III. who, in $12 \% 9$, pubibied a fanous contitution, confirming the rule of St Francis, and containing an eaburate explication of the navim: it recommended, and the duties it preferibed. In $: 25_{7}$, Mathew of Aqua Sparta, being eleited general of the order, difourased the ancient difcipline of the Francifcans, and indulged his monks in abadoning even the arpearance of poverty; and this condua inflamed the indinnation of the firitual or aufterer Franciicans; fo that from the year 129? feditions and whifms arofe in an onder that had been fo famous fur its pettended difintercticdief, and humility. Such was the enthufatic frenzy of the francifant, that they impiouly maintained, that the foumer of their order was a fecond Chrilt, in all relpects fimilar to the firft; and that their inditution and licipline were the true gotpel of Jefun. Accordingly, Ahizi, : Francifan of 1 pifa, promhed a Look in $1 ; 83$, with the applanie of his order, entited, The book of the Conformite, of S: Franci with defa Carit. I: the beginning of this centary, the whule Franican ordir we divited into two parties; the une, embacing the ievere cfici,line and ablolue poverty of st Fame, "ere" call: 1 firitituals; and the chere, who inniod

Tranconia tity of otter kins far exceeded any thing which Pey1 roufe had obticued in any other part of America.

The climate of this coall, according to Peyroufe, fecmed much milder than that of Hudfon's Bay. For three or four months of the year vegetation was sery vigorous; there was found abundance of clery, endive, lupin, and yarrow, with mott of the plants which ase common in the meadows and mountains of France. Goofcberries, rafpberries, and itrawherrics, were alfo common in the woods; poplars, nillows, hornbeam, and pincs, fome of which meefured fis fect in diameter, and 1 qo feet high, fit for matis of the largeth hips. The river feemed to be filled with trost and falmon, and different hinds of filh were found in the bay itfelf. The variety of birds was not great ; but bears, martens, and fquirrels, were frequent in the woods. The inhabitants are faid to be condiderably dilarent from the Californians, being taller, flouter, of a more agreeable ficure, laving greate: vivacity of expreflion, and a greater thate of courage and fent. Thei: colour is olive, and the hair in general is neither to coaric nor blak a that of the South Ariericans. It is fuppoled that they are norlippers of the fun, for they were frequent!y obferved addrefing themielves in their prayers to this planet; but neither temple nor prieft, nor trace of public worhip, was feen. It is faid that they burn their dead.

FRANCONIA, a circle of Germany, bounded on the north by the circle of Upper Saxony, on the eall by that of Bavaria, on the fouth by that of Swabia, and on the welt by the circles of the Rhise. The middle is fertile in corn, wine, and fruit,, but the borders are full of woods and barren moentains.

This country was overrun by the French republicans in the fummer of 1796 ; but in September the Aultrians compelled them to retreat. The Franks, who conquered France, came from this province, and gave their name to this hingdom.

FRANGULA. See Rhavins, Botiny Indor.
IRANK ingutagr, Lingua Franca, a hind of fargon fooken on the Mediterranean, and particularly ihroughout the coalls of and ports of the Levant, compofed of Italian, Spanith, French, vulgar Greck, and cther languages.

Frank, or Franc, an ancient coin, either of gold or filver, flruck and current in France. The value of the gold franc was fomething more than that of the gold crown: this coin has been long ont of ufe, though the term is fill retained as the name of a monev of account ; in which fenfe it is equivalent to the livere, or 20 fols.

Frank, or Franc, meaning literally froc Irom charges and impofitions, or exempt from public taxes, bas varivas fignifications in the ancimt Englih cuffor:s.

Fpank-Ainnigne, (htwer: d/comofina), or ". free alms;" a tenare of a fqritual nature, whereby a religiow corporation, aggrezate or fulc, holdeth lands of tic donor to the:n and their fucceflors for ever. The fervice which they were hound to render for thefe thade was not cert tisly defined: but only in general to pray for the fouls of the doan and his heirs, dead or slive; and therefore they did no fealty (which is insident to ail other fervices but this), becaule this divine ferviee was of a higher and marre eadted mature. 'This in the terare ty which andoll ail the achent momat.
teries and religious houfes held their lands; and by which the parochial clergy, and very many ecelefattical and eleemolynary foundations, hold them at this day; the nature of the fervice being upon the Reformation altered, and made conformable to the purer doctrines of the church of England. It was an old Savon tenure; and continued under the Noman revolution, through the great refpect that was thown to religion and religious men in ancient times. This is alfo the realon that tenants in frank almoigne were difcharged of all oher fervices except the trinoda neceffitas, of repaising the highways, building cafle,, and repelling invafrons; juil as the Druids, among the ancient Britons had omnium rerum immunitatem. And even at prefent, this is a tenure of a very different nature fiom all others; being not in the leaft feodal, but merely fyiritual. For, if the fervice be neglected, the law gives no remedy by dittrefs, or otherwile, to the lord of whom the lands are holden; but merely a complaint to the ordinary or vifitor to correct it.
$F_{\text {R.ink-Chafe }}$ is defined to be a liberty of frec chafe. whereby perfons that have lands within the compals of the fanie, are prohibited to cut down any wood, \&c. out of the view of the forefter.

FkAnK-Fu, fignifies the fame thing as holding lands and tenements in fee-fimple; that is to any perton and his heirs, and not by fuch fervice as is required by ancient demefne, but is pleaded at common law. See Fee.
Frank-Law, a word applied to the free and common law of the land, or the beriefit a perfon has by it.

He that for any offence lofeth this frank-law incurs thefe inconveniences, viz. He may not be permited to ferse on juries, nor ufed as an evidence to the truth; and if he has any thing to do in the king" court, he muft not approach it in perfon, but appoiit his attorney; his lands, goods, and chattels, thall be feized into the hing's hands; ard his lands be ettreated, his trees rooted up, and his body committed io cutiody.

Frank-Marriage, in Law, is where tencments are given by one man to another, together with a wit, who is the daughter or coufin to the donor, to hold in frank-marriage. By fuch gift, though nothing but the word frank-marriage is exprefied, the donees hall have the tenement to them, and the heirs of their two bodies begotten; that is, they are tenants in fpecial tail. For this one word, frank-marriage, denotes, ex e termini, not ouly an inheritance, like the word frankalmogue, but likewife limits that inheritance; fupplying, not only words of defcent, but of procreation alfo. Such donces in frank-marriage are liable to no fervice but fealty: for a rent referved therein is void uatil the fourth degree of confanguinity be paft betwecn the ihues of the donor and donce.
$F_{\text {KANK-Plut }}$, in $I . a:$, figniifies a pledge or furety for the behaviour of freemen.

According to the ancient cullom of England, for the prefervation of the public peace, every freeborn man, at the age of fourteen, except religious perfons, clerks, hnights, and their eldefl fons, was obliged to give ticurity for his trath and behaviour towards the king and his tu'jests, or elfe be imprifoned. Accordingly, it cortial nuaber of neighbours became interchangeably

FRANKED 1.t.1 ERG. The privilege of letters coming free of follage to and from mom'ers of parItament was chamed by the honte of commons in 1660 , whe: the firit legal Cettlement of the prefent pot oflice V'ds made; but aftermards droped, upon a private alurance from the crown, that this privilege fhould be atiowed the member: And accurdingly a warrant was conaatly ifued to the pollmatter general, directing the alowance thereof to the extent of two onnces in weight: till at lemgth it was exprefity contimed by \& Geo. IIl. c. 24. which adds many new regulations, rende:ed necemary by the great abufes which had crept into the practice of franking; whereby the annual amount of fankei letters had increafed from 23,6001. in the year 1715 , to 177.7001 . in the year 1763 . Further regulations have fince tahen place; in particular, fra:ins mutt be dated the month virtten at length), and put into the oflice the fame day ; notwithfianding which, the revenue tiall lofes by this privilege a very confiderable amual revenue.

FR.ANKEN, Franoisets, commonly called Old Frank, a famous Flemih painter, fuppofed to have bea born about the year $15+4$; but though his works are well known, very few of the circumflances of his life have been tranfmittel to polterity. This matter painted hittorical fubject, from the Old and New Teftaments; and was remarkable for introducing a great number of figures into his compofitions, which he had the adhets to group very ditinctly. Vandyck often commended his works, and thought them worthy of a flace in any colle tion.

Friviex, Fiomefers, ditinguithed by the name of 2 wns Frank, was the fon of the former, born in the year 1580 . He uas infructed by his father; whofe $I^{t}$ yic lie adopted fo ciofely, that their works are frequently mistaker. When he found limelf futiciently ihilled at home, he travelled into Italy for improvement in colouring; and, on his return, his works were rimel coveted. The molt capital performances of this painter are, a Ceriptural performance in the church of Notre Dame at Aitwerp; and an evcellent picture, in a fimall fize, of Sulomon's idolatry. Soung Frank died i) $16+2$.

FRANKEND AL, a ftrong town of Germany, in the dominions of the Elector Palatine, fituated near the Rhine, about feven miles fouth of Worms. It nas taken by the Spaniards in 1623 , by the Swedes in 1632 , burnt by the French in 1688, and finally taken by the allics in the year 1794. E. Long. 8. 29 . N. Lat. +9. $2 \%$

IRANENIA; a genus of plants belonging to the levandria clat; and in the natural method ramking under the $1^{\text {th }}$ th order, Calycanhthue. See Botany Indix.

IRANKFORT, the name of feveral townhips in different places of North America; fuch as Frankfurt, a townl. $i_{2}$ in Hancoch, and ditrict of Mainc, with a few
bumes regularly buil. It contains sot inhathitante, $\mathrm{r}_{\mathrm{ra}}$. in and iis atout 238 mice nothent of Buton. Frark- cone. font, a thrivins village in Phitapha; the :anme of Prate another in Ifamphire, of one in Virginin, and the name of the metropoli of Kentury.

FRANKLIN, 'innos, 1). 1). chaph in in ordinery to his majefty, was bran in london about the year 1720, and was the fon of Kichard Frambin, well known as the printer of an anti-miniteral proper called The Croffinan; in conducting which he rer ccived grant affitance from Lerd belingbruhe, Mr Pulteney, and other excellent writers, who then oppofed Sir Robert Walpole's meafures. Ey the advice of the fecond of thefe gentlemen, soung lranklin was devoted to the church, with a promife of being provided for by the patriot; who afterwards forgot his undertaking, and then entirely neglected him. Hu was educated at Wettmintter fchool; from whence be went to the univerfity of Cambridge, where he becane fellow of Trinity college, and was fome tine Greek profeffor. In December $17 ; 8$, he was intfituted vicar of Ware and Thundridge; which, with the lecturehip of St Paul, Covent Garden, and a chape! in Queen flrcet, were all the preferments he held till he obtained the rectory of Bralled in Kent. This gentloman was poffeffed of no inconfideratle thare of learning and poetical abilities, and was long a favourite in the literary world. His tranlations of Phalareus, Sophocles, and Lucian, equally evince his learning and his genius, as they are not more dilinguiked for fidelity in the verfion, than congeniality with the firit of the admirable originals. Dr Franklin, Like Mr Foote, fuffered a tranlation from the French to be printed in his name ; but the Orelles and Electra are fuppofed to be all that were really by him. It was a tranllation of Coltaire's worls, to which alfo Dr Smol. lett's name appears. His onn dramatic compofition, of which the principal are the tragedies of The Earl of Warwick and Matilda, are univerfal!y known, and defervedly efteemed by the public. He died in Matcl: ${ }^{1} 7^{8}+$.

FrankliN, Benjamin, a plidofopher and a taide man of confiderable eminence, was born in the yeas 1706, at Boton in New England. His family derived their origin from Ecton in Northamptonllire, whes his anceffors had an irconfiderable fiechold tor man: generations. The perfecution of the no:conturnits it the reign of Cbarles If. induced his fither to tabe refuge in New England; and in the city of Pollon he followed the occupation of a foap-builer and t.tllow chandler. Franklia drew up a hitory of his own lisifrom his nativity to the 25 th year of his age; but as i. that period he had made no very confpicuoun figute in the world, it is to be lamented that we have not the dififtance of his own pen to the meridian of his catcer. This defect we have endeavouted to fupply in the fubtequent narrative from the moit authentic mas terials, avoiding as much as pollible the exaskerated pancesyric of friends, and the unmerited detraction of enemies.

Our author, from his very iafancy, difoovered shis ftrongell propenfity towards literary urlaits, which ds termined his father to qualify him for the minilley ; but he was thwarted in bis defigns by a mumerous and inereanin.

## F R A [ 214 ] F R A

...the tumly, and herefore Benjamin wa taken fiom fohool at ten years of ase, to take part in the drulge:y of his fither's thide. This greatly mortined the alpirin; mind of youg Fromblit, who wihed to prefer a feameng life to fuch an employment; but from this he wis diffended by the imluence of his father, who was a man of tome knowledge, and pollifed a folid undertanding. He made it his chief aim to dilipire tio chidren with the love of kaowletge and the principles of moral rectitude. He had few bohbs; yet from anong thete Eenitmin felected a number of voyages and tratel, as walt as different hitorice, a fecies of reading for which he had a flrong predilection. By going thevech a courle of controvertial divinity in this unaided manmer, ne greatly Arengthened his argumentative powers, "hich was moft probabiy all he had in siew. Defoe upon proiects, according to his own account, made fath impreftions upon his mind as in a great mealure directed the fubfequent events of his life.
He was now chofen to an employment w!ich acc ardei much better with the natural bent of his mind than the butinefs of his father's thop. A brother of his own had a printing-otice in Botton, to whom Benjamin was bound apprentice at 12 years of age. With the mechnnical part of the bumnefs he was foon acquainted; and the opportunities thus afforded him of procuring new books to rend, wore eagerty feized, and the greater part of the night frequently fpent in the perashl of them. He foon became anxious to initate the works which he molt adnired, and his firlt attempts were of a poetical nature. He compofed and printed ballade, which were well received by thofe who love che a fpecies of reading; yet his father had the addrefs to convince him that nature never defigned him for a poet. He therefore turned his whole attention to the cultivation of profe compolition, in which he fucceeded infinitely better; and he thus became fuperior to his brethren of the prefs, and raifed himfelf to flations of pu'lic importance. As his paffion for reading and writing was very ftrong, fo he became in a thort time a powerful difputant, which was itrengthened by his intimacy with a young man of a fimilar difpofition. He peruled, with uncommon attention, a traylation of Xenophon's Memorabilia, which enabled him either to confute or contound an adverfary by a number of queftions. It is allo certuin that he became a feeptic as to the religion in which he had been educated, and propagated his unbelief with zeal and affiduity. The fatal confequences which this produced on the deportment of fome of his intimate companions, at length happily convinced him that it is extremely dangerous to deltroy the falutary influence of religion, without being able to fublitute any thing in its place of equal importance and etficaey. He feems, however, to have continued a lceptic in his own mind, yet he fill retrined a love for moral rectitude, which led him to adont honourable means in the profecution of valuable ends. Much to his horour be it fpoken, he acquired, at a very early period of life, that trinmph over his fenfual apetite, which is fo eflentially necellary to a life of dignity, ufeEulnef, and virtue. Having read Tyron's recommendation of a veget thle diet, at 16 years of age, he abandoned the ufe of animal food; and on offering to his brother to fupport himilelf on half the money which was paid for bis baard, he was allowed to adopt his owa
plan, by which means be was enabled to fave a coni- Franklin. derable fum tor the purctafe of bouks. Atthough he -rrelaxed confiderably as to a vegerable ditt, yet he thus acquired the habit of being fatistied with little, and a contempt of the gratifications of the palate was froqumtly of tingular advantage to him through the whole of hice.

When his brother began a nows-paper, Benimiat fent a num er of pieces on tarious topics to be inkerted, which met with the approbation of the moll competent juder ;-- Iatisfaction lie erjoyen without being kiown, as the ", were all anonymons. His brother teated him ith the harknefs of a matter, which he bore with the uthal inpatience, as the public had alrealy pronounced hin to be poffifiled of merit. The flatey of America having prolitited James Franklin from pubititing this paoer, on account of fome political offerce, the name of Beugamin was emploved as publiher, in conlentence ot which he procured his indentures, althous he agreed privately with his brother to ferre oat his time. But as he did not deem this agreement obligatory, he went to Nery York by fca, and from that phace to Philadel. phia, in the fevententh year of his age. He bimfelf achnowe.dges this to have been a fault, and therefore has averted that cenfure which he would utherwife have deferved. At Philadelphia he engaged with a printer of the name of Kimer, whofe aflairs he foon placed on a more retpeatable footing; and bere allo he became acquainted with feveral young men of a literary turn of mind, by whofe company his tatie for knowledge was greatly improved.

He foon after became acquainted with Sir William Keith the governor of that province, who powerfuliy recommended it to him to commence bufinefs on his own account, and promifed to give him all the encourayement in his power. Encouraged by this gentleman to adopt fuch a plan, he fet out for Botlon on a vilit to his parents, in oider to procure from them fome pecuniary aid ; but a welcome reception was all he could obtain. Having returned to Philadelphia, Sir William gencroully offered to take the whole burden upon himfelf, and advifed Framhlin to make a voyage to England, in order to procure cerery thing necentary for a printiny-ofice. He let fill in the year 1725 , and took with him his intimate companivi Ralph, whofe name has been readered memorable by being celetrated in the Dunciad. Unfortunately for Franklin, Sir William Keith, on whofe letters of recommendation and credit he entirely relied, bately deceived him, and he was ohliged to work as a journeyman in London for his immediate fultinence. His friend Rolyh could only live by his head, and his income of confequence was ertremely circumfcribed, as well as precarious, which made him a be wy hurden on the pocket of B njamin. In that difiolute metrotolis the one forgot his wife and child in America, and the other the tolenn promites of fidelity which be had made to a Mifs Read, prior to his depaiture ;-another ftep of his conduct which he himferf feverely cenfurcs. By a difertation on liberty and necetfity, pleafure and pais, he acpuirel confiderable reputation, and it was the mears of introfucing him to the relcmated Dr Minderillc, author of the Fahle of the Becs. In the fecond priating-oifice in which he worked, he laboured incelmaty to convince his fellow woikmen that a piist of poster does not contain

Frakin holf fo much nourithment as a penny rult, $f$ o whint he ontaned the hadicrom epithet of the $A$ mas.aon a was ; yet he was finally ematicel to make meny concth on

 of the with whom he had to treat to their farmate I:bation.

Ater eiphteen months reidence in Lenton, he returned to Phinadelphia in the sear 1726 , and became clerk to a Mr Denham, a man of retuetabioty, who had opened a warehoufe in that city. He fon bec mo actuaimed with the principles of commerce, and led at very hapy life in this new fituation, till the comection vai difiuled by the death of Mr Denham, which happened the followias year. This a an oblicel him to become journemmat printer, and he was aftmonth oveficer in the o ic: of kemer, whom we have alrealy mentioned. Hyre he acpuived great elleem, and it leneth conceived the ide of fetting up for 1 imfilf, which he accon libed by entering into partuewhip, with one Mereinh, a fullow workman, whole father was in circambances to enable him to advance them fome money. His indentry was habitual, bat the illea that he wa now wotion for himfelf, gave it addetonal enereg. He vas chic.'y in rumental in the inflimutur of a ciub whirla went br the name of the junt, and which was hisifis condarie to the intelicetual improvement of it inembers. Pa bere the admilion ot a randid:te, the folloung quetion were pet to him. - Do you thocere! y declere that sou love mandind in general, of whas profilion ore relifion foever: Do sou think any perion ought to be homed in his body, name, or gost, for mere peculatise opinims, or his "Sernal wy of womip; Do you lose truth for trath's fake; and will you endeasor impartially to find and receive it yomidi, and communcate it to others ", Frasitin shd his comartner: becan a wertiper, which the lagour and talmts of the former Crought into re ate, whl by them the roter and law of the a cm . biy came atirnards to be printed. The partherfrion being durived by the damorture of Merdith, Prank, in, by the gencrous aid of friend, was etabibed to tahe the whole buinels upon himfit, to which be adied the buhuefs of a thaioner. When the increale of pa er money comad the attention of the American goverment, Frathin wote in anonymous pamblet in deferce of the meafure, by which he acquired confideable reputation, the countenance of man in power, and it placd hin profectity on a permanent bais. $\underbrace{F}$ rather. effich of lightning, which are truly alarming in North America. He applied phyfics to the purpofes of common life, and in 1745 invented his Pennfylvania fireplaces, in which the qualities of an open grate were combined with that of a fove.

He turned his attention very much to the fubject of politics, which was extremely natural for a man of a public fpirit living under a popular government. He was chofen a reprefentative of the city of Philadelphia for the provincial aflembly in $17+7$. At this time a conteft fubfited between the affembly and the proprictarics, as to the claim of the latter to be exempted from public burdens. Franklin took the popular fide of the queition, by which he acquired great influence, and was regarded as the head of the oppofition. This was not the offspring of eloquence, for he teldom fpoke, and never in the form of an harangue; but his pointed obfervations, his unadorned good fenfe, frequently deflroved the effect of the molt elaborate orations.

He drew up the plan of an academy to be founded at Philadelphia, from a conviction that education in a free ilate is of the utmolt importance. It was carried into effeet in the year $175^{\circ}$, by virtue of a fubfeription, to which the proprietors afterwards liberally contributed. He difcharged the duties of his office as pottmafter of Philadelphia with fo much punctuality, that he was appointed deputy poftmafter general for the Britilh colonies in 1753 , and the revanue was foon bettered by his unwearied exertions. A plan for conciliating the Indians, and forming an alliance with them, was drawn up by Franklin in 1754 , to which the commiffoners at Albany agreed, and a copy of it was trandmitted to the Britith prisy council. It is a fingular circumftance, that this plan was rejected by the affemblies as giving too much power to the crown, while the Britilh miniffry declared that it gave too much influence to the reprefentatives of the people. In the year 1757, Franklin fet fail for London, as agent for Pennfylvanis, the affembly of that province being involved in difputes with the proprictary. It was agreed on by the privy council, that landholders thould pay their thare of the public burdens, on condition Franklin would engage that they thould be fairly proportioned. He continued at the Britifl court as agent for his province, and acquired fo great reputation, that the fame truft was repofed in him for Maflachuffets, Maryland, and Georgia. His merit as a philofopher was now jultly appreciated in Europe, and he was made a fellow of the Royal Society of London. The degree of L. L. D. was alfo conferred upon him at St Andrews, Edinburgh, and Oxford.

In the year 1,62 he returned to America, where he received the thanks of the affembly of Pennfylvania, and a handfome recompenfe in money for his important fervices. When the itamp act occafioned fo much difturbance in America, Dr Franklin was fummoned to the bar of the houle of commons, to give evidence refpecting the difpolitions of the people, whether he thought they could be induced to fubmit to it; and the energy and clearnef of his reprefentations were inftrumental in procuring the repeal of that obnoxions meafure.

On the commencement of holilities between Great Britain and the colonies in $\mathbf{1 7 7 5}$, he returned to America, and was chofen a delegate to congrefs by the leeilature of Pennlylvania. In 1776 he treated with

Lord Howe on the fubject of a reconciliation, and in one of h.. titers exprefied in itrong terms the temper of the B:i: in nation, to which he imputed the fatal extrenity then arrived. When the quertion of independence came to be difcuffed, he was decidedly in favour of the meafure, and wos lighly intrumestal in bringing over the putlic mind to the fame opinion. When a negotiation with France was opened, Dr Fianklin was chofen one of the perfonages to refide at that court. His political abilities eminently qualified him for fuch a fation, and his character as a philofopher gained him great eftecm in a country where knowledge is revered. He trought about a treaty with France of an ofiendive and defentive nature in 1778 , the immediate confequence of which was a war with Britain. He was one of thofe who digned the provifional treaty the year following. Prior to his leaving Europe he concluded a treaty with Sweden and Prufia. He was recalled from that active ftation in 1785 , which he had filled with fo much ability, and chofen pretident of the fupreme executive council. He was chofen prefident of 2 fociety for alleviating the miferies of prions, and abolifhing llavery. His increafing infirmities made him withdraw from all public bufinels in 1783 ; and on April the 17th 1790, he terminated his active and wieful life, in the 85 th year of his age.

Perhaps no man ever exceeded Dr Franklin in that folid practical wifdom which confitts in purfining valuable ends by the molt appropriate means. His cool temper and found judgement fecured him from erroneous expectations. He faw things in their true light, and predicted comfequences with nearly a prophetic fpirit. He faid of himfelf " I have always fet a greater value on the character of a doer of good, than any other kind of reputation", In 17.9 , his "Political, Mifcellancous, and Philofophical picces," were publihed in to and $8 v o$. His effays, humorous, moral, and literary, were publiked after his death, in two fmall volumes.

He was by no means inattentive to his own intereft, of which his rapid advancement in life furnifhes an ample proof; yet he never neglected the interelt of focicty, or the good of mankind in general. The delicate fituations in which he frequently itood, unavoidably expofed him to the cenfure of his enemies; yet his general conduct has long ago received the approbation of his countrymen, by whom he was confidered as the beft and moft valuable of citizens. When we view him as a philofopher, we mult afcribe his chief merit to his electrical difcoveries, yet on many other topics, fuch as meteorology and mechanies, he evinced himfelf a man of confiderable penetration. As a political writer, his great merit is clearnefs, energy, and timplicity ; and as a mifcellaneous author he poffefles a fund of humour which eannot fail to be at once both entertaining and impreflive.

Frasklis, the name of feveral counties in America, fuch as Franklin county in Pennfylvania, computed to contain 800 fquare miles, or 512,000 acres. It contains 11 townhips, and $t 5,655$ inhabitants. Franklin, a county in Kentucky; the name of one in Halifax, of one in Virginia, and of another in Georgia, which contains $104^{1}$ inhabitants, including $1 ; 6$ flaves. It is alfo the name of a townfhip in Maffachufetts; of one in Pennfylvania, another in New York, and of another in

iratricia. whe autere part of the Francifans twas confidered as honourable. Sce Franciscans.

The founders were P. Maurato, and P. de Foffomhroni, who having obtained of Pope Celettin V. a permilition to live in folitude, after the manner of hermits, and to obferve the rule of St Francis in all its rigour, feveral idle vagabond monks joined them, who, living after their own fancies, and making all perfection to confift in poverty, were foon condemned by Pope Boniface VIII. and his fucceffor, and the inquilitors ordcred to proceed againt them as beretics: which commiffion they executed with their ufual barbarity. Upon this, retiring into Sicily, Peter John Oliva de Serignan had no fooner publifhed his Comment on the Apocalypfe, than they adopted his errors. They Soretold the reformation of the church, and the reftoration of the true golpel of Chrift, by the genuine followers of St Francis, and declared their affent to almolt all the doctrines which were publifhed under the name of the abbot Joachim, in the "Introduction to the everlafting Gofpel," a book publihed in 1520 , and explained by one of the firitual friars whofe name was Gerhard. Among other enormities inculcated in this book, it is pretended that St Francis was the angel mentioned in Rev. xiv. 6. and had promulgated to the world the true and everlating Gofpel of God; that the Gofpel of Chrift was to be abrogated in 1260, and to give place to this new and everlatting Gofpel, which was to be fubtituted in its room; and that the minithers of this great reformation were to be humble and bare-footed friars, deftitute of all worldly employments. Some fay they even elected a pope of their church; at leaft they appointed a general, with fupetiors, and built monatteries, \&c. Befides the opinions of Oliva, they held, that the facraments of the church were invalid; becaufe thofe who adminiftered them had no longer any power or jurifdiction. They were condemued afrelh by Pope John XXII. in confequence of whofe cruelty they regarded him as the true antichrift ; but feveral of them returning into Germany, were theltered by Lewis, duke of Bavaria, the emperor.
There are authentic records, from which it appears that no lefs than 2000 perfons were burnt by the inquisition, from the year 1318 to the time of Imocent VI. for their inflexible attachment to the poverty of St Francis. The feverities againft them were again revived towards the clofe of the 1 gth century by Pope Nicohis V. and his fucceffors. However, all the perfecutions which this fect endured were not fufficient to ex. tinguifh it; for it fubfifted until the times of the reformation in Germany, when its remaining votaries adoptd d the caufe and embraced the doctrine and difcipline of Luther. And this has led Popifh writers to clarge the Fratricelli with many enormities, fome of which are recounted by M. Bayle, art. Fratricelli.
The Fratriceili had divers other denominations: they were called fratricelli, according to fome, becaule they lived in community, in imitation of the primitive Chriftiar s, or rather through the humility of the founder of the Francifcan order, to which the Fratricelli originally belonged; Dulcini, from one of their doetors; Bizocli, Eiguins, and Beghardi.

FRATRICIDE, the crime of murdering one's brotrer. See Parricide.

FRAUD, in Law, fignifies deceit in grant, or conreyances of lands, \&c. or in bargains and fales of goods, \&c. to the damage of another perfon.

A fraudulent conveyance of lands or goods to deceive creditors, as to creditors is void in law. And a fraudulent conveyance in order to defraud purchafers, is alfo to fuch purchafers woid; and the perfons juitifying or putting off fuch grants as good, thall forfeit a year's value of the lands, and the full value of the goods and chattels, and likewife thall be imprifoned. See Cheating.
FRAUSTADT, a town of Silefia, on the frontiers of Poland, remarkable for a battle gained by the Swedes over the Saxons in 1706. E. Long. 15.50. N. Lat. 51.45 .

FRAXINELLA. See Dictamints, Botany Index. --It is remarkable of this odorous plant, that, when in fill bloflom, the air which furrounds it in a ftill night may be inflamed by the approach of a lighted candle. Dr Wation doubts whether this infammability proceeds from an intlammable air which is exhaled by the plant, or from fome of the finer parts of the effential oil of the plant being diffolved in the common atmofpherical air. The latter is the moft probable fuppofition; for were it the pure inflammable air, as Mr Cavallo obferves, it would, on account of its fmall fpecific gravity, leave the plant as foon as it was produced. Common air acquires the property of becoming inflammable, by being tranfmitted through feveral effential oils.

FRAXINUS, the Ash; a genus of plants belong. ing to the polygamia clafs; and in the natural method ranking under the 44th order, Sepiaric. See Bot.nsy Index.

FRAY literally fignifies to fret; as cloth or fuff does by rubbing, or over much wearing.

Among hunters a deer is faid to fray his head, when he rubs it againft a tree, to caufe the flins of his new horns to come off.

FREA, or Frigga, the wife of Odin, was, next to him, the molt revered divinity among the Heathen Saxons, Danes, and other northern nations As Odin was believed to be the father, Frea was efteemed the mother of all the other gods. In the moft ancient times, Frea was the fame with the goddefs Herthus, or Earth, who was fo devoutly worlhipped by the Angli and other German nations. But when Odin, the conqueror of the north, ufurped the honours due only to the true Odin, his wife Frea ufurped thofe which had been formerly paid to mother Earth. She was worlhipped as the goddefs of love and pleafure, who beftowed on her votaries a variety of delight,, particularly happy marriages and eafy childbirths. To Frea the fixth day of the week was confecrated, which ftill bears her naine.

FREAM, a name given by farmers to ploughed land worn out of heart, and laid fallow till it recover.

Freats, or Freits, a term ufed in Scotland for ill omens, and fometimes denoting accidents fupernaturally unlucky. King James VI. in his Dismonologie, MS. pen. Edit. B. 1. ch. ir. p. 13. "But I pray you forget not likeways to tell what are the Devill's rudiments? E. His rudiments I call firit in general all that quhilk is called vulgairelic the virtu of woode,

Frectles herbe, and iftaine; quhilk is ufed by unlanful charmis without natural cautis. As lykeways all kynd of prattiques, freitis, or uther lyk cstraordinair. actions, quile cannot abyde the treve teiche of naturall raifon. It oc. cars sgain in the fame fenfe in p. 14. marg. note; and in p. 5 r. fpeaking of Sorcerers, " And in generall that naime was gevin thaime for ufing of fic chairmis and freitis, as that craft teachis thaime."

FRECKLES, lentigines, fpots of a yellowih colour, of the bignefs of a lentile feed, fcattered over the face, neck, and hands. Freckles are either natural, or proceeding accidentally from the jaundice or the action of the fun upon the part. Heat or a fudden change of the weather, will often caute the ikin to appear of a darker colour than natural; and thereby produce what is called tan, funburn, and morphew, which feem to differ only in degree ; and ufually difappear in winter.

Perfons of a fine complexion, and whofe hair is red, are the moft fubject to freckles, efpecially in thofe parts which they expofe to the air.

To remore freckles, put juice of lemons in a glafs phial, and mixing it with fugar and borax finely powdered, let it digelt eight days, and then ufe it. Homberg propofes bullocks gall mixed with alum, and, after the alum has precipitated, expofed three or four months to the fun in a clofe phial, as onc of the beft remedies known for the removing of freckles.
FR EDBERG. See Freyberg.
FREDERICA, a town of North America, in Georgia, feated at the mouth of the river Alatamaha, lately built and fortified by General Oglethorpe. The illand it ftands upon is called St Simons's; and is about 13 miles in length, and 4 in breadth. W. Long. 81. 35. N. Lat. $31 . \mathrm{C}$.

FREDERICK II, the Great, of Prufiia, one of the greateft warriors of the age in which he lived, was the fon of Frederick-William then hereditary prince of Brandenburg, and Maria Dorothea a princefs of the houfe of Brunfwick. He was born in 1712, the year before his father Frederick I. mounted the throne of Pruffia. The latter was fo far from being a patron of literature, that he regarded nothing but what related to the military art ; and moit of his generals, whatever their merits in their own line might be, farce knew how to fign their names. So great indecd was the ignor ance of the monarch himfelf, that he banihed from his dominions a philofopher of the name of $I W l f$, merely becaule he maintained the doctrine of pre-eltablilhed harmony; upon which a theologian named Lange, afficted, that on fuch principles his majefty's grenadiers were not culpable when they deferted, it being only the neceffary confequence of the impulie their machine had received from their Creator. His fon was of a difpofition the very reverfe of his father. Being put from his birth under the care of Val de Recoule a French lady of great merit and underftanding, he acquired, in his early years, not only a tafte for literature in general, but a predilection for the French language, which was not obliterated throughout his whole life.
It is not to be fuppoleal that a pritice of the difyofition above mentioned, would fuffer his fon to be long engaged in literary purfuits. At feven jeais of age, young Frederick was taken out of the hand of Madame de Recoule, and put under the care of military tutors. dieneral count de Finkettein, an old wartior, was ap-
pointed his go\%ernur ; his fub-rovernor wis Colonei ic radi: Kalkftein, an oilicer renowned for his courage and ex-perience; he was taught mathenatics and fortification by Major Senning; Han de Jendun, a Frenchman, ir: ftructed him in other branches of knowtedge; and $\alpha$ cadet of the name of $K_{\text {razel, taught him hif exercife }}$ At eight years of age he was fumined with a fmal! arfenal ifored with all forts of arms proportioned to hi age and Itrength, of which his father left him abfolute mafter. In a thort time he was named captain and chief of the corps of cadess; and, the young prince pe:formed every day, in miniature, with bis little foldier: all the evolutions with which his father exerciled h: giants. At laft he received the command of a com pany in his father', regiment famous throughout all Europe, and which was compofed of men of whor: fearce one was ihort of feven French feet.

Born, however, with a tafte for the arts, he devoted to their cultivation every moment he could efcape from the rigilance of his guardians. He was more particularly fond of poetry and mufic, and whea he could find a moment's leifure, he read French authors, or played on the flute; but his father as otten as he furpriied him playing or reading, broke bis flute and threw his books into the fire. The prince, chagrined at fuch injurious treatment, and having a great defire to vifit Gcrmany, England, France, and Italy, defired pernifition to travel. This, however, his father would not allow, bet permitted him to accompany himfelf in the little journeys be made from time to time into Germany ; and, in 1728 , took him to Drefden to fee the hing of Pc. land. By thefe little expeditions the defire of the prince to vifit other countries was only the more intlamed, io that at lait he formed a deign of fetting. out without his father's knowledge. The defign was intrufted to two of the prince's young friends, named Kat and Keti; money was borrowed for the occafion, and the day of their departure fixed, when unluckily the whole project was difcovered. The old king, implacable in his refentment, and confidering his fon av a deferter, determined to put him to death. He was flut up in the fortrefs of Cuftrin; and it was with the utmoft difficulty that the count de Sechendorf, fer: for the purpofe by the emperor Charles VI. was able to alter the king's refolution. Certain vengeance, however, was determined on both the intended aflociates in Frederick's jounncy. Keit efcaped the danger by flying into Hulland; but Kat had not that good fortune. The king firll directed that he thoult be tried by a court martial; but as they, contrary to his expectation, only fentenced the criminal to perpetual imprifonment, the revengeful monarch by an unheard-of exerciie of the royal prerogative caufed him to be beheaded. The execution was performed under the windows of the prince royal, whofe head was held towards the fcaffold by four crenadicrs; but no fooner did he approach the window, and liee hi friend in the hands of the esecutioner, than he dretch. ed out his arms towards him, crying out, " Kat ! Kat !" and inftantly fainted away. During the remainder of his life he confidered capital punilhments with a great degree of horror, and they were rare throughout the Prufian dominions while he continued to reign. When the emperor had fucceeded in preventing the evecution of Frederich, the king remarked, tha: noutihed in her bofom." The royal prifoner remainid a year at Cullrin; during which time lis father uihed that he fhould learn the maxims of government and finance. For this purpofe M. de Munchow, prefident of the chamber of domains and finances, was ordered to make him affit at all their affemblies, to confider him as a fimple counfellor, to treat him as fuch, and make him work like others. The young cuufllor, bowever, though he affitted at their meetings, did not trouble bimfelf with reading acts or - pying decrees. Inftead of this, he amufed himfelf rometimes with reading, French pamphlets, and at whers with drawing caricatures of the prefident or nembers of the affembly. M. Munchow himfelf was likewife very favourable to the prince at this time, by furnifhing him with books and other articles of amufement, notwithtanding the exprefs probibition of his father; though in this he certainly ran great riks; for the old king, who fet but a very light value on buman life, would undoubtedly have put him to death had be received intelligence of his complaifance.

Frederick, atter palling the time above mentiuned in confinement, was recalled to Bcrlin, on pretence of being prefent at the celebration of lis eldetl fifter's marriage with the hereditary prince of Bareith; but the true reafon was, that the king had now prepared a match for the prince himfelf. This was the princefs Elizabeth Chriftina of Brumfitick, niece to the emprefs. Frederick, who was not only totally indiffesent to the fair fex in general, but particularly preiudiced againt this princefs, made fome objections; his father, however, overcame all obttacles with " his ufual arguments (fays the author of the life of Frederick), viz. his cane, and a few kicks."

The coldnefs which Frederick at this time fhowed for the fair fex appears not to have been natural; for as early as the year 1723 , though then only in the 1 th year of his age, he is faid to have fallen in love with the princefs Anne, daughter of George 1I. Even at this early period he entered into vows to refufe every other but her for his conlort ; nor were thefe ever broken, as far as depended on himelf. The maniage perhaps would have taken place, had it not been for fome differences which arofe between the courts of Pruflia and Hanover about a few acres of meadow land, and two or three Hanoverians inililed by the Prulian recruite:s. It is fuppofed allo, that it was intended at che time to marry him tu Maria 'Therefa of Auttia; but, as in that cafe it would have been necefliny to change his reigion, Frederick alcrived from thence a plaufible pretence for refuling the match. The princels whom he efpoufed had a large thare of beanty; and, what was thin better, an excclitet heart : but Frderich is fiid to have fuffered fo much in his former amous, that coitain natural and infurmourtable impediments remainced to the completing of his manaiage with any ucman. Scarcely therefure was he in but with his young fpenfe, when a cry of Firt! Wal raifed ly his friends. Fiesetick got up to hee whese the contlayration was: Lut linding it to be a falfe alarm, he fent melfengers to cuturnio the princels; but neither that night, ar any outher, did he think proper to dilturb herwhl.

On orrafion of this naringe, Frederick received

the capital of this county, named alfo Kupin, for fomeFrederick. time; but afterwards chofe RLeiniberg for his place of abode. This is a little town built in the fands, on the confines of Mecklenburg, and at that time containing only 1000 inhabitants; but it was foon greatly improved by Frederick. Having put over the great gate of the cafte, however, the following infeription, Frederico Trixoullitatem Colenti, his father was difpleafed with it, and therefore hurried him from his peaceful retreat into the noife and tumult of war. At this time the fucceffion to the crown of Poland had hindled a general war throughout Europe, and the king of Pruffia was to fend 10,000 ausiliaries to the Imperial army, then commanded by Prince Eugene. The king conducted his troops in perfon, and refolved to take this opportunity of giving his fon an idea of war. At this time, however, he learnt but little ; and only faw, as he himfelf expreffes it, the flaadow of the great Eugene. That confummate general, neverthelefs, did not overloook his merit ; but predicted that he would one day be a great captain. Frederick having gone to reconnoitre the lines at Philipiburg, in his return through a very open wood, was expofed to the cannon of the lines, which thundered inceflantly. The balls broke a number of branches on every fide of him: notwithitanding which, he never caufed his horfe to move quicker ; nor did his hand which held the bridie ever alter its motion even for a moment. He continued to converfe quietly with the generals who attended him, and never howed the fmalleft fign of apprehenfion. Being one night at lupper with FieldMarihal Grumkow, the converfation turned on the young Prince Eugene who died on the Rhine ; and he was afked whether that prince would ever have become a great man? Frederick decided in the negative, on account of young Eugene's not having known at any period of his life how to choofe a friend who dared to tell him the truth.

During this campaign the health of the old king was fo much impaired, that he was obliged to leave the army ; and Frederick, on his return, was for fome time intrufted with figning all the orders in his father's name. On the king's recovery the prince was fent to Stettin, under the care of the prince of Deffau, that he might fee the fortifications of that town. He was afterwards permitted to go to Konigiberg to fee the unforturate Stanillans, who had takea refuge in that place, and who was no lefs renarkaule for his philofophy and contancy than for his misfortuacs. Wit's him Frederick remained for fome weeks, and contrasied a friendhip which was not diffolved but by the death of Stanilaus. At lait he was allowed to return to his peaceful manfion at Rlacintberg, where he remained till the death of his father. In this place bis time was occupied alternstely by the tludy of the fiences, the cultivation of the art, and the pleafures oi frichulhip. Philoluphy, hillony, politice, the military art, poetry, and mutic, agrecably fucceeded cach other, and hat cach its itated priod. The prince palled the greate.t Fart of the day in his libras ; and the remmuer in the fociety of a felect company of a treeabic and learned men. The principal of thele were Clyofor, a Freman oflicer; Kis ferling, a genteman of Courland, on :hom the prince betowed the mane of 6 C.faion; Jondan, a

## 

Frederick.ings and gardens; but who could converfe on all the arts of detioning wilh great taile and judgment-In thefe meetings, gaiety generally profided ; there wese generals to fpeak of war, mulicians to form concert, and excellent painters to decorate the arartmente. Whiin Knoleldorf was executing landicapes and laying out the gardens, Pefle was immortalizing himielf by his cielinge, and Du Buillon by his pictures of thowers. The two Granns compofed excellent numic, or cireeted the orcheitra; and Benda, one of the firtt volins of Europe, accomparicd the prince who played extremely well on the tlute. The morning was ufual. ly dedicated to tludy; gaiety and agreeable converiation prevailed at every repalt; and every evening there was a little concert.-In this retreat Frederick conceived that ardent palion for military glory and the aggrandizement of his kingdom for which he became at latt fo remarkable; and here he is fuppoted to have formed the moft fublime and daring projects. He was fired with a defire of imitating the celebrated heroes of anticuity, of whom he read in the ancient authors, and for which he fet apart fome hours every day. Amongth the works which he read almolt every year were Hcrodotus, Thucydides, Xenophon, Plutarch, Tacitus, Solluit, Livy, Quintus Curtius, Corneliun Nepor, V lerius Maximus, Polybius, Curar, Vegetiu, ser. He never fpoke but with enthuriafm of the great warriors of Greece and Rome; and when feated on the throne thought he could never diftinguifh an able foldier in a more honourable manner than by confering on him a Roman furname. Hence he diftinguilied by the name of euintus Icilus MI. Guichard, who had written fome treatifes on the military art of the ancients; giving him at the fame time a free battalion. This name of Quintus Icilius was retained by M. Guichard as long as he lived.

In his purfuit of glory Frederick found that it was not improper to cultivate the friendihip of celebrated poets, philoophers, and others of the literary clafs; for which purpofe he flatered, commended, and complimented all the moft celebrated literati of Europe at that time. "The philofophers ( Gays the author of his life) anfwered him as a mad lover writes to his misdref. They weote to him that lie wan a gatet pme , a sreat phif fopher, the S.LMon of the morth. All the: hyperictes wete printed; and Solomon was not furry fur it, thougt, he had too much maderlanding to believe in them. Wolf, Rollin, Gravefande, Maupertuis, Allyaroti, Voltaire, were hoonoured with hif correfpondence. The laft efpecially, actutlomed to offor up incenfe to the idol of the da., were it tranfiputed from the dunghill to the altar, did not fail to caile ion the firt man of the univeric a piance who was in pectancy of the throne, and viounared him that i.e was the greatelt philuf pher of the $a_{2} e$ and the thit put in the world."

That Frederick mis!.t !.cop up ri- elarano with the litenati, or jerhaps froma: real presticetion for hiv paincific, he etronized the Apolusy of llait, m that his primeipal treatifes tranflated into) Tremit. He even frevailed upou his iathe to relas a lite'e in fivesur of Sur phisforther. I conmilion of ofermed and La-

 stuce till the year 174, whan his protector was feated on the throne.

Juring his retidence at Rheintherg, Frectia's compoled his refutation of the pataciples of X1 whinal, under the title of Ans:- Mat later!? of wheh he fent. the manufcript to Volt ire to corred, and to get pinted.
the old king, now almad worn out with intirmity, faw with regret the predilection his ton entertained tor men of letters; and, in his pecsibh fits, oten threitened the whole fociety with confmement in the Er:rets of Spandau. Thete threats frequently oce sfined a violent alarm among the joyous company at Rheinberg, which it required all the eloquesce of Frederich t quiet. Their apprehenions on this account, however, were foon removed. At the commenrement of the year 17 t , the king's diforder incereated tu a great degrec, and in the month of M.y his cale became defperite. He lived, however, till the $3^{\text {th }}$ of that month, when he expired, and leit the throze to hin fon Frederick Il.

The acquiltion of a hingilom did not abate liederick's paifion for literdture, though to this he was now obliged to fuperdda the qualities and latwors of a greent hing. A confideration of his tranfections in this character talls under the article Pressia, to which we tetir thefe, indeed, fo totally engrofied the remaining part of his life, that little more remains to be faid under this article, than to relate fome ancedutes by which we mar be in fome meafure able to trace the chardeter of this great and ingular perfonage.

It has already been mentioned, that in the carly pait of his life, Frederich had conceived a sreat inclination to travel. This pation leems not to have been extiguibed ly the fytendour of his new fituntion; fur having, foon after his accef?ion, gone into Prutia and Weltphalia to receive the lomage of the indalitant, ho formed a refolution of proceeding anernity as tar aso Paris. Being difovered at Sirabours, however, h: laid afide the delign of proceeding to Paris, and wer: to fee his ftates in Lower Cemmany. Hete he wrot? the celebrated Voltaire, that he divild come inc ;".: to vifit him at Bruflels; but being feized wish an it difpolition in the little palace of Weur, two leathe
 forming him that lue expecicd be hawat mone the it: athances. The followise cation accosent is given him of his reception, \&ic. " The only kword I tuenid at the gate was once liddier. The paidy coustitior. Bambonct, was cooling his hew in the cwart: hee hat large rutles of dinty linan ; : hat fall of hoina and an old mateiterial peruke, one ced of which wete cad d as lo:

 par, is if I had beal hiv firn gayan. Whe fit on -

[^5]Tredenik. we convenfed profoundly on the immor' . ity of the foul, on liberty, and the androgynes of Plato."

This rigid economy, and contempt of every luxury with regard to his own perfon, was maintained by Frederick as long as he lived. The following account, taken likewife from Voltaire, will give an idea of his manner of living. "He rofe at five in the morning in fummer, and fix in winter. A lacquey came to light his fire, and drefs and thave him ; and indeed he almoft wholly dreffed himfelf. His room was not inelegant. A rich balluttrade of filver, ornamented with little cupids, feemed to enclofe an alcove bed, the curtains of which were vinble; but behind them, inftead of a bed, there was a library: the king flept on a truckle bed with a flight mattrefs concealed behind a fcreet. Marcus Aurelits and Julian, thofe apothes of Stoicifm, did not deep in a more homely manner. At feven his prime minifter arrived with a great bundle of papers under his arm. This prime minifter was no other than a clerk who had formerly been a foldier and valet-de-chambre. Too him the lecretaries fent all their defpatches, and he brought extracts of them, to which the king wrote antwers in two words on the margin : and thus the affairs of the whole kingdom were expedited in an hour. Towards eleven the king put on his boots, reviewed his regiment of guards in the garden, and at the fame hour the colonels were following his example in their refpective provinces. The princes his brothers, the general officers, and one or two chamberlains, dined at his table ; which was as good as it could be in a country where there is neither game, tolerable butchers meat, nor a pullet, and where the very wheat is brought from Magdcbourg. After the repaft, he retired alone into his cabinet, where he made verfes till five or fix o'clock. Then came a young man named D'Arget, formerly tucretary to Valory the French envoy, who read to him. A little concert began at feven, in which the ling played on the flute with as much flill as the firft performer; and pieces of his compofition were freguently executed. Supper was ferved in a little hall, the fingular and ftriking ornament of which was a picture, the defign of which he had given to Pefne, one of our beft colourilts. It was a fine picture of Priapus. Thefe repafts were not in general the lefs philofophic on that account. Never did men converfe in any part of the world with fo much liberty refpecting all the fuperititions of mankind, and never were they treated with more pleafantry and contempt. God was refpected; but nonc of thofe who had deceived men in his name were fpared. Neither women nor priefts ever entered the palace. In a word, Frederick lived without a court, without counfel, and without religious worfhip."

As Frederick had efpoufed his princefe entircly contrary to his inclination, it was imagined that on his accrfion to the throne he would embrace the opportunity of fetting himfelf free from engagements fo difagreeable to himfelf. The queen was not without fufpicions of this kind, infomuch that the was on the point of fainting away when he made his firf vifit to her. To the furprife of all parties, however, he made her a very affectionate fpeech, apologizing for his indifference, and inviting her to participate with him the throne of which the was fo worthy. In the firlt year of his reign he $\cdots$ ored the arademy of fciences at Berlin which had
been founded in 1700; but he foon became difguted Fredericic. with its mombers, whom he endeavoured at all times to ridicule rather than encourage. His war with the queen of Hangary, however, which took place almoft immediately after his acceffion, for fome time prevented him from taking fuch an active part in literary matters as he was naturally inclined to do. After the peace, being at liberty to follow his inclination, he gave full fcope to his paffion for literature; and in the interval betwixt the conclufion of the firft wax and beginning of that of 1756 , he compofed moft of the works which are now afcribed to him. At this time he wrote his Hiffory of my own Times, afterwards announced among his polthumous works. In writing hiftory he acquired a talte for hiftorians; and juftly gave the preference to the ancients, the moit celebrated of whofe works he perufed every year. Voltaire was his priacipal literary correfpondent, whom he invited to refide with him. Afraid of loling his liberty, however, that philofopher helitated, excufed himielf, and entered into pecuniary treatics, firf for himfelf, and afterwards for his niece Madame Dennis, whom he wilhed to accompany him. At lalt he was determined by feeing a poem from Frederick to M. d'Arnand, in which the latter was compared to the rifing, and Voltaire to the fetting fun. By this Voltaire was fo much piqued, that he fet out for Berlin without delay, and arrived there in June 1750 . He was received in the moft magnificent and affectionate manner, and for fome time his fituation was very agreeable; but the difputes and rivallhip which took place betwist him and Maupertuis foon threw every thing into confufion. In thefe the king interfered in fuch a manner as was certainly below his dignity ; and he often exercifed himfelf in making a jeft of the other men of letters in a way exceedingly difgufting, and which induced many of them to leave him. The fquabbles with Voltaire were fometimes very diverting; an account of fome of which is given under the article Voltaire. They ended at laft in a final quarrel with that wit, and his departure from the kingdom. The reftlefs difpofition of Frederick thowed itfelf after his departure, by his attempts to provoke the literati who remained at his court to quarrel with him as Voltaire had been accuftomed to do. But they were of too paflive a difpofition to gratify him in this refpect, choofing rather to fuffer the moll mortifying ftrokes of raillery, or to leave the kingdom altogether, than to contend with him. This proved fo unealy to the king, that he one day exclaimed, "Shall we have no more quarrels then "" The breaking out of the war ir 1756, however, put a flop to this diverfion, and afforded him as many enemies as he could wifh. The exploits he performed dnring the feven years which this unequal conteft lafted, are almoft incredible * and it is amazing how the fortitude * See Pris. and refolution of any perfon could enable him to fu-fia. ftain the difficulties which durizg this period he hat to encounter. In onc fatal moment, indeed, even the refolution of Frederick was on the point of giving way. This happened after the battle of Colin, when his affairs feemed altogether defperatc, before they were ictrieved by the victory at Rosbach. At this time he wrote to his fifter at Bareith, that be was on the point of putting an end to his own life; but as this refolution did not extinguifl in him the love of glory, he

## $\begin{array}{ll}\mathrm{F} & \mathrm{ll} \\ \mathrm{E} \\ \text { aid that he made veries on the brink of }\end{array}$

 $\underbrace{\text { thith this wicw he wrote a long pocti- }}_{\text {Frederick, wihed to have it faid that he made verfes on the brink of }}$ cal epiftle to the marquis d'Argens, in which he communicated to him his defign, and bade him farewell.Hzppily, at lat, the king's affairs took a better turn, and fuch defiperate thonghts were laid afide. His conllitution, however, was irreparabiy injured by the excelive fatigues he had foltained. Soon after the conclufion of the peace, his body began to bend, and his head to incline to the right fide: By degrees be became very infirm; he was tormented with the gout, and fubject to frequent indigetlions. All his diftempers, however, were born with invincible patience; and, till a very ihort time before his death, he never ceafed to attend his reviews, or vifit the different provinces of his dominions. He bas been known to review his troops, and galiop through all the ranks, as if he felt no pain, notwithftanding that an abfeefs which had broken out upon him, and approached to a fuppuration, frequently, upon fuch occations, tonched the faddle. In Auguit 178 ; he impaired his health ttill farther by affilting at a review, where he was expofed without even a cloak to a heavy rain for four or five hours. On his rcturn to Potzdam he was feized with a fever; and, for the firft time, became unable to alifit at the military e.aercifes of Potzdam, which take place in September. His malady, however, did not prevent him from dictating the difpofition of thefe exercifes daring the three days they latted, and he always gave the word in prefence of his generals and the foreigners of diftinction then at Potzdam. About the end of autumn the fever left him, but was fucceeded by a violent cough; and he continued free from the gout which had ufually attacked him at this feafon. He was greatly weakened by the cough, which prevented him from fleeping; but this did not in the leaft interrupt him in the execution of bufinefs. Every morning, at four or five o'clock, he ordered the three cabinet fecretaries to enter his apartment, where he dictated anfwers to their papers. It was not till after the defpatclo of all his affairs that he faw a furgeon or lometimes a phylician, though he had a bad opinion of the phyficians in general, whom he confulted on his ditemper. In the evening he amufed himfelf from five to eight with fome of his fociety; and after that hour he paffed the remainder of the time before be went to refl, in hearing forse ancient authors read to him; and thns he continued to employ himfelf till the very day before he died. On the 17 th and 1 th of May $1-86$, he was unable to affift at the ordinary reviews, but fill he hoped to be prefent at thefe of Silefia. He feveral times attempted to mount bis horle to go to the parade at Pu:zdam; but finding his powers infufficient, he was obliged to return, after having proceeded a feu paces. He made other attempts, but with as little fuccelf; and at lant his diforder terminated in a dropfy. Being now no longer able to remain in bed, he fat day and night in an arm chair with fprings which could be moved at pleafure. For near a month before his death the fwelling of his feet gave him violent pain, fo that he willed an incifion to be made ; but the furgeon refafed to perform the operation, falpecting that it might hatien his death. Nature, however, accomplithed his defires; his right leg opened, and difcharged fuela a emantity
of matter, that he was greatly relieved: and thofe un $-\mathrm{Frefol}_{1} \cdot \mathrm{k}$. acquainted with the medical art began to entertain hopes of his recovery. The phylician, however, were of a very different opinion; and thee event juttifed their apprchenfions. On the 16 th of Auguit 1786 his throat began to rattle violently, and his attendants expeited every moment that he would breathe his lat. In this fituation his three fecretaries, entened the roms for the defpatch of bufinefs as ufnal. Even then Frederick made an effort to colleet his force, giving them a fign to wait, as if he would fpeak with them in a thort time. This, howcere, was the lafl he could make: for be foon after feli into a ftupor; though from this he recovered fo far as to be able to fpeak. In the evening hic alked what o'clock it was and on being anfivered that it was nine, he faid, "Well then 1 am going to rett." His refpiration and voice became gradually more feeble; and he expired on Tharlday at 19 mi . nutes after two in the morning, without any convul fion or fymptom of pain.

This great monarch was of the middle fize, had large blue eyes and a piercing look. He fipoke Ger. man incorrettly, and in a very rough mamer; but talked French very tluently, and his voice was then mild and agreeable. His con!litation was naturally feeble, but he had greatly improved it by lis activity and laborious life. He had the art of relieving every once from that embarraffinent which frequently occurred in accotting fuch a celebrated monarch; and it feems probable that he himfelf confidered on what he thould fay to any illuftrious perlon who happened to come to his court. His univerfal knowledge enabled him to converie on all fubjects; and thas he talked of war with military men, of verles with the poet, of agriculture with the farmer, jurifprudence with the lawyer, commerce with the merchants, and politics with the Englithman. He had a very retentive memory; was fond of folitude and gardening; and likewife took great pleafure in dogs, of which animals he contantly kept a number about him, giving them little balls covered with leather to play with. In company, he was fond of afking queitions and jefting; in which latt he proceeded fuch lengths as undoubtedly were unbecoming in a fuperior towards his inferiors, who wonld not have f.iled to refent fuch jokes from perfons more on an cquality with them. In military affirs he was eaceffi:ely fevere, not to fay cruel; of which the following anecdote may ferve as an inflance. In the firit war of Silefia, wilhing to make fome alterations in his camp during the night, he furbade every perfon, under pain of death, to heep, after a certain hour, a fire or other light in his tent. He himfelt went the rounds; and in falling the tent of a Captain Zietern he perreived a light. Entering the tent, be fonad the cap. taia fealing a letter to his wife, for whom he had a great affection. "What are you doing there: fay, the king:) Do yon not know the order:" The cajtain fell on his knets and atked pardon, but did not attempt to make any excule. "Sit down (fyys Frederich), and add a few nords I am going to dictate to yon." Zietern obeyed; and the hing dictated, "Tomorrow 1 thall perihi on a faffold." The unfortunate man wrote them, and next day was executed. In matters of domeitic legiliation, the was more arbitrary anan ; of hich we bive a notable example in the

## F R E [ 224$] \quad$ F R E

trecrini.fumouscafe of Amold the miller. The man had refufed indarisito pay the rent of the mill he pollent d, on pretence r that the flream which turned it had been diverted into a filh pond. This was evidently a frivolous excufe; lecaufe the water which ran into the pont ation rat of it into the fame channel as betore, fo that reang coutd be lot except what evaporated from the torine t if the filh poud. The judges theretore gave fentence "gainf the miller; but the king not only reveried their fintence, but difgraced them. For this he was celebrated through all the newfapers in Lisope; and yet he was in the wrong, and altwards even achnowledged himfelf to have been fo: but, notsithftanding le hew hi error, he not only made no reparation to the parties he hid i: jured, but allowed them to lie in yrifon at Spandau atl his liftime, fo that they were wot relealed till the commencement of the fucceeding reign. He entertained certain and ahnot maccomitable prejudices againtt certain places ard perlons, which neciber condat nor merit cund eradicate. One of thec matotunate phaces was Weitphalia, on which he the ver conferred any bounty: and one day a native of that country, a man of great merit, being propofed io him for a place, he refufed, laving, "He is a Weft phatian; he is good for nothing." Voltaire aceules him of ingratitude to the comt de Seckendorf: who, as we have already feen, faved his life, and again!t whom he afterwards conceived moft implacable hatred. His indifference towards thole who affolded him the mott ellential fervice, was evident : when a robutt butcher prevented him from falling, horle and all, over a precipice, where both would have undoubtedly been hilled, the king, fenfible of the affitance that had been afforded him, turned about, and laying, "Thank you, friend," rode off without cver enquiring farther about the perfon who had juft preferved him irom defiruction.

With regard to the literary merits of this monareh, we certainly camot pronounce them extraordinary. Voltaire boafts of having corrected his works, and others of having furnihed him with materials for his hittory. He has been accufed of borrowing whole hemilichs of poetry from Voltaire, Boilean, Rouffeau, and others; wor does the charge appear to be at all void of foundation. Such of his verfes as appear to have undergone no correction, are very indifferent, nor indeed can we pronounce any of his pectic works to be of the fall rute. In the former part of his life fe entertained a great partiality for the French learning and language ; but as lee adranced in years, he entiscly loft this predilection, and inclined much more to favour the Eughith and Germans. Towards the end of his life, indecd, he affected a contempt for the French, without whom it it faid he would farcely ever have made any figure execpt in military affairs.
frabirick, is the name of two conntics, and of feueral tomnlips in America, fuch as the county of Fredetich i. Maryland, which contains 30.791 in habitants, is which are included $36 f^{1}$ haves. It is allo the name of a conity in Virginia, 30 miles 1 ng and 20 broad, ath a population of ly, $4_{1}$ lubl, including +250 3.ser.

IR1:1FRRICKSBURG, a fort and colony of B:andenburg, on the gll coat of Guinea, in Afri-

Cane Coalt. It mount $4^{6}$ pieces of cannon on four Friderick battcries; and formerly belonged to the Pruffians, but hall is now fulject to Denmark. W. Long. 1. 15. N. Lat. Free flore. 4.30.
íREIERICKSHALL, or Fkederichstadt, a frong town of Norway, in the prefecture of Agerhuys, where Charles Xill. king of Sweden was killed by a muket hall in 1718 , when he was befuging this. town. It is feated on the coalt of the Catagate, in E. Long. 10. 45. N. Lat. 59. 2.

IREDERKKSODE, a town of Dcumark, in Iutland, tuken by the Swedes in 1657 , but now fubject to Denmark. It is leated near the fea, in E. Long. 10.0.N. Lat. 55.42.

FKFIDERICKSTADT, a town of Denmark, in South Jutland, built in 1621. It is feated on the river Eyder, in E. Long. 9. 23. N. Lat. 55. 32.

Frfoerichstidt, a tohn of Norway, in the province of Agerhuys, feated on a bay of the fea, near the frontiers of Sweden, in E. Long. ir. 6. N. Lat. 59. 12.

FREE, in a general fenfe, is ufed in oppofition to whatever is conitrained or neceflitated. When applied to things endowed with underftanding, it more peculiarly rclates to the liberty of the will.

Fres Bench, fignifies that eftate in copyhold which the wife, being efpoufed a virgin, has after the deceafe of her humband for her dower, according to the cuftom of the manor.

In regard to this free bench, different manors have different cultoms : and in the manor of Eaft and Weft Enbourne in the county of Berks, and in other parts of England, there is a cuftom, that when a copyhold tenant dies, the widow thall have her free bench in all the decealed hubband's lands, dum fola et cafta fuerit, "while fthe lises fingle and chafte;" but if the is found to be guilty of incontinency, fhe fhall forfeit her eftate. Neverthelefs, upon her coming into the court of the manor riding backwards on a black ram, with his tait in her hand, rehearling a certain form of words, the iteward is bound by cultom to reltore her to her free bench. The words are,

Here I am,
Riding on a blach Ram,
Like a whore as 1 am ;
And for $m y$ crineum crancum
Have loll my bincum bancum,
And for my tail's game
Have done this wordly thame :
Therefore, pray Mr Steward, let me have myland again.
FkFE or Impcrial Cities in Germany, are thofe not fubjuct to any particular prince; but governed, like republics, by their own magitrates.

There vere free cities (litera civilater) even under the ancient Roman empire: fuch were thote to whom the emperor, by the advice or confent of the fenate, gave the privilege of appointing their own magillates, and governing themflves by their own laws. See Ciry.

Frfe Fi/bery, See Free Fishery.
Frebllarrin. See Warren.
Fkef Mafon. See Masov.
Fras Sene, a whitih tlone, dug up in many part,

## F R V

Ficeoooter of Britain, which is hard and durable, and of exallent ufe in building. \&ic. It is a hind of the grit flone, but finer fanded and finoothed; and is called froc, from its being of fuch a contlitution as to cut freely in any direction.
Thie qualities of the feveral hinds of free fones ufed in the different parts of Europe are very different. They all agree in this general property indeed, that they are lofter while in the quarry than when they have been fome time expofed to the air: but even this general property differs greatly in degree. There is a fort of gray free tone in ufe at Paris (of which we do not yet feem to have met with any in this country), which has the above mentioned quality in fo great a degree, that the expence of working it is in great mieafure faved.

This ftone lies everywhere on the fouth fide of the river Stine, and is of a coarfe and large git. It is fo iof when newly taken out of the thrata, that they fathion it very conveniently with a fort of broad axe, and form as many lones for building in this manner in an hour, as an equal number of our people do in a day or two. Though this ttone is as foft as dry clay when fir! taher: up, it is found to harden fo contiderably in the air, that it becones more than equal to our ordinary free ttone.

The Portiand free itune of Britain of the finelt kind, which is white, and of a clofe grit, is very fit for hewing and carring; but it will neither refirl water nor fire, which is a very fingular intance in fo denfe a tone; while the free fione of Kent, which is leis beautiful to the eye, and is of a grasiih colour, and confiderably clote, though of a larger grain, refifts the air and water very well. The free tlone of Derbyihire, on the other hand, is fo brittle as to be unfit for any fine working; and fo coarle and open in its texture, that it lets water through : yet it bears the fire extremely well, and is fit for ovens, hearths, \&c.

Freebooter, or Futblster, a name given to the pirates who fcour the American feas, particularly fuch as make war againtt the Spaniards. See Bucasier.

FREEDOM, in general, the flate or quality of being free. See Libikty.

Frefdom of a Corporation, the right of enjoying all the privileges and immunties belonging to it. See Corporation.

The freedom of cities, and other corporations, is regularly obtained by ferving at apprenticelhip; but it is alfo purchafed with money, and fometimes conterred by way of compliment.

## Frefdom of Confiethace. See Tollrattoc.

Freedsa of the IIII, that power or farulty of the mind, whereby it is capable of acting to not asting,
see Mice. chooling or rejecting whatever it judges propert. Of
 a power to begin or furbear, continue or end feveral action, barely by a thought or preference of the mind.

FREEh(OI.D, Frask Tenfuewt, (hibertum tencmentum), is land, or tenement, which a man hodd, in fict-imple, fic-tail, or fur term of litic. Sce Fee and Talt.
Freeliold is of two hind, in deed and in law.
The firf is the real pofeffion of land or tenement Vol. IX. Part I.
in fee, feetail, or for life: the otiner 1 , the raht $a^{-7}$ armber mun has to fuch land or tenement betore his entry of leizure.

A freehold, ly the common law, canmot commence in futuro, but it mutt take effect premily, either in Fofieflion, reverfion, or remainder. Whateser is pat of the frechold goes to the heir; $2 \times 1$ thangs fined thereto may not be taken in diftrels for 1 cot , or in eaecution, Exc. No man flatil be difleiked of has beebold by tat. Magna Charta, cap. 29. but by judgment of his peer, or according to the law of the land nor fhall :ny diftrain freeholders to anfwer for their frechold in any thing concerning the fame, withont the hing's writ. Freehoid eltates, of certain value, ate required by flatutes to qualify jurors, electors of the knights of the fhire in parliament, \&ic.

Frfermond is likersife extended to fuch olfices as a man holds in fee, or for life.

Prefhold is allo fometimes taken in opposition to villenage.

Lambard oblerves, that land, in the Saxons time, was ditinguithed into bock/and, i. e. holden by hook or writing; and folk/and, held without writing. The former, he lays, was held on far better condition, and by the better fort of tenants, as noblemen and gentlemen; being fuch as we now call frechldd: the latter was molly in polletion of peafants; being the fame with what se now call at the weill of the lord.

In the ancient laus of Scutland, frecholders are called milites, " knights." In Reg. Judicial. it is evpreffed, that he who holds land upon an execution of a ilatute merchant, until he hath fatisied the deht, conct ut liberum tenementum fobi et aljanatus fuis; and the fame of a tenant per elegit: the meaning of which feems to be, not that fueh tenants arc ficelolders, but as freeholders for the time, till they have recived profits to the value of their debt.

IREETHINKER. Sce Dirt.
FREEZE, Frtezl, or Frizt, in Combucor, Sue Frize.

Frefze, in Architecture, that pat of the entablatione of columns, between the architave and comilile.

The freeze is properly a large int ince, or menber feparating the architrave from the comi he.

The ancients called it $\approx$ orphoru, was ufually enriched with fiyures of animais: and ou: denomination frceeve has a like ongin, being formed of the Latin pliry/sin, " an embioiderer," becaute it is commoniy adorned with feulpture in 1sto relicvo, imitating embroidery.

FREFZING, in Philosiphu, the hame with consegation. Sue Congelatmos, Frose, and Iaf.

Fhefzing Rain, or Rainng lic, a very uncummo: kind of hower, which fell in the wedt of Fagland, in December 1672 ; whereof we have disete accuunts in the Philofophical Tranfaction.

This rain, as foon as it tuuched any thirer above ground, as a bough or the like, immediately lettled into ice, and by multiplying and colarging the icicles. broke all down with its weight. The rain that fell on the frow immediately froze into ice, without finking in the fnow at all.

It made an incredible deftruction of trees, beyond any thing in all hitory. "Had it concludel vitle fome gut of wind (fay; a gentleman on the foot), it Ef bught

## F R E $[226] \quad \mathrm{F}$ R E

Fright mizht have been of tertible confequence. I weighed the jprig of an ath tree, of jutt three quarters of a pound; the ice on which weighed 16 pounds. Some were frighted with the noife in the air; till thy difcernel it was the clatter of icy boughs, dahed agaiml esch other." Dr Beale obterves, that there was no contiderable frot obferved on the ground duaing the whele; whence he conchade, that a froit may be very intenfe and dangerous on the tops of fome hilh and plains, while in other places it keeps at two, three, or four feet diliance atove the ground, rivers, lakes, \&ic. and may wander about furious in lome places and remifs in others not far of the frof was followed by glowing heats, and a wondevful forwardsels of fowers and fruits.

FRELGHT, in Aavgation and Commers, the hire of a thip, or a part thercof, for the cunseyance and carriage of goods from one port or place to anther; or the fum agreed wis between the owner and the merchant, for the hire and we of a volel. See Maritione Livis.

FREIND, JoHs, a mont leamed Englith phyfician and writer in the 18 th century, was burn at Croton, Northampomhire, in $16 \% 3$. In if 06 , he publithed, in sonjuntion with Mr P. Foulkes, an edition of two Geeek orations, one of Elchines agame Ctenphon, and the other of Demothenes de Corma, with a new Eatin vertion. In 1699 , he wrote a letter to Dr Solane concening an Hystrocentalus, publithed in the Philoisprical Pranfactions; and another letter in Latin to : 'e Chme gentleman. 1): pa/mis rartur. Fiforia, printed in the fame Tranfactions. In 1703, his Emmenalogzt appeared, which gained him great reputation. In 1704, he was chofen profeffor of chemitity in the univerfity of Oyeral. In 170 , he attended the carl of Peterborough in Syain, as phytician to the army there; and, upon his return in 1907 , publihed an account of the earl's expedition and conduct. In 1709 he publifhed his Chemical Lectures. In 1712 be attended the duke of Ormond in Flandere, as his phyfician. In 1716 ine wa, admitted a fellow of the Colicge of Phyficians in Londun. This year he publened the fret and thitd boush of IHppocrates De morl is popularibus, with a Commentary on Fevers, written by himfelf. He fit nember for the borough of Launcelton in Cornwal in 1722 , where be dininguilhed himfelf by his oppoition to the adminilkration. March 1722, he was committed to the Toner on a charge of high treafon; and while he was under confirement, he wrote a L.atin epitle to 1): Mead, De quibufann variolarum generibur; and began his Hitory of Phyfic, the firt part of which was publihed in 1725 , and the fecond in 1726 . Upon the acceflon of George II to the throne, he was appointed phyician in ordinary to the queen, who thoned the utmeft regard and efteem for him. He died at L ndon in 1728 . His works were publithed together is. Latin at Londor, 1733 , in folio, and dedicated to the queen.

FREITS. See Frents.
FRENCH, in general, fomething belonging to Arance, thus we fay, the French language, French cutum, polity, \&ic.

The French language, as it now itand, is no original or mothere languace. but a medley of feveral. The fe that previnl moit, and which are, as it were, the Ladis
thereof are, 1 . The Ctltic; whether that were a par- French. ticular language itielf, or whether it were on'y a dialect of the Guthic, as poke in the weit and north. 2. The Latin, which the Romans carried with them into Gaul, when they mase the conqueft thereof. -Ind, 3 . The Teutonic, or that dialect of the Teutonic fpoke by the Frank:, when they gaffed the Khine, and eltablimed thenfelves in Gaul. Of thefe three languages, in the face of about thirteen hundred Jears, was the prefent French formed, fuch as it is now found. Its progrelis was very flow; and both the Italian and Spanith were regular languages long before the French.

Pafquier obferves, it was under Philip de Valo's that the French tongue firlt began to be polihed; and that, in the regiller of the chamber of accounts of that time, there is a purity feen almott equal to that of the prefent age. However, the French was fill a very imperfect language till the reign of $\mathrm{F}_{1}$ ancis I . : the cutom of peaking Latin at the bar, and of writing the public acts and inftruments of the courts of juthice in that language, had made them overlook the French, their own language. Add that the preceding ages had been remarkable for their ignorance, which was owing, in a good meafure, to the long and calamitous wars which France had been engaged in; whence the French noblefe deemed it a kind of merit not to know anything; and the generals regarded little whether or not they wrote and taked politely, provided they could but fight well.

But Francis I. who was the reftorer of learning, and the father of the learned, changed the face of things; and after his time, Henry Stevens printed his book, De la Pracellence du Langage Frangois. The change had become very confpicuous at the end of the 16 th century; and under Henry IV. Amyot, Coeffeteau, and Malherte, contributed towards bringing it to its perfection; which the Cardinal de Richelieu completed, by the eflabliflment of the French academy; an affembly, wherein the molt diftinguifhed perfons of the church, the fivord, and the gown, have been members. Nor did the long reign of Louis XIV. contribute a little to the improvenient of the language; the perfonal qualitics of that prince, and his tatte for the fine arts, and that of the princes of the blood, rendered his court the politell in Europe. Wit and magnificence feemed to vie; and bis generals might have difputed with the Greeks, Romans, \&ic. the glory of writing nell, if they could not that of fighting. From? court, the elegance and purity of the language ioon fpread itfelf into the provinces; and now there is fearce anybody there who does not write and feeak good French.

One of the characters of the French language is, to he natural and ealy. The words are ranged in it much in the fime order as the ideas in our minds; in which it differs excectingly from the Greek and Latin, where the inverion of the natural order of words is reputed a beauty. Indeed the Hebrew furpaffes even the French in this point; but then it comes mort of it in copiouliefs and variety.

It mult be added, however, that as to the analogy of grammar, and the fimplicity wherewith the moods of verbs are formed, the Englilh has the advantage not only over the French, but over all the known !anguages

## F R $\mathrm{E} \quad[227] \quad \mathrm{i} \quad \mathrm{i} \mathrm{F}$

Frocuti in the world; but then the turns, the expreflione, and the idioms of the Engith, are fometimes fo quaint and extraordinary, that it loles a gond deal of the adrantage which its grammatical timplicity gives it ower the rett.

The Freach has but few compound words; wherein it differs widely from the Gretk, High Dutch, and Englih. This the French authors own a great difadrantage in their language ; the Greek and Dutch dcriving a great part of their force and energy from the compolition of words, and frezuently expretting that in one founding word, which the liench cammet exprefis but by a periphrails. The diminutives in the Frencl are as few as the compounds, the greateit part of thofe remaining in wie having loit their diminutive fignification; but what diltinguilh the Trench moft, are its jutnef, purity, accuracy, and thesibility.

French is the mof univerfal and extenfive language in Europe. The policy of ftate, and courts has rendered it ncceflary for the miniters of princes, and their officers, \&ic. and the tatte of arts and ficienices has had the fame effeet with regard to the learned. In Germany, and elfewhere, the princelfes and pertions of dittinction value themfelves on underitanding French; and in feveral courts of Europe, French is almotl as much hnown as the language of the country.

FRESCATI, or Frascati, a fmall torm, fituated on the brow of a hill, about twe've miles to the eattward of Rome. It derives its name from the coonefs of the air, and $f r y b$ verdure of the fields around. It is built of the ruins of the ancient Tufculum; and the Tufculan villa where Cicero wrote his famous queftions is at a place now called Grotta Forrata, about two miles diflant. E. Long. II.43. N. Lat. 4 1.48. There is a very fine profpect from this town into the neighbouring country, which abounds with the feats of cardinals and other nobility. It is the fee of a bilhop, who is one of the fix fenior cardinals, and is furrounded by fone of the moft beautiful villas in Italy; the principal of which are the villa Aldobrandini, belonging to Prince Pamfili; the villa Taberna, belonging to Prince Borghefe ; and villa Ludoviti, to the family of Colonas. The villa Aldobrandini, called alfo Bil vedere from its beautiful profpect, is the moit remarkable, on account of its fine fituation, extentive gardens, airy terraces, its grottoes, cafcade, and water-work s. Oier a faloon, near the grand cafcade, is the following infcription:

> Ifuc , rao migrevi mufis comitatus Apsilo; Hic Delphil, lic Helicon, hic milhi Delor vit.

The walls are adorned with a reprefentation of Apollo and the Mu'es; and forme of that god's adsentures are painted in frefoo by D menichino. The villa Tabema is one of the finelt and bell furnilied of any in the neighbourhood of Rome. From this you atcend through g.ardens to Monte Dracone, another palace on a more iufty hituation, belonging allo to that prince, and deriving its name fron the arms, of his family. Irom l.ctire you may fee Rome, and the whole estent of the plain; it has a noble afcent, with a bruad praved walk; whdamg other curiontics there is a hatl wherned with the fiture of a vat namber of men emineat for hecning wad arm. The gardens, laid out by Vig. ola,
 place are the monks of Camaluli what the capuchins, and higher up are ruin of the :an io: I 1 titumas. Alcending ter aris the plam, tho miles as the rig' hand, you find tie tomon whey of Con't Fesat.. belongine to the mons of st B. it, and finted on the ruins of Cicero", home. The Virsim Ning of the great altar is an ancie ot Gecel ficture; i the chape the picures of St Nilus and Si Burtholonew the is bot, are by Amiial Caraci; and a:l the pantions is frefo of this chapel are by Domenclino. Viki Lee dovili has a charning walk going up to it, where you fee the ruins of Lucullu's palace. The hook is fnall; but the gardens are large, embellihind with a great variety of walks and foumains, and a beautiful cal cade.

FRESCO, a method of painting in relievo on wall, fo as to endure the wather. It is performed wibl water colours on freth platler, or on a wall laid with mortar not yet dry. This fort of painting has a grea: advantage by its incurporating with the mortar, and drying along with it, becomes very durable. The Italians, from whom we borrow the tirm, call it froios becaufe it is frequently ufed for wall, alcoves, and other buildings in the open air. Vitruvia, lib. vii. cap. 4. calls it udo tactorio.

Painting in frefoo is very ancient, having been prac tifed in the earlieft ages of Grecee and Rome. It is chierly performed on walls and vealts, newly platered with lime and fand; but the plafter is only to be laid, in proportion as the painting goes on; no more bein; to be done at once than the painter can defpatch in 3 day, while it dries. Before he begins to paint, a cartoon or defign is ufually made on paper, to be chalked, and transferred to the wall, about half an hour after the plater is applied.

The ancients painted on flucco; and we may remark in Vitruvius what infnite care they took in making the incrutation or plaftering of the ir buildings to render them beautiful and latting; though the modern painters find a platter of lime and fand preferable to it; tooth as it does not dry fo hattily, and as being a little browt. ih, it is fitter to lay colours on, than a ground fo white as itucco.

In this kind of painting, all the compound and artificial colours, and almoof all the minerals, are fet afide, and fearce any thing is ufed but carths; which are capable of preferving their coluor, dectendint it from the burning of the lime, and refitiont is, falt, which Vitravia calls its bittemef.

For the nork to come out in all its beauty, the colours mut be laid on quick, while the plather is yet moitt ; nor thould they ever be retouched dry, with colours mised up with the white of an egh, or tize, or gum, as fome worl men do; becate fach colours grow blackih; nor do any preferec thembelses, but only fuch as wete laid on hatlily at falt.

The colours wied are white made of ime thened hond lefore, and white martie dut: ochre, buth rad and sellow; verditer; lapis larali; Imolt; Lheck chath. \&c. Alf which are only grour al, and :: orhed up with w.ater ; and moll of them grow brighter i...id brighter ... the frefo drice.

The bather and penile for this work oaght to be
1ras

## F R E

Eiefh
long and foft, otherwife they will rake and raife the painting. The colours thould be full, and flowing from the brufh; and the defig: perfect: for in this work you cannot alter or add upon any colour.

FRESH water, is that not tinctured or impregnated with falt or faline particles enough to be difcovered by the fenfe. Such generally is that of fprings, rains, wells, lakes, \&c.

The dulcifying or making of falt water frefh is a fecret that has been long fought with great attention. For an account of the principal attempts that have been ruade with this view. See Sea Watfr.

Fre/bIIIND fignifies ftrong, but not violent ; hence when the gale increafes, it is faid to frelhen.

FRESHES, in fea language, denotes the impetuotity of an ebb tide, increaled by heavy rains, and howing out into the fea, often difcoluuring it to a confiderable dillance, and forming a line that feparates the two colourc, and which may be dilinctly perceived for a great length along the coat.

Freshes, a local term fionifying annual inundtion, from the river being fwollen by the melted fnows and other freh waters from the uplands, as is the Nile, \&c. from periodical or tropical rains. As a failor's term, it is oppofed to marine or falt water floodings, tidts, \&e. The word is of common ufe in America, where the inundations fo called are of gre it fervice. They bring down the foil to the intervals below, and form a fine mould, producing corn, grain, and herbage, in the molt luxuriant plenty. They alio afford another benctit, in regard to matry ivers in America, viz. in equalizing the furface of the ftream (where rapid falls, or cafcades, obitruct the navigation), to that rafts of timber and other grofs produce are then floated down to the fea ports in great quantities.

Fresnoy, Charles Aiphonse du, an excellent poet and painter, was born at Paris in 16if. He was inlructed there by Perrier and Simon Vouet in painting : but he did not long adhere to Vouet's manner of colouring; for as foon as he fixed himfcle at Rome, he made the works of Titian the models for his imitation. He was, however, more celcbrated as a poet than as a painter; and gave more attention to the theory than to the practice of the pencil. Accordingly, he is better known by his incomparable poem $D c$ arte sraplica, than by his performances on the canvafs: and on this poem he beftowed fo much pains, that be died in 1665 , before it was publifhed. It was printed afterwards with a French profe trantlation and notes by M. de Piles; and was tramated into Englifh by Mr Diyden, who prefixed to it an original preface containing a parallel between painting and poctry.

FRET, or Frittre, in Aichitequrc, a lind of knot or ornament, confifing of two lifts or fimall fillets vaioully interlaced or interwoven, and ruming at parallel diftances equal to their breadth.

Fret, in Heraliry, a bearing compofed of fix hars, crofled and variouly interlaced. Some call it the truehowe knot. Sec Ifraldidry.

Funt, in Mu/uc, lignibes a kind of ftop on fome infruments, particularly bafs viols and lutes. Frets confift of llrings tied round the neck of the inftrument, at ocrtain didances, within whi ? fuch and fuch notes are to be fend.

## 228 ] F R I

Fret. Work, that adorned with frets. It is fometimes ufed to fill up and enrich flat empty faces; but it is moftly practifed in roofs, which are fretted over with plafter work.

FRETTS, in Mineralosy, a term ufed by our miners to exprefs the worn fide of the banks of the rivers in mine countries, where they fearch foi the thoad ftones or grents walled down from the hills, in order from thence to trace out the running of the thoad up to the mine.

## Fretts, Freats, or Freits. See Freats.

FREYBERG, or Friedberg, a town in the circle of Upper Saxony, containing upwards of 60,000 people. There are mines of copper, tin, lead, and filver, in its vicinity, which afford employment to a confiderable number of workmen, and produce an amual revenue of more than 10,000 rix-dollars. The princes of the houfe of Saxony are ufually buried here, where there is alfo an academy for the ftudy of mineralogy, inllituted in the year 1765 , and reckoned the moil famous for that fcience of any in Germany. It is fituated on a branch of the Muldau, $1 ;$ miles fouth-weft of Drefden, in N. Lat. 51. and W. Long. 11. Iح.

FRIABLE, among naturalills, an appellation given to bodies that are eatily crumbled to pieces: fuch are pumice and all calcined itones.

FRIAR, or Frier, by the Latins called frater, the Italians fia, and the French frere, that is, brothor: a tcrm common to the monks of all orders; founded on this, that there is a kind of fraternity or brotherhood prefumed between the feveral religious perfons of the fame convent or monaflery.

Friars are generally diftinguihed into thefe four principal branches, viz. 1. Minors, Gray friars, or Francifcans. 2. Auguilines. 3. Duminicans, or Black frias. 4. White friars or Carmelites. From thefe four the reft of the orders defeend. See Financiscans, Augustines, \&c.

Friar, in a more peculiar fenfe, is reftrained to fuch monks as are not prietts ; for thole in orders are ufually dignified with the appellation of father.
$F_{\text {RIARS }}$ Obfervant (fratres obfervantes), were a branch of the Francifcans; thus called, becaute not combined together in any cloitter, convent, or corporation, as the conventuals are ; but only agreed among themfelses to obferve the rules of their order, and that more flrictly than the conventuals did, from whom they feparated themfelves out of a fingulanity of zeal, living in certain places of their own choofing.

FRIEURG, a large town of Germany, and capital of Brifgaw ; remarkable for the fleeple of the great church, which, next to that of Strabburg, is the finell in Germany ; and for its univerfity. The inhabitants are famou, fur polifhing eryftal and precious tones. It has been feveral times taken and retiken; particularly by the French in $17+$, who demolined the fortifications. It was alfo taken by them in Iune r796. It is feated on the river Trifet, ten miles caft of Brifach, and 26 fouth of Strafburgh. E. Long. 7. 57. N. Lat. $4^{8} .4$

Friburg, a town of Swilierland, and capital of the canton of the fame name, feated on the river Sane, in E. Long. 7. 5. N. Lat. +6. 50. Its fituation is $C_{\text {cexis }}$ moil fingular and piclurefque: "It flands partly Trawols in $^{S_{z} \text { itacro }}$ in a lmall plain, partly on told acclivities on a sand.

## F R I [ 229$] \quad \mathrm{F} \quad \mathrm{R}$ I

Friburg, fidge of rugged rocks, half encircled by the river Fricafte. Sane; and in to entirely concealed by the circumjacent hills, that the traveller ficarcely catches the fimallett glimple, until he burfs upon a view of the whole towia from the owerbanging eminence. The furtification, which conilit of high ftune walls and tower, enclute a circumference of about four miles, whin which fipace the eye comprehends a lingular misture of houles, roch-, thiclets, and meadows, varying intantly from wild to avreeable, from the buile of a town to the folitude of the deepent retirement. The sime winds in fuch a ferjeatine manner as to form in its courie, within the fpace of two mile, five obtale angles, between which the intervening parts of the current are parallel to each other. On all fides the delcent to the town is extremely fleep: in one place the itreets even pafs over the roofs of the houles. Many of the edifices are ratied in regular gradation like the feats of an amphithestre; and many overhang the edge of a precipice in fuch a manner, that on looking down, a weak head would be apt to turn siddy. But the mofl extraordinary point of view is from the Pont-neuf. To the north-wefl, part of the town tlands boldly on the fides and the piked back of an abrupt ridge; and from eath to weft a femicircle of higb perpendicular rocks is feen, whofe bafe is wathed and undermined by the ninding Sane, and whote tops and fides are thinly feattered with hrubs and undervcod. On the highett point of the rocks, and on the very edge of the precipice, appears, half hanging in the air, the gate of the town called Bourguillon: a ilranger ftandky on the bridge would compare it to Laputa, or the Flying Inland in Gulliver's Travels; and would not conceive it to be accelifle but by means of a cord and pulleys. The houfes, conftructed with a gray fand flone, are neat and well buit; and the public edifices, farticularly the cathedral, are extremely elesant. The inhatitants are Roman Catholics, as are thole of the whole canton. The bihop of Lafanne, called here the tihop of Friburg, rendes in this city. He is apfinted by the pope, fually at the recommendation of the French court; and his revenues, incluting a fmall pention from Trance, and from the abbey of Haterive, of which he was abbot, amount to about +20 . per antrum. His diocele extends over the whole canton, and part of that of soleure. In all his aits and deeds he figns limfelf bifhop and count of Laufanne, and prince of the German empire. The fovereign poner refides in the great council of two hundred: comprifing the two adroyers, the chancellor, the grand fautier, the fenate or little council of twenty-fur, the lixit, from which body are choten the bannerets and principal magiffrates, and the remaining handred and twelve members, who are fimply deaminated burghers."

Fribitige, canton of $f$ one of the 1 a republics of Switzerland. It is furrounded on all fides by the cantun of Bern. The land is fertile in corn, fruits, and pattures; and it is faid the canton can fend $18,0=0$ men into the field. This catoton is entirely Catholic.

FRICASSEE, a dilh or mefs hatily drefled in a fryigg pan, and feafoned with butter, oil, or the like. The word is French, formed of the Latin frizatura, " frying." Others will have fricaffe formed in imitasion of the noife made by butter, or vilser fat, when faclted in the pan. We fay a rise:nfee of pullets, of
rablits, of tench, ư tije, of foos, of crö, (f peas, Friten', \&

FRICENTI, an epifornal tome of Italy, in the $\underbrace{\text { - }}$ kigglons of Naple, and in the farther pincipato, near th: river 'ripato, in E. Lomg. 1 + . 13. N. L.tr. $\ddagger$. 59.

IRICTION, the ate of rulling or gratine the furface of ous body again that of another, called atio attrition. The phenomena aring upon the fiction of divers bodies, under dillerent circumbabes, are bey numerou and confiderable. My Hhmbllee give un : number of experiment of this kind ; particulaly with attation or friction of glafs, under wions circurnan ces, the relult of which was, that it yiched lisht :.nt became electical. All bodies by fricion proluce heat ; many of them emit light; particularly a cat* bat., fugar, beaten falphur, meacury, fea water, gold, cop per, \&c. but, above all, dimond, which, shen lrifk ly rubbed againt glali, gold, or the like, yiedd a lin: equal to that of a live coal when blowed by the Lellow See Ellectrics and Eifftikietty.

Priction, in Machatice, denotes the refinatace a moving body mets with from the furface on which is moves. Friztion arife, from the roughnels or afpenty of the lurface of the budy moved on, and that of the body moving: for fuch furfaces confiting alturnately of eminences and cavitics, eithe the eminences of the one mutt be railed over thofe of the other, or they mut be boh broke and wom off; but neither can happen without motion, nor can motion be produced with. out a furce imprefled. Hence, the force applied to move the body is either wholly or partly fpent on this effict ; and confequently there arifes a refiftance or friction, winch will be greater, cathris paribus, as the eminences are the greater and the fubltance the harder: and as the body, by continual friction, becomes more and more polithed, the friction diminilies. See Me. chanics.

Friction, in Medicine and Surgory, denotes the act of rubbing a difeafed part with oils, tinguents, or other matters, in order to eafe, relieve, and cure it. Fric tions are mach uled of late in venereal cales. Thes prefer the appising of mercury externally by way of friction, to that of giving it intemally, to raich a hifivation.

There are alfo frictions with the flell brath, a linem cloth, or the band only. Thefe frictions are a for of exercife which contributes greatly to health; st they excite and ilir up the natural warmth, divert dethvion . promote perfpiration, open the pores of the thi:,... it carry off flagnant hunours.
'The tlelh brufh (Dr Cheyne obfertco' is an am: extremely uffeful for promoting a full and free peffi. tion and circulation. Every body knows the cife: of currying horkes; that it make them lieck. lively, and active; fo as even to le judged enus... . : to half the feeding. This it can no witherwile ctic. i. but by affilting nature to throw ofl the reeremene a the juices, which Hop the free circulation, and. i: conftant friction, irritation, and flimul tion, wh \& \& blood and fpirits to the parts moll diftut thosti it feat of heat and motion; and fo plump up the that: ficial mufeles. And the fame effect it would h: other creatures, and man himfelf, if manated in :i fame mamer, and with the fame care and regalof

## F R I［ 230 ］F ll I

Perions，thenefore，of weak nerves and fedentary hives， would do well to fupply the want of other exercic with fpending half an hour，worning and night，in currying and rubbing their whole budy，cfpecially their limbs，with a flein bruh．But this means of heaths is moft advantageoully uled when the prime vict are moft empty．

FRIDAI，the fixth day of the weel；fo named of Frcla，a Saxon dety．By the Romans it was called die＇s l＇eneris．See Frea．

Gurd－Fkidar．See Good－Friday．
ERIDSTOL，mentioned，in our ancient wriers， among the immunities granted to churchos，fignilies a cat，chair，or place of peace and fecurity，where cri－ minals might find fafety and protection ：of theie there were many in England；but the molt famous were that ot Beverly，and that in St Peter＇s chureh at York， granted by charter of King Henry I．

FRIEDENSHUETTEN，a Moravian fettlement whofe name fignifies tents of peace，fituated on the Suf－ quehannah river in Penniflvania，about 24 miles below Tioga peint，which owed its origin to the united breth－ ren，in the year 1765 ．At that period it contained 13 huts belonging to the Indians，befides to houfes con－ firucted after the European manner，and a very neat chapel．

FRIENDLY islands，a clulter of illands in the Pacific ocean，fo named by Captain Cook in the year I－73，on account of the friendinip which apppeared to fubiilt among the inhabitants，and from their courteous behaviour to ftrangers．Abel Janien Tafman，an e－ minent Dutch navigator，firt touched here in 1643 ， and gave names to the principal inlands．Captain Cook laborioully explored the whole clutter，which he found to confit of more than 60 ．The three inlands which Tafman faw he named New Amferdam，Rotterdam，and Midd／burgh．The firt is the largeit，and extends about 21 miles from eatl to welt，and about 13 from north to fouth．Thele inlands are inhabited by a race of Indians，who cultivate the earth with great induf－ try．The illand of Amperdam is interfceted by a itraight and cleafant roads，with fruit trees on each fide，which provide thade from the forching heat of the fun．The chief illands are Annamooka，Tongataboo（the refi－ dence of the fovereign and the chiefs），Lefooga，and Eooa．Lefooga is about feven miles long，and in fome places not above two or three broad．It is in many refpects fuperior to Ammmooha．The plentations are both more numerous and more extenfive；and en－ clofed by fences which，running parallel to each other， form fine facious public roads，which would appear beautiful in countries where rural conveniences have been carried to the greatcll perfection．They are，in general highly cultivated，and well fonched with the leveral roots and fruits which thefe inlands produce； and Captain Cook endeavoured $t 0$ add to their num－ leer by planting Indian com，and the feeds of melons， pumpkins，and the like．Eooa，when viewed from the ilip at anchor，formed one of the motl beantiful profpect in nature，and very diferent from the others of the Miendly Mles；which being low and perfectly ：evel，ahibit nothing to the eve Lut the trecs which cover them：whereas here，the land rifing gently to a confiderable height，preferth us with an extenfive srofpest，where groves of trees are only interfperfed at
irregular ditanees，in beautiful diforder，and all the Fruerd： relt is covered with grals，except near the llores，where it is entirely covered with fruit and other trees；amonght which are the habitations of the natives．In order to have a view of as great a part of the illand as pof－ fible，Cuptain Cook and fome of hiv othicers walk－ Cd up to the higheit point of the illand．From this phace they had a view of almoft the whole inand， which confitled of beautiful meadows of prodigious ex－ tent，adorned with tufts of trees，and intermised with plentations．＂While I was furveying this delightful profect days Captain Cock，I could wot help tietter－ ing myfelf with the pleanigg idea that fome future na－ vigator may，from the fame fation，beheld thele mea－ dows fleched with cattle，brought to thefe iflands＂by the thips of England；and that the completion of this fingle bencvolent purpofe，independent of all other con－ fiderations，would fufficiently mark to polerity，that our voyages had not been wetefs to the general inte－ refls of humanity．＇The next morning，＇fays our be－ nevolent commander，＇I planted a pine apple，and fowed the feeds of melons and other vegetables in Taoofa｀plantation．I had indeed fome encourage－ ment to shatter myfelf that my endeavours of this kind alfo would not be fruitlefs；as I had this day a dilh of turnips ferved up at my dinner，which was the produce of feeds I left here in my former voyage．＇

The natives of thefe iands feldom exceed the com－ mon ftature ；but are very ftrong and well made，cfpe cially as to their limbs．They are generally broad about the thoulders；and though the nufcular difnofi－ tion of the men，which feems a confequence of much action，rather convers the appearance of itrength than of beauty，there are feveral to be feen who are really handfome．The nomen are not fo much diftinguilhed from the men by their features as by their general form，which is for the moft part dettitute of that ftrong fielly firmnefs that appears in the latter．The features of Come are fo delicate，as not only to be a true index of their fex，but to lay clain to a confi－ derable thare of beauty and expreffion：for the bodics and limbs of motl of the females are well proportion－ ed；and tome abfolutely perfect models of a beautifu！ figure．But the motl remarkable dillinction in the women is the uncommon fmallness and delicacy of their fingers，which may be put in competition with the fincit in Europe．The general colour is a catt deeper than the copfer brown；but feveral of the men and women have a true olive complesion：and fome of the laft are even a great deal fairer．Their countenances very remarhably exprefs the abundant mildnefs or good nature which they poffefs；and are entirely fret from that favage heennefs which marks mations in at burbarus tate．They are franh，cheerful，and good nature $\dot{c}$ ．

There are，upon the whole，few natural defects or deformities to be found amongit thefe people．The moft common is the tetter or ring worm，that feem to af－ fect alonott one half of them，and leaws ulatifh fer－ pentic matks everywhere behind it；bur this is of let colfoquence than another which is very frequent， and appears on every part ut the body．Cijtin Cuok had $t:$ nottifeation to tearn that all the catc le took when he tiat vilitad thale illand．，to prevent the vene－ ral difate from being cotamanicated to the inhabi－

## 

Frierfly taints, had proved ineffectual. What is extracrdinaty, Ihan?. they do not feem to regard it much; atd an thew ap.
yeared few lignt of it datroying effe to, probstiv the climate, an l the way of living of tiene people, great. If stated its vinkence. There are tw mher complanis, fie puent amongt them; one of which is an indulent firm faclling, that aticets the legs and arms, and increates them to an extraur linar: fize in their whole leng'th. The other in a temor of the fame fort in the teticle, which inmtimes exceeds the fize of the two fifls. Eut in other refipects they may be contidered as uncommonls healihy.

Their hair is in coneral praight, thick, and ftrong, though a few have it buhy or frizzled. The natura! colour is blach; but the greatelt part of the men, and fime of the women, hase it Ifined of a brown or parple colour, and a few of an orande cati. They sear it varomly cut. Some hase it cut oft on one fide of the hea! only; whers have it entirely cut of evept a lingle luch; the women in generil wear is thort. The mes hase t' ir beards cut thort ; and both $m$ and women ftrip the hair from the armpis. The men are thained from about the middle of the belly to about half way down the thighs with a deep bhe colour. The women have only a few imall liass or fpots thas imprinted on the infice of their hand. Their hiags, as a mar's of ditinction, are cxempted from this cullom.

The men are all circumcifed, or rather fupercited, as the operation conalts in cutting of only a fmall piece of the toreakin at the upper part: which by that means is readered incapable ever after of cosering the glans. This is all they aim at, as they fay the epera:ion is prastifed from a notion of cleanlinef.

The drefs of both men and women is the rame: and conitts of a piece of cloth or matting (bet monly the former) about two yards wite and two and a halit long : at leat to long as to go once and a half round the wain, to which it is confined by a gitdle or cord. It is doubie before, and hangs down like a petticuat, as low as the middle of the leg. The upper part of the garment above the gitdie is plaited into feveral folds; fo that, when untolded, there is cloth luticient to draw up and wrap round the thouldens; which is very leldom done. The inferior luat are fatisfied with fmall pieces; and very often wear nothing but a covering made of leaves of plants, or the maro, which is a narrow piece of cloth or matting like a fah. This they pals between the thighs and srap round the wait; but the ufe of it is chielly confined to the men. The ornaments worn by both fexes are necklaces, made of the frout of the pandanus, and various fweet fmelling flowers, which go under the gencral name of tahulia. Other: are compofed of imatl hat ll, the nines and leg-bones of obirds, hark-teeth, and other thing.; all which hang loofe upg the breall; rines of tortoik fhell on the fingers; and a number of thele joined together as bracelets on the wrills. The lobes of the cars (though mont frequently only ore), are fometimes perforated with two hole, in which they wear cylindrical bits of ivory about threc inches long.

Cleanlinefs induces them to bathe in the ponds, whieh feem to ferve for no other purpole. They are lentible that fait water harts their fkin; and when neceflity oblig. Some cucoa ratthells slled with feelt water juwed oise
 ant oit, which imprece the appearance of the thin illanto. very r.ats.

The can ! ymant of the somen in of the eafy kind, and, for the nont fart, luch an may be executed in thas houde. 'The mandactume their cluth is wholly cons figned to theis cate; as is alfo that of theit mats, whicit are ciecmed buth for their tevture and their beatut There are many other articles of lef wote that emplo: the fare time of their females; as combs, of which the: mane wat numbers, and little batkets with mall beade: but all finithed with fuch neatnefs and tatte in the dil. potition of the various parts, that a flanger cannot hel $p^{2}$ adnining their amdurty and destecity.

The prosince allotted to the men, as might be ex. pected, is far more labonious and extenfise than that of the women. Agricature, architecture, boat buid in, mhing, and other things that relate to navigution, are the objects of their care. Culivated root and fruits being their principal fipport, this recquire: $t^{1}$ is condant attention to agiculture, which the patia very diligently, and feem to have brought aimof to as great perfection as circumbtances will permit. In planting the plantains and yams, they obierve to much evactuefs, that, which ever way you look, the rums peient themielvelves regular and complete. The cocoa nut and bread fruit trees are fattered about without any order, and feem to give them no trouble after they have attained a certain height.

The houles of the lower people are poor huts, and very fimall; thofe of the better fort are larger and more comfortable. The dimentions of one of a middhng fize are about 30 feet long, 20 broad, and 12 high. Their howe is, propenly freaking, a thatched root or thed, fupperite by poits and rafiers, difpoted in a very judicion maner. The thoor is rafied with cartl: fmocihed, and covered with ilrong thich matting, and lept very clean. A thick Atrong mat, about two and a half or three feet broad, bent into the form of a femicircle, and fet upon its edge, with the ends tuching the frde of the houle, in thape relembling the fender of a fire hearth, enclofes a face for the mather and mitrels of the family to lleep in. The relt of the family tleep upon the thor, wherever they pleafe to lie down; the unmarried men and women apart from each other: Or if the family be large, there are fmall huts adyoining, to which the fervants retire in the night; to that privacy is as mach oblerwed leere as ore conld exject. The clothes that they wear in the day ferve for their covering in the night. Theis Whole furniture confids of a boul or two, in which they nake kava; a fes gourds, cocoa nut lheik; and fome finall wooden thools, which ferse them for pittors.

They difplay much ingenaity in the building of theis canoes, as well a in the navigating them.

The only tools whith they ufe to contruct them, which are very devterotil? made, are hatchet, or rather thick adze, of a fmooth black itowe thit abounds at Tootion; augre, made of thark tect?, fined on finetl handles, and rat a of a roughí kin of a fith, fatt ened on that pieces of wood, thinner on one fide, which alis have handles. The coritas is made from the fibres of the cocos mut hatl, w!ifh, thor, hout mose thata nine or eca incles long, they phit, about the kiee of
$\tau_{r} . \%^{*}$ anill, or lef, to any length that they pleafe, and Mlands. roll it up in balls, from which the larger ropes are made by twilting feveral of thefe together. The lines that they finh with are as ftrong and even as the beft cord we make, refembling it almoft in every refpect. Their other filhing implements are laige and fimall hooks made of pearl thell. Their weapons are clubs of different forts, (in the omamenting of which they if end much time), fears and darts. They have allo bow and arrows; but thefe feemed to be detigned only for amufement, fuch as thooting at birds, and not for military purpofes. The ftools are about two feet long, but only four or five inches high, and near four broad, bendirg downward in the middle, with four itrong legs, and circular feet; the whole made of one piece of black or brown wood, neatly polithed, and fometimes inlaid with bits of ivory.

Yams, plantains, and cocoa nuts, compofe the greateft part of their vegetable dict. Of their animal food, the chief articles are, hogs, fowls, filh, and all forts of thell filh; but the lower people eat rats. The two firft vegetable articles, with bread fruit, are what may be called the bafis of their food, at different times of the year, with fill and thell fint; for hogs, fowls, and turtle, feen only to be occafional dainties, referved for their chiefs. Their food is generally drefled by baking, and they have the art of making, from different Linds of fruit, feveral difhes which moft of us effeemed very good. The generality of them lay their victuals upon the firf leaf they meet with, howerer dirty it may be; but when food is ferved up to the chiefs, it is commonly laid upon green plantain leaves. The women are not excluded from eating with the men; but there are certain ranks or crders amongit them that can neither eat nor drink together. This dillinction begins with the king; but where it ends could not be learnt. They feem to have no fet time for meals. They go to bed as foon as it is dark, and rife with the daw in the morning.

Their private diverfions are chiefly finging, dancing, and mufic performed by the women. The dancing of the men has a thoufand different motions with the hands, to which we are entire ftrangers; and they are performed with an eafe and grace which are not to be defcribed but by thofe who have feen them.

Whether their marriages be made lalting by any kind of folemn contract, our voyagers could not determine with precifion ; but it appeared that the bulk of the people fatisfied themfelves with one wife. The chiefs, however, have commonly feveral women, though it appeared as if one only was looked upon as the miftrefs of the family.

When any perion of confequence dies, his body is walhed and decorated by fome woman or women, who are appointed on the occafion; and thefe women are not by their cuftons, to touch any food with their hands for many months afterwards; and is is remarkable, that the length of the time they are thes profrribed, is the ereater in proportion to the rank of the chief whom they had wathed.

The concern of thefe people for the dead is mon evtraordinary. They beat their teeth with ftones, ilrike a thark's tooth into the head until the blood tlows in ifreams, and thruit ifears into the inner part of the thigh, into their fides below the armpits, and
through the cheeks into the mouth. All thefe ope- Frienilt rations convey an idea of fuch rigorous difcipline, as nlands. mult require either an uncommon degree of affection, or the groffelt fuperflition, to exact. It fhould be obferved, however, that the more painful operations are only practifed on account of the death of thofe moit nearly connected.

Their long and general mourning proves, that they contider death as a very great evil. And this is confirmed by a very odd cultom which they practile to avert it. They fuppole that the Deity will accept of the little finger, as a fort of facrifice efficacious enough to procure the recovery of their health. They cut it off with one of their itone hatchets. There appeared fearcely one in ten of them who was not thas mutilated in one or both hands. According to Captain King, it is common allo for the inferior people to cut off a joint of their little finger on account of the fichnefs of the chiefs to whom they belong.

They feem to have little conception of future punifhment. They believe, however, that they are jullly punithed upon earth; and confequently ule every method to render their divinities propitious. The Supreme Author of all things they call Kallafootonga; who, they fay, is a female refiding in the $\mathbb{A k y}$, and directing the thunder, wind, rain, and in general all the changes of weather. They believe that when the is angry with them, the productions of the earth are blatted; that many things are dettroyed by lightning ; and that they themfelves are aflicted with ficknets and death as weil as their hogs and other animals. When this anger abates, they fuppofe that every thing is reftored to its natural order. They alfo admit a plurality of deities, though all inferior to Kaliafcoronga. They have lefs ablurd fentiments about the immateriality and the immortality of the foul. They call it life, the living principle; or, what is more agreeable to their notions of it, Orooa; that is, a divinity or invifible being.

Of the nature of their government no more is known than the general outline. According to the information received, the power of the hing is unlimited, and the life and property of the fubject are at his difpolal ; and inftances enough were feen to prove that the lower order of people have no property, nor fafety for their perfons, but at the will of the chiefs to whom they refpectively belong. When any one wants to fpeak with the hing or chicf, he advances and fits down before him with his legs acrofs; which is a potture to which they are fo much accuttomed, that any other mode of fitting is difagreeable to them. To fpeak to the king ftanding would be accounted here as a ttriking mark of rudenefs.

Though fome of the more potent chiefs may vie with the king in point of actual pollellions, they fall very thort in rank and in certain marks of refpect, which the collective body have agreed to pay the monarch. It is a particular privilege annexed to his fovereignty, not to be punctured nor circuncifed, as all his fubjects are. Whenever he walks out, every one whom he meets muft fit down till he has pafled. No one is allowed to be over his head; on the contrary all muft come under his feet ; for there cannot be a greater outward mark of fubmillion than that which is paid to the fovereign and other great people of thefe illands

## Fr I [ 233 ] F R I

Fiesibnep. by their inferiors. The method is this: the perion who is to pay obeifance fquats down before the chief, and hows the head to the fule of his foot; which, when he fits, is fo placed that it cannot eafly be come at; and having tapped or touched it with the under and upper ide of the fingers of both hands, he rifes up and retires. The hands, after this application of them to the chiee's feet, are in fome catios rendered uleief for a time; for, until they be walhad, they mull vot touch any kind of fuod. When the hands are in this Itate, they call it taboo roma. Taboo, in general, fisnifies ". forbidden," and rema is their word for " hand." Their great men are fond of a fingular piece of luxury; which is, to have women fit befide them all night, and beat on dikerent parts of their body until they go to fleep; fiter which they relax a little of their labour, unlets they appear likely to awake; in which cafe they edoubte their drumming until they are again fat atleeo.
ment fu mate finting between two perions. and arining, not merely from the general principle of venevolence, from emotions of gratitude for favours recesed, from views of interelt, or from inflinctive affetion or arimal palfion; but from an opinion entertained by each of them, that the other is adorned with fome amiable or refpectable qualities.

The object of the general principle of benevolence Illuration is mankind, not any particular individual. Gratitude
but that nhich lows from this pure fource mula be Fineni noble and sirtuous. When tiso perfons of virtue and abilities comemplate each the other's character and conduct, they cannot but wiew thens with complacency and cticen. 11abits and ations difplaying prudence, fortitude, moderation, interity, benevolence, and piety, naturally command the approbation of the impartial fuectator, sied even affect him with delight. But as we are difpuied to revilit a landleape the beanties of which wo have contemplated with rapture, and read with frequent delight a poem in which genius ba faithfully delineated fome of the mot enchanting lecnes or the monl interetting events in nature ; fo we alfo become defirous to enjoy frequent opportunities of contenuplating a character dilinguithed for eminent abilities and illuftrious virtues. The lociety of fuch a perfon is preferred to his who is difgraced by the onpolite qualities. Hence, whenever men of truly refpectable characters enjoy opportunities of mutual intercourle, an attachment naturally takes place between them; entirely dininteretted, and founded lolely on the approbation with which the one camot avoid regarding the conduct of the other. 'The eiteem which the ore is thas induced to entertain for the other will lead them to leck frequent opportunitios of engosing each other's fociety, mutually to ath ami liten to advice, to trut their molt lecret and important purpole to each uther's confidnce, and to be no lefs concerned each of them for the other*, interelt and honour than for his own. This, and this alone, is genuine friendthip; founded on virtue, and on that approbation which virtue never fails to conmand: it is a natura! confequence of intercourle betheen virtuous men.Where it is once eftablihed, it cannot die, while thofe virtues to which it owes its origin continue to adom the perfons between whom it fubhits.

But, perhaps, luch a pure and fublime attachment circumcan farce be expected to exit amons beings of foftences $S_{3}$ mixed and imperfect a character as manhind. The vourdble to wife man of the ancient Stoic:, or the Chrition who the rife amis fully obeys the precepts and follows the fleps of hisancerif Saviour, might be capahle of it ; but, unfortunate!y, rim nt ?s. hamanity never reaches fuch perfection. Virtue and vice are fo blended together in every human character. that while none is fo worthlefs as to excite no other fentiment but abhorrence, there is icarce'y any fo uniformly virtuous as to command unvaried eiteem or ad miration. Even the purell and moll difinterelted of thofe triendihip which prevail among men, owe their origin to other meaner principles, as nell as to that which has been mentioned as the principle of genume friendfhip. There are certain ciscumftances lasourable, and whers advelfe, to the furmation and continunace of triendhlip. Thefe, making amend, as it weic, for the imperfection of human virtue and humais howledge, lead men to overluok each vother's faults and follie, and to unie in the bond of friendihip; a tritidhimp which, though lefs rolid, lefs enerous, and k!'s lati:g, t'on that whin we have atove deicribed, is yet attended with eflecis farourable to the happineis of indi, iduals, and to the interefts of fociety in geeeral.

Siualuig of $a, c$ is faw curabie to fricndhip. Infancy, ratreol, and old age, differ fo condiderably from cach over if their view, pallons, and purfuits, that the hay will fedom be dipoted to afforiate with the by Cg

## F R i $[2 j t] \quad \mathrm{F} \quad \mathrm{R}$ I

 exprivice in the world with himfelf; and the oid man will generally wih for th:c company of fome ancient riend wit' whom he may Speak of "the days of former years."

They who cultivate the fame trade or profe/ion, enjoy opportunitits favourable to the formation of friendthip. Feing engaged among the fame objects, and acquiring flill in the fame arts, their knowledge, their fentiments, and habits, are nearly the fame : they cannet avoid frequent intercourfe with each other; they naturally enter into each other's prejudices and views, and therefore cannot but take pleafurc in each other's converfation and fociety. Phyficians, lawyers, and divines, form each of them a diftinct body; and the members of each of thofe bodics affociate with one another more readily than with men of a different profeffinn. It is related by Swift or Additon, that, in the seginning of the prefent century, there was a particular coffeehoufe in London which clergymen ufed to frequent, and that a fon of the church icarcely ever ventured to thow his head in any other. In the days of Dryden, poets, and all who pretended to poetical genius or tafte, reforted to Will's, as to another Parnallus, to fip cups of coffee, and now and then perhaps to drink of fome more infpiring liquor, inttead of the waters of the fountain Hippocrene.

Equality of rank and fortune is alfo favourable to friendhip. Seldom will a man of fottune be able to gain the fincere fiiendliip of any of his dependants. Though he treat them with the moft obliging condefcenfion, and load them with favours; yet ftill, either the fenfe of dependence, or refentment for imaginary injuries, or impatience of the debt of gratitude, or bone other fimilar reafon, will be likely to prevent them from regarding him with cordial affection. Servants are tut rarely faithful even to the moft indulgent mafter: Shakefpeare's old Adam is a very amiable but a very uncommon character. Indeed you may as foon expect to find the virtucs and the generous courage of the chevalier Bayard among our military men of the prefent age, as to find an old Adam among the prefent race of lervants. It is no lefs vain for the poor man to hope to acquire a fincere friend among his fuperiors is rank and fortune. The fuperior is generally dilgofed to cxact fuch profound deference, fuch gratitude, luch refpect, even from the inferior whom he admits into his intimacy, that the equal amicable intercourfe of friendthip can farce ever take place between them. Among the letters of the younger Pliny, we are pleafed to find many monuments of the goodnefs of his heart. I number of his epittles addrefied to friends in meaner ircumftances appear to have been accompanied with aery confiderable prefents, which by his opulence he was well enabled to beftow. But he takes care to 'et thofe humble friends know the weight of the obirgations which he conferred, and the valtnefs of the debt of gratitude which they owed to him, in fuch plain, nay even indelicate terms, that though they might receive bis favours with gratitude and regard him as their benefactor, yet they could never regard him as a man with whom they might cultivate the free eafy intercourfe of friendhip. Some one or other of the Greek writers mentions a fingular inflance of cordial friendihip fubfiling between two perfons in
unequal circunfances. One of them dying betore Friendim. the other, and leaving a wife and daughter to whom he had no fortune nor even means of fubfilience to bequeath, enjoined his rich friend, in his will, to take the charge of them on himelf, and to fupport them in a liberal manner : nor did he entreat this from his humanity, but demanded it from his fiendhip. He had made a fure provifion for his family. His rich friend delayed not to comply with his dying injunction. He readily took upon himelelf the charge of the wife and daughter of his deceafed friend, treated them with kindnels, and at laft divided his whole forme equally between his own only daughter and the child of his friend. This is an agreeable intance of the power of friendfhip: but fuch inftances are not to be expected to occur frequently in ordinary life, any more than the Stoic virtue of Cato, or the modelt piety of a Nelfon.

Similarity of tafte and temper will generally be found favourable to friendihip. Two peevih men, indeed, will not long endure each other's company with much fatisfaction; but two perfons of mild, humane difpofitions will naturally take delight in each other's fociety and converfation. They who are charmed with the bultle of a gay and active life, avoid the haunts of the indolent and contemplative, and join hand in hand to climb the heights of ambition, or tread the round of amufement and dilipation. Thofe whom talte leads to cultivate the elegant objects of literature amid the fivects of a rural retirement, to wander through the grove, or recline on the brink of fome romantic rill, and perufe the pages of one of thofe geniufes who have fhown themfelves able to enlighten the underflanding, and to kindle the glow of generous fentiment in the breatt;-thofe children of tatte frequently aflociate in their elegant purfuits. We are pleafed to read the correfpondence of Pliny and Tacitus, of Locke and Molineux, of Swift and Pope. We rejoice to find, that notwithftanding the rivalry of learning and genius, tafte and philofophy have a natural tendency to promote benevolence and friendihip among their votaries. The buffle of the world muit be acknowledged to be generally unfavourable to friendihip. When the heart is occupied with the fordid objects of ambition, or avarice, or gay diffipation, there is no room left for the pure and generous fentiments of friendfip. Interelts often interfere, compctitions and jealoulics arife, fatal to all the fweets of locial intercourfe. It is in active life that virtue hines with the molt brilliant luitre; but feldom, alas! does pure virtue appear in the fcenes of active life. How beautifully does the character of Atticus thine amid the characters of his illultrious cotemporaries ! ut Luna inter minores ignes! Sylla, Cafar, Ciccro, Brutus, Antony, and Auguftus, were cminent for their abilities and virthes; but being engared in the buftling purfuits of ambition, they feem to have been ftrangers to the calm and elegant happinels which Atticus enjoyed. Though thofe of them who nere cotemporaries could not avoid perceiving and admiring each other's merits, yet never did cordial fricudihip fubfift between them. Even Cicero, who could to well detine the dutics and defribe the happinefs of friendihip, yet appears to have but feldom enjoyed its delights. But Atticus, who contlantly declined entering the fecnes of rublic

## F R I $\left[\begin{array}{lll}235 & \text { F R I }\end{array}\right.$

Friet:1hip. life, experienced fuch happinefs in a private condition, as mut have been more than an ample reward to him for thunning all the fplendid purfuits of ambition. He was the difinterefled friend of all thofe eminent men, and enjoyed their efteem and friendihip. So upright was his character, fo amiable his mamers, that they who were mortal enemies to each other, yet agreed in cultivating at the fame time the finendilip of Atticus. None of them appear to have hated him on account of his attachment to their enemies: and while he was the friend of Cicero and Oclavius, he was at the fame time the protector of the wife of Antony. Perhaps the virtue of fuch a character may be regarded as problematical. It may be alleged, that while fuch inveterate diffenfions arofe among his friends, the neutrality which he preferved was inconfiftent with integrity. He has indeed been rathly branded by fome writers as an avaricious time-ferving man. But no evidence appears to juilify their aflertions; on the contrary, the moft refpectable teakony, the niceft forutiny, exhibit his character in thofe amiable colours in which we have chofen to view it. Atticus is indeed no ordinary character. The general principles of human nature, and the examples which moft frequently occur in the world, naturally fuggell a fufpicion, that had he been a man of genuine integrity, he mull have obferved a different tenor of conduct. But there is one circumfance which tends to ftrengthen confiderably the refpectable teltimony of his cotemporaries in his behalf. In Cato, in Epictetus, in the plilofopher, who, while fuffering under all the violence of an acute dillemper, maintained to Pompey that pain was no evil, we have inllances of the tenets of philofophy oppofing and reprefling the principles of nature. We know how often religious enthufiafin has produced the fame effects. But Auticus was the votary of the mild and elegant philofophy of Epicurus; which, though there appears to have been a palpable inconfiftency between its principles and the fuperflructure raifed upon them, was yet in its general tendency not unfriendly to virtue, and recommended to its votaries that calm and innocent mode of life which Atticus cultivated. There is no fimall refemblance between the character of Atticus and that of Ef icurut, the founder of this philofophy. The fame tenets feem to have produced the fame effects on both; and we will venture to pronounce fo high an encemium on the Epicurean philclophy, as to afiert, that it chierly contributed to form the character of this amiable Roman.

We know not if we may venture to affirm, that friendthips are moft naturally contracted among perfons of the fame fex. We believe they often are. If fimilarity of tafte, of fentiments, of manners, be favourable to friendthip, this cannot but happen. The difinction which nature has eftablikhed between the two feies, the new diflinctions which are introduced by the different views with which their cducation is ronducted, and the diflerent duties which they are called to perform in life, have all a tendency to difpofe men and women to enter into babits of intimacy with perfons of their own fex rather than with the wher. Young girls have their peculiar amufements, as boys have theirs: they huit and lew together, conFult eath wther concerning their drefs, and affociace at rheir idle hours. Young men, in the frme manner,
prefer the fociety of their equals of the fime fex till $\mathrm{F}_{\mathrm{r}}{ }^{*}$, then fuch time as their hearts begin to feel the impulfe of a new paftion. 'This foft pathon, indeed, caules the youth tu preter the company of his favournte maid to that of his dearelt companion; and it perhaps caules the virgin to view her female companions with a jealous eye, while the fers that their charm, may win the heart of the youth whofe fond regard the lierfelf wilhes to engage. But the fear, the jealoufies, the timidity, nay even the fondnefs of love, are incompatible with friendllip. Though the lover and his millects be dear to each other, yet the frec conndence of friendihip cannot take place between them. They dare not yet venture to truft to each other all the fecrets of their hearts. But if their mutual wilhe be crowned by marriage; then, indeed, as their in:terfts become the fame, it the tranfports of love ate not facceeded by the calm delights and the free confidence of friendinip, they mull be unhappy. The marriage ftate is peculiarly favourable to friendahip. Perfons whole relations to each other are more remote, will often find circumilances concurring to induce them to cultivate a friendly intercourfe with each other. But here indifference is almolt impollible. It is abfolutely requilite, in order that they may not render each other miferable, that the huband and the wife be united in the bonds of friendlhip. This feems even to be one of the great laws of nature, by neans of which provifion is made for the happinefs and the prefervation of fociety. But though the wife and the hulband be particularly attached to each other by the ties of friendthip no lefs than by thofe of love, yet their mutual affection will not detach them from the rell of the world; their relations to the fociety around them will ftill remain ; the huband will flll cultivate the intimacy of thofe of his onn fex, and the wife wil! thill choofe female in preterence to male friend. Upon even a fuperficial view of lie, we find reafon to declare without hefitation, that acquaintance and intimacy moft naturally take place among perfons of the fame fes. The hufland and the wife are more than friends; they are one bone and one, foff. It hat been fometimes fightly infinuated, and fometimes more openty affert. ed, by people who have but carelefsly viewed the phenomena of focial life, or have been difpoled to cavil againft the fair fex, that women are incapable of fincerity or conflancy in fiiendhip with each other. But it leems unneceflary to offer a lerious refutation of : i) i* cavil. Neither is the gencral character of the fenate fex fo inferior to that of the male, nor are their circumflances fo very diflerent from ours, as to reader them totally incapable of thofe virtues which are neceflary to eftablifh and tupport mutual fiendhap. They are in general polfefied of more esquifite fenfibility, niecr delicacy of tafle, and a juter fenfe of propricty, than we, nor are they deltitute of generofity, fidelity, and firmuch. But lich qualitics are peculiarty favourai ?e to friendthip; they communicate a cortain charm to the manners of the perton who is adomed with them; they render the heart fufceptible of generous difintere ${ }^{3}$ ed attachment; and they clevate the foul above levity, infincerity, and mannels. Conspetitions and jealufies muft no doult arife now and then even among the moft amidtle of the female fer, as $v$ chl as among us. Thele will preclude or deflroy $\mathrm{C}_{5} 2$ friendiar.

## F R I $\left[\begin{array}{lll}2,6\end{array}\right] \quad \mathrm{F}$ R i

It man friewhip. But the rivalry of heauty, of drefs, of fahion, is not oftener fatal to friendiaip among the foir iex, thau the contelts of pride, avarice, vanity, and ambition, among thicir haughty lords. If friendthip, be ranked among the virtues, it is not lefs a female thin a male virtue.

The delightful intercourfe and intimacy of friendflip may be naturally expected to fubfift not only between the luuband and the wife, but among all who are connected by any of the relations of confanguinity. The power of inftinct does not always continue to unite the parent and the child. Is offices are of a temporary nature; but when thefe are performed, it ceales to operate. Durine the infancy, the childhood, and even the youth, of her fon or daughter, the parent watches over them with fond affection, and labours with ansions atfiduity to promote their welfare, for no other reafon but becaufe the yearnings of paternal affection draw him towards them. But as they advance farther in life, and become able to care for themfelves, it has been fo ordered by the wifdom of nature, that the attachment of the parent almoft dies away, unlefs the grateful affection and the merit of his children afford him reaton to rejoice over them and blefs them. How thocking, how milerable, the condition of that family, whefe members are not united by the mutual efteem and confidence of friendihip! where the parent views his children with jealoufy, thame, indignation, or forrow : and the children anxioully avoid the fociety of their parents! Their interetts are fo nearly connected ; they have fo many cccafions for acting in concert, and mult live fo leng together ; that we may almott venrure to aftirm, that the parent and the child, like the hufband and the wife, mut be cither friends or enemies. But the ties of nature, the influence of habit, fentinents, and circumftances, all concur to form between them the facred comnexion of friendlhip. Brothers and fifters, the children of the fame parents, and for a while members of the fame family, may be expected to regard each other through life with kindnefs and efteem; and thefe we would rather choofe to attribute to a rational attachment, founded on certain principles, than to a blind inftinctive affection.

Thefe are a few of the diftinctions and relations in fociety which appear moff favourable to friendihip.Were we to defcend to minuter particulars, we might enumerate all the varieties of tafte, of temper, and of circumptances, by which mankind are diftinguilhed from one another, and diftributed into particular claffes. But this would be too tedious, and does not appear neceffary.

As friendohip is an attachment which takes place between certain human characters when placed in certain circuraftances, there muft therefore be laws for fupporting the attachment and regulating the intercourfe of friendfhip. Mutual efteem is the bafis on which true friendihip is eftablihed; and the intercourfe of friendihip ought furely to be connected in fuch a manner that this foundation be not injured. Friendthip muft diminith neither our henevolence nor prudence : it mult not fedace us from an honell attention to our private intereft, nor contract our focial sffections.

Sincerity may be confidered as the firf law of friendकhip. Artifice and hypocrify arc imimical to all focial
intercourfe. Between the deceitful and the honef, fiemplaip. frienditip can never fubfitt. For a while, the one may impore on the other; uniuipicions integrity may not be able to fee through the maik under which the bideous features of felfifh cumning are veiled; but the deceit'ul friend muft ever be a franger to the delightful fentiments of genuine friendimip. To enjoy thele, your virtues mult be fincere, your affiction for the peifon whom you call your friend unfeigned; in communicating to each other your fentiments, in offering and liftening to mutual advice, in joining to profecute the fame defigns. or thare in the fame amulements, candid fincerity muft Itill be obierved between you. Attempt not to perfuade each other, that your nutual affection is more ardent, or your mutual efteem more profound, than it really is. If the fentiments or opinions which the one exprefles appear to the other improper or ithfounded, let not a falle delicacy prevent him from declaring his realons againit them; let him not applaud where, if he were fincere, he mutt blame. Jom not even your friend in an undertaking which you lectetly dilike, or an amufement infufferably difagreeable to you. You cannot, confiftently with finceraty and candour : and you will foon begin to think the blefings of friendhip too dear, when bought at the price of furh facrifices.

But though fincerity is to be faithfully obferved in the intercourle of friendhip; yet the harhinefs of contradiction mult be carefully avoided. Thofe obliging manners which are fo agreeable in an acquaintance or cafual companion, are itill more fo in a friend. If they are neceflary to recommend the advantages of focial intercourfe in general to the members of fociety, they are no lefs neceflary to communicate a charm to the intercourfe of friendihip. People often think themfelves entitled to behave to thofe whom they call their friends, and whofe interefls they profefs to regard as their own, with harfhnefs, negligence, and indifcreet familiarity; but nothing can be more fatal to friendihip. It is a well known maxim, eftablithed by general and uniform experience, that too much fomiliarity occafions mutual contcmpt. And indeed how can it be otherwife? Mild obliging manners are underftood as the natural and genuine expreffions of kindnefs and affection: boifterous rudenefs, petulance, and neglect, are naturally confidered as expreffive of oppofite fentiments. But if friendilip affume the tone, the carriage and the language of enmity or indifference, it mult foon lofe all its native charms and advantages. Let the friend, as well as the cafual companion, when he finds reafon to difapprose of the fentiments and conduct, or to diffent from the opinions of his friend, exprefs himfelf in the gentleft terms, with honefty and fincerity, but without carelefsnefs or harthnefs. Let no frequency of intercourfe nor union of interelts ever tempt to carelefs or contemptuous familiarity. Stifi and unmeaning ceremony may be banilhed; but eafc, and delicacy, and refpectful deference, and obliging attention, muft fupply its room. Nuch of the unhappinefs of the marriage itate, and much of the mutual uneafinefs which ariles among thofe who are related by the endearing ties of confanguinity, is occafioned by the parties who are thus clofely connected, thinhing it unneceffary to obferve the ordinary rules of good breeding in their mutual intercousf. Even hindnefs

Frienda'p futs on a daguting gerh, and aftames ! Thuth ali et. But mataal bindnets cannot there hang disitt. Il me, which ought to be a handuary to theites from the ansicties a diols of life, a litice patalic where thofe pare and imocent $1^{\text {leatures misht be orgosed which }}$ afford the most genume happinct, ant hich ate not to be tathed in the Lutle of the buly and the dillip.ttion of the gay norld; home thus becomes a phace of orment, which is never entered but with pin and tumillingnef; and from which the fon, the daughter, the huhand, and the wife, eagerly deize every opportunity to eicape.

Wutual confidence is the very foul of friendihip. If friendinip be rightily defined to be a mutual alluction founded on mutual etteem, thofe who are united in the bonds of friendihip cannot but repole mutual confidence in each other. Am I confeious of none lat generous worthy fentiments, and none but upripht honell intentions? I reacily difclofe all the fecrets of my foul to him whom I regard as capable only of fimilar defigns and fimilar fentiments. But it may be atked, how far the confidence of friendihip ourht to be carsied? Nut I reveal to my friend all my fentiments, opinions, and defigns? Muft I communicate to one friend the fecrets which have been intruled to me by another ? Or mull I rather oblerve the mof fufpicious caution in my intercourfe with my friends, remembering that he who is now my friend may one day become my enemy ? It feems moll prudent to obferve a medum between fufpicious caution and unlimited confdence. Were human virtue perfe 7 , and were there no intances of friends ever becoming enemies, thofe who regard each otber with friendly afiection might very realonably be required to fet no bounds to their mutual confidence. But as this is far from being the cafe, different meafures are to be oblerved. Contract no friendhips, if you think it neceffory to treat a friend with the fame referve as an enemy. Set venture not to difclofe to your friend all the foolifh or evil defigns which the wartonnefs of imagination may feduce you to form. When you feel the cmotions of pride, of vanity, or of any evil paflion, if yon are able to reprefs them by the itrength of reaton and confcience, it feems unneceflary for you to tell the itruggle, or to boaft of the victory. If, at any former period of life, you have been fo unfortunate as to commit actions which you cannot now recollect without fhame and contrition, there can be no reafon why you may not, as far as poffible, bury the remembrance of them in your own brealt. In thort, not to become tedious by defcending to minute particulars, the laws of friendthip do not require friends to unbofom themfelves to each other any farther than is neceflary-to give them juft ideas of each other's character and temper,-to enable them to be ferviceable to each other in the profecution of honeft defigns,-and to afford each of them proper opportunities of exeiting the other to virtue and wifdom, aad of interpofing his influence to preferve him from vice and folly. Whatever is neceffary for any of thefe purpofes ought to be mutually communicated; whatever is not, may be conccaled without violating the laws of friendfhip. As mutu.al efteem is the foundation of friendihip, and as human friendhips are not aluays lathing, you wught not to pour into the ear of your friend all the impertinences

 to diverve the hame fuqtaric.. cout: of he wive your chemy. The ancienic, sion thliad of friaddaip with enthuhafm ar ore of ilf inut ele al : an e sirtues, serpureal dill a clofer mana and i. mata ibinterefled attachment :mony tiends thar we dive venthate to infilt mon. The mutha dation which they
 winat extratagant. Ameng other thins - , brome of them have gone fo id: as to requicio a digrie ef nutat confidence which would foon devroy :ill conifence, and could not faii to counteract all the puppofe of iriendfhip: they have required one friend to comnunicate to another, not only all his own theughte atd purpoles, but even thofe fecrets which have biea conided to his honour by any other friend. But the evil confequences which would refu't ase eatily to he forefeen. Perhaps, like A:ticac, you enjuy the friendlhip of men who are mutud enemies; and by communicating the fecrets of the one to the other, you will then tecome the betrayer of both. Or, thongh not alsanatily enemies, yet thofe who are your friends may lappen not to be in habits of friendhe with esth other; and they may then perhaps not fcruple to divulge thole iecrets of one another which you have imprulently blabhed to them. Indeed, might we furpole all manhind abfolutely faultlefs, and not liable to moral imporicection, we need not fear thefe bad coniequences from whounded confidence in our rimends. But friondifip would in fuch a itate of fociety be unhoove jut as in the golden age of the puets there are fuppofed to have been no diltinctions of properts. We cannot here forbear dropping an obfervation, which will readily be acknowledged as jut by all who have any tolerable knowledge of the moraity of the phitofophers of ancient Greece. All their doctrinc, and precepts appear calculated for a diferent order of beings than mankimb. They glanced careleisly at the phenomena of the moral world; and gleaning a few facis, immeniately fet themfelves to ered fyftems: Fiom thefe, however wild and theoretical, they then pretended to deduce laws for the regulation of human conduct; and their rules are generally fuch as might be expected from the means which they appear to have employed in order to arrive at them. An apology has however been offerel for fome of them, which, in our opinion, could occur only to fuperficial obfervers of human life. It has been alleged in behalf of the Stoics, that their fyltem indeed required more exalted sirtue than human nature is capable of attaining ; but that, notwithranding this, it could not tail to produce the happiel? effects on the manners and fintimetits of its votaries. Iathances, too, have been produced in fupport of this affertion; a Cato. an Epictetus, an Antotimus. When we contemplate a model of perfection beyond what we can hope to reach, fay the advocates of the Stoic philofophy, though we defpair of attamin', yet we are prompted to afpire after it. Now, the molt natural way of reafoning here feems to lead to a very different conclufion. If an ohjeet is fet before me which I mult not hope to obtain, I am unvilling to wathe my time and

## $\left.\begin{array}{llllll}\mathrm{F} & \mathrm{I} & {[238}\end{array}\right] \quad \mathrm{F}$ R 1

Fra hit. ahatat ay vizour in the purfuit of it: bid me afcend an inacctitible height, I view the vale below with new fondnes. Philofophy, as well as fupertition and enthanafm, might in a few inftances triumph over the frinciples of nature ; but was it alway: equally powerful - Were all the dilciples of Zono Catos or Epictetufes : Have all the monks and anchorites of the Romish church been holy as the founders of their orders? No: The Greek philofophers who infetted Rome, and taught thofe whimjical doctrines which we hear frequently dignified with the name fublime, were fingulaly cosrupted and licentious in all their manners. If thefe of the regular clergy of the church of Rome have been alwavs more pure, they have been cruelly colummiated. Aik, then, only what I am capable of performing: if you demand what is above my ftrength, I fit alll in indolence. In its general tendency, the Stoic pliiiofophy was favourable rather to vice than to virtue.

But we have not yet exhamfed all the duties of friendihip. We have inculcated fincerity, and mutal refpect and obligingnefs of manners; we have alfo endeavoured to afcertain what degree of mutual confidence ought to take place between friends. But an important gueftion ilill remains to be confidered: how far is an union of interefts to take place between friends? Am I to fludy the intereft of my friend in preference to my own? Nay I lawfully injure others, in order to ferve him? Here, too, we muft confider the circumflances and the ftrength of human nature; and let us beware of impofing burdens too heavy to be borne. The greater and more perfect the union which reigns in fociety, the greater will be its Hrength and happinefs; the clofer the union of friends, the more advantages will each of them derive from their union. Where other ties befides thofe of friendihip concur to unite two individuals, their interefts will be more clofely conjoined than if they were connected by the ties of friendfhip alone. The order of nature feems here to be,-the hulband and wife-the parent and childbrothers and filters, the offspring of the fame parentsfriends, connected by the ties of friendihip alone. And, if we may prefume to guefs at the intentions of the Author of nature from what we behold in his works and read in his word, the clofeft union in fociety ought to be that between the hubband and the wife; their interefts are altogether the fame; they ought mutually to forego convenience and gratification for each other's fake. The interefts of parents and children are fomewhat lefs clofely connected; much is due from the one to the other, but fomewhat lefs than in the former relation; their interefts may fometimes be feparate, but never ought to be oppolite. Next come brethren, and other more difant relations; and next, the friend. In thefe cales, where we fuppofe the attachment of friendihip to operate together with the ties of nature, we perceive that interefls are varioully united, and various duties are due; fcarce in any of them does it appear that the interefts of two can become entirely one. Still lefs can that be expected to happen, where the ties of friendihip act not in concert with thofe of nature. We give up, therefore, all thofe romantic notions, which fome have fo carnelity infilted on, of requiring the friend to confider his friend as himfelf. We camot capect any two individuals to poffefs pre-
cifely the lame deplee of knowledge, to entertain ex-Friendfin. actly the fame ientiments, or to ftand in circumftances precifly timilar. But till this happen, the interefts of two can never be precifely the fame. And we will not, therefore, require the friend actually to prefer his friend to himtelf; nay, we will even allow him to prefer himfelf to his friend; convinced that fuch is the defign of nature, and that by prefuming to counteract the principles of nature we thall be able to ferve no ufe.ul purpole. But as far as the firit principles of human action and the intlitutions of fociety permit, we may reatonably require of friends, that they mutually endeavour to contribute each to the other's intereft. You will not delert your own family, nor neglect what is abfolutely nectlary for your own prefervation, in order that you may ferve a friend. It is not requifite that you be either a Damon or a Pythias. Away with what is romantic ; but fcruple not to fubmit to what is natural and reafonable. When your friend needs your direction and advice, freely and honeftly give it : does he need more than advice; your active exertions in his behalf? the laws of friendihip require you not to refufe them. Is it neceflary for him to receive ftill more fubitantial affiftance? You may even be expected to aid him with your fortune. But remember, that even the amiable principle of benevolence nauf be fubject to the directions of prudence: if incapable of taking care of ourfelves, we cannot be expected to contribute to the good of others: fociety would not be favourable to the happinefs of the human race, if every individual ftudied the general intereft fo far as to neglect his own. We are not born to be citizens of the world; but Europeans, Britons, Englifhmen or Scotchmen. Let every one, then, feek the interelt and happinefs of his friends with whom he is connected by the laws of friendithip alone, in fubordination to his own particular interelt and happinefs, and to the interelt and happinefs of thofe with whom he is connected by the ties of nature and the general inflitutions of fociety. Engage not in the fervice of your friend, nor lavith your fortune in his behalf, if by that means you are likely to injure either yourfelf or your family. Still lefs will you think it requifite to carry your friendlaip to fuch romantic eacefs as to commit crimes in the fervice of your friend. The ancients, whofe ideas of the nature and duties of friendihip were romantic and extravagant, have, fome of them, required that a freend thould hefitate at no action, however atrociouly wicked, by which he can be ufeful to his friend. Have I been guilty of theft or murder, or any other heinous violation of the laws of morality or the inftitutions of fociety: when I am brought to juitice for my crime, it you, being my friend, are appointed to fit as my judge, the laws of friendlhip, fay thofe admirable matters of morality, require that you pronounce me innocent, though convinced of my guilt. Bat we need not declaim againtt the abfurdity of enjoining fuch bafe deeds as duties of friendhip. The idea of a connection, the laws of which are inimical to the order of fociety, mult ftrike with horror every perfon who thinks of it. Such a connection is the union of a knot of villains, confpiring againt the peace, nay even the exiftence of fociety.

Such we apprehend to be the of the friendhip; fuch the circumftances in the order of na- witind-
$\underbrace{\text { Friendiaip tue and of fociety which are mont favourable to this }}$ union; and fach the duties, by the performance of which it may be maintained. When founded on thefe principle, and regulated by thefe laws, friendThip is truly sirtuous, and camot but be highly beneficial to the individants between whom it fubfits, and to the interell of fociety in general. How delightful to : we fome perfon of an amiable and virtuous character ia whom you can confide; who will join with you in the profecution of virtwous defigns, or will be ready to call you back when you heedlefly flray into the paths of vice and folly! who will adminiter to you honeit, upright advice; will rejoice in your profperity, will glory over yotir virtues, and will be ready to contole and rclieve you when finking under the prefluse of diftref! ! Muft not your connevion with fuch a perfon be favourable to your virtue, your interelt, and your happinefs? When we furcey any fublime or beauteous fecne in nature, we wihh for fome perfon of congenial tafle and feelings to participate with us in the noble enjoyment which the profpect affords; when we read any fine piece of compofition, the pleafure which we receive from it is more exquifite if others join with us in applauding it. The landicape which we have often furveyed, the poem which we have often read, pleafe us anew, with all the charms of novelty, when we have an opportunity of pointing out their beauties to fome perfon to whom they have beea hitherto unknown. Friendihip communicates new charms and a more delicate relih to all our moft refined and elegant pleafures. It enlivens our joys, it foothes and alleviates our forrows. What Cicero has faid of polite letters and philofophy, may be with fill fironger propriety faid of friendhip. In every condition of life the intlieace of virtuous friendhip is favourable to our welfare and our happinefs: in profperity, in adverfity; in the hilence and tranquillity of retirement, as well as anvid the hurry of bufinefs; in the bofom of your family, and when furrounded by your nearell connections, no lefs than when removed to a flrange country. Indeed, whatever advantages focitty teifows above what are to be enjoyed in a favage flate, not lefs mumerous nor lefs important are thofe which we may derive from uniting in the bonds of friendhip, rather tion living in a flate of enmity or indifiternce.

But though friendhip, when fombed on mutual M:fakes in efteem, and regulated by the lass of prufence, benevo-
forming friendthirs, and conitquent inconftancy. lence, and honefty, be productive of io many happy effects; yet many inftance. occur in the worh, in whirh connexions dignised with the rame of friendhip are unfavourable both to the virtue and the happinets of thofe betwen whom they fubll. When men aflociate from views of converience; when their union is haftily formed without a hmosledge of each other's temper and character; when they are drawn tozether by accident, as when they happen to agree in the purfuits of the fane interefts or platures; when the young and the gay refort together to the haunts of dilipation, and the covetous and ambitious find it convenient to toil in concert for riches and power: on all fuch occafions, the comaexion which is formed and dignified with the name of friendhip is unworthy of that honourable appellation. It is not virturus; it is productive of no hapry efleets, and is equickly difilved. He, therffore, who is rict incapa-
ble of virtuous friendihip, and is defions of ctijosing its Fruesden. advantages, mult carefully confider the nattire of the connexion which he wilhes to form, gain a thorough ac quantance with the character of the perfon whote efteem and affection he withes to acquire, and rotend to thofe rule by the obfervance of which true triendinip may be maintained.

Many inlances are related, which thow what power Relation il it is poflible for friendihip to acquire over the human aftrating heart. We need not here repeat the well-known llory the power of Damon and Pythias, whofe generous friendihip at- thip over forded a pectacle which loftened even the Favage heart the buman of Dionylius. It is known to every Chool-boy; and, heart. after the affecting narrative of Valerius Maximus, las been itudioutly detailed and commented on by almoft cvery fucceeding fory-teller or moralith. Addifon, in one of his Spectators, gives a beautiful little relation, we know not upon what authority, which finely illuttrates the power of both friendlhip and love. Two male negroes, in one of our Welt lndian ihands, nearly of the fame age, and eminent among their fellows in ilavery for gracefulnef of figure, ftrength, agility, and desterity, were allo ditinguithed for their mutual friendthip and for their common attachment to a young female negro, who was generally efteemed the mot beautiful of her complexion in the whole inland. The young female appeared to be equally pleafed with both her lovers; and was willing to accept either of them for a hubband, provided they could agree between themfelves which of them hould yield to the pretentions of the other. But here lay the difficulty; for while neither would treacheroully fupplant, neither of them was willing to yield to his friend. The two youth, therefore, long fuffered the feverelt atlliction, while their hearts were torn between love and friendihip. At length, when they were no longer able to endure the agony of fuch a contedt, being $\mathrm{li}^{\prime} \mathrm{l}$ unable to reprefs their pafion for their lovely comrywoman, and incapable of violating the laws of friendrhip,-on a certain day, they both, in company with the ofject of their illfat d love, retired into a wood adjoining to the licene of their labours. There, after fondly cmbracing the maid, calling her by a thoufand endearing name, and Jamenting their own inhappy fate, they tlabbed a knife into her brealt ; which, while tlill recking with her blood, was by each of them in hiv turn plenged into his own. Her crica reacled the people who were at work in the next lieid: fome of them hatening to the foot, found her expiring, and the two youths already dead behide her.

We have introduce it this little narrative as a itrining intlance of the noble effecs which maturnlly refult from genuine fiendtip. Itere we fee it fuperior to the force of the molt violent of palifons. Hal the elevatod louls of thete negro youth been refined and enlightened by culture :and elucation in the principles of morality and true relfigion, we may reafonably fuppote that therr fricadihi) would hase triumphed over their Hew, without prompting liem to the rah and defperate deed which they committed.

Friendrlip, thus amialbe in its character, thas be-not an no nebctal ia its inflaence and effect, the theme of un-lift. $t$ with bouvded panegyric to the philofopher, and moralits of (thernete evely age, has been fad by fonwe refpectable modernty. witers to be inconfilent wish the pirit of that holy ${ }^{\text {ty }}$

## F R I $[2 \neq 0 \quad$ F R I

Trith edigisn whin we profef, and whith we regent an the revelation of heaven. General benevolence is frequently incuicated through the golpel: "Jefus often camently intreated his difiplu, " to love one another ;" and diected them in what manner to difplay their mutual love, by telling them, that "whatfoever things they could reafonably wih to rective from others, the fame ought they to do to them." The writers of the epittles often enlarge on the topics of charity and brotherly love. But private frtendhip is nowhere recommended in the code of Chrintianity. Nay, it is fo incondiftent with that univerfal benevolena which the gofpel enjoins, that where the one is recommended and enforced, the other may be undertiood to be tacitly forbidden. But can that religion be true, or can it be favontable to the happinefs of its votaries, which is inimical, nay, which is even not friendly to virtnots friendhip? Such are the fuggeftions of Lord Shaftefbury and Soame Jenyns on this head.

We muft grant them, that the fyftem of morals or religion which difcourages a connexion fo noble in its origin, to amiable in its character, and fo beneficial in its intiuence, as virtuous friendhip, is rather untisourable to the happinefs and virtue of its vota. rics. But we mult confider the genius of Chritianity with more careful attention, betore we fuffer ourfelves to be periuaded that friendilip is inconfirlent with it. Univerfal benevolence is, indeed, inculcated in the gofpel: we are required to love our neighbours as ourfelves: and our Saviour feems to infinuate, in the itory of the humane Samaritan, that we ought to regard as neighbours all our brethren of the human race, however feparated from us by any of the diftinctions of fociety. But it would be unfair to conclude from this, that the great Author of the gofnel meant to abolifh the order of focial life, or to oppofe the ties of nature. Thefe may ftill be refpected, though the laws of this benevolence be obeyed. The parent is not required to defert his child, in order that he may affift or relieve his neighbour; nor the child to leave his parent to perith under the inffirmities of old age, while he hattens to lend affutance to a flranger. The gofpel was not intended to difiolve communities, or to abrogate the diftinctions of rank. In Jefue, the end of the ceremonial law was accomplithed: by him, therefore, that burden of types and cermonies with which the Jews had been loaded wastaken away. But he who abolihed the cercmonial law declared, that the obligations of the moral law fhould be more permanent than heaven or earth: The duates which it enjoined were fill to be religioutly difcharged : The procepts of the gofpel were to illuftrate and enforce, not to cuntradict, the intitutions of the moral law. The reative duties of parents and children were thill to be fertormed; thumh men were dirested not to confne all their ientiments of henevoience to dometlic telations. Jefes, in hir conduct, did not Fe: hindif to oprote the order ot tacity. in various parts of the New Tektament ant the focial dutie: are defed and detorced: the mutual duties of parenth and calitren, of hulands .nd wives, and of mafters and fenante. The fubniffon of all itw wembers fa communty to that power which is velle $\rfloor$ with antlority of the whole, is aho itrietly cnfoned in the gofpel. Jefus, when in lis laf moments he recommended his wother to the procsition of his beloved diciple, chole
to alk hins to conder ler as a parent; and directed Fnendmi, her to expect from him the refpect and bindnefs of a fon. Thefe facts and obfervations teach us in what fenfe to underiland that univerfal benevolence which is inculcated in the grofrel. Though we are to love all mankind, yet it is not neceflary that a!] the individuals of the human race fhare our affection alike. Were we powerful, and wife, and benevolent, as the Deity, fuch extentive benevolence might be required of us: But our fuhere of action and oblervation is narrow; we cannot extend our acquaintance or intluence beyond a very limited circle. Were we to endeavour to be equally ufeful to all mankind, we fhould become incapable of being ufeful to any individual. We cannot become citizens of the world in the fenfe in which fome philofophers have affected to call themfelves fuch, without becoming outcaits from every particular fociety. A fon, a brother, a countryman, a franger, lie around you, each in circumftances of extreme diftrefs; you pity their misfortunes, and would gladly adminifter relief; but fuch is your benevolence, that you feel precifely the fame degree of compaffion for each of them; you cannot determine to whom you fhou'd firft ftretch out an helping hand; and you therefore ftand like that venerable afs of the fchoolmen, whofe tantalizing fituation between two bundles of hay has been fo long celebrated and lamented by metaphyficians ; and fuffer fon, and brother, and countryman, and ftranger, to perith, without relieving any of them by your kind offices. It is therefore the defign of the gorpel, that we hould fubmit to the laws of nature, and comply with the inftitutions of fociety. Firf, attend to felf-prefervation; next, perform the dutics of a wife or huband,-a parent,-a child,-a brother,-a citizen-, an inditidual of the human race. You will do well, indeed, to regard all mankind with benevolence; but your benevolence will be unavailing to the objects of it, if you overlook the ditinctions of nature and thoic inflitutions which fupport the union of fucia! life.

Put if the firit of Chritianity be not inimical to the inftitutions and relations of fociets, neither can it be unfavourable to friendihip. If that benevolence which the gofpel enjoins adnit of any modifications, why not of that particular motification which conflitutes private friendhip? It is not, iadeed, directly enjoined; but neither is it forbidden. It is perfectly confitent with the general tendency and firit of the goipel fyitem : being favourable to the intcrefts of fociety, it cannot but be agreeable to our holy religion.

But it is recommended by no direst precept, fay thofe who would reprefent Chrifianity as inimical to it; while it has been the favourite theme of the philufophers and moralifls of the heathen world.

But why thould friendihip be recommerded by means different from thofe which the gefpel employs for the purpofe? Make yourfelf well acquainted with that admirable fytem which you fo earneitly oppofe; you will find that even the ontics of private friendthip are better explained and mure powerfully enforced in the gefpel, than by all the heathen phitefophers and pects foni Hefiod to Plutarch. The gofnel nakes a ditinction between the virtuous and the vicious; it rcprefents one character as more aniable and refpectable than anotbcr. As it dittinguibes between virtue and

## $F$ R I $\left[\begin{array}{ll}2+1 & \text { F R I }\end{array}\right.$

Friendin'p. vice, beiwcen piety and impicty; fo its great object is to deter us from vice, and to encourage us to the practice of virtue. It cannot be fuppofed, then, that the goferl will direct us to aflociate indifferently with virttous and prorligate characters. It does not. It directs us to feek improvement, by affociating with thule whom tre have reafon to eiteem. It directs thofe who ase incorrigibly wicked to be expelled from fociety. What is this but to command us to enter into habits of imimacy wherever there is ground for mutual efteem? But this is the only batis of genuine friendthip. When all the means which lead to a certain end are laid before you, and when you are particularly directed by fome high authority to employ thofe means: though the end which you thus attain be not pointed out, yet the commanding you to employ fuch a leries of means, is cvidently the lame as if you were directed to accomplifh the purpofe to which they tend. Thus, though the precepts of Chritianity do not directiv enjoin private frienditip; yet they have a direct tendency to form thofe exalted characters who alone are capable of true friendihip; they inculcate thofe virtues which naturally give rife to this generous attachment, and are ablolutely necentary to fupport it where it is formed; they inculcate benevolence by the molt effectual motives, and admit of modifications of that benerolence, correipondent to the relations and inflitutions of lociety: And therefore they may be confidered in as ftrong and direct terms as if it had been exprefsly faid, " Cultivate private friendihip." Befides, friendihip is rather an accident of fociety, a natural confequence of our character as moral and focial beinge, than a relation to be regulated and defined

Frie: © This union, fo natural between virtuous perfons, c:u telar- has been countenanced by the example of the Author ced by cur Saviout"s evampie.

* W. M
moth, E. in the col ciuding note +n lis Trathation of Cisere's Le:"ut.
was adruncing t, the we, at on with the are F lations of the decealcd, be dreunard the tiune emmotions of grict as fuelled the them cith with whom La-
 thizing with their common lo, fum, te meded ineo tears. This circumat ance way tos remothable is oh peperticu lar oblemation: and it diew from tha Hiceliciut, what one dhoud think it math necellaily di: if an ane
 how he loved him!?
" But in the concluding cataltrophe of our Saviou: life, he gave a atill more decinve proof that fentimulis of the itrongelt perlonal attachment and friendinip were not unworthy of being admitted into his facred bofom: they were too decply, indeed, impretied, to be extinguithed even by the moll excruciating torments In thote dreadful moments, oblerving among the atflicted witnefles of his painful and ignominious fufferings, that faithtul follower who is deferibed by the hiftorian as 'the difciple whom he loved;' he diAtinguiked him by the mott convincing inflance of fuperior confidence, efteem, and aficetion, that cver was exhibited to the admiration of marhind. Fur, utder ciscumitances of the moft asouizing torments, whe's it might be thought impofible for human niture to retain any other fenfibility but that of its own inesprelfible fufferings, be recommended to the care and protection of this his tried and approved friend, in terms of peculiar regard and endearment, the moit tender and facred object of his private affections. But no latiguage can reprefent this pathetic and affecting icere with a force and energy equal to the fublime fimplicity of the Evangelit's own narrative: 'Now there itoo 1 by the crofs of Jefus, his mother and his mother's fiter, and Mary Magdalene. When Jefus haw his mother and the difciple (Itanding) by, whom he luved; he faith to his mother, Behold thy fon! then he daitin to the dilciple, Behold thy mother! And from tiat hour that difciple took her to his own home.'
" It may fafely be afferted, that among all thefe memorable examples of friendihip, which have been celebrated with the higheft encomiums by the anciunt, there cannot be produced a fingle inftance in waicia the moft ditinguihed features of exaled amity are fo ftrongly difplayed as in the foregoing rifution. The only one, perhaps, that bears even a faint fimilitude to it, is that famous tranfaction recorded by a Grcek author, which palled between Eudamías and Aretheus. But when the very difterent circumatate. attending the refpective examples are duly confidered, it mult be acknowledged, that the former rifes as much above the latter in the proof it exhidit of tublime friendilip, as it does in the dignity of the chandetes concerned.
" Upon the whole, then, it appos, that the divire Founder of the Chriltion relision, an well by his own example as by the fipit of his motal doctrme, has mot only encouraged hat condecrated ti.anthip."

FRIESLAND, one of the united provitaces of the Lon Countrices. It in bounded on the eant by the river Lauver, which parts it from the londhip of Gioninmen, on the fouth by Oreigfiel, on the wall by the \%wice \%ee, and on the north by the C. mam escan. It is as mike from north to fouth, and 2 人 $1: m$ catt to weth. '1l.c lard is wery fottile in coran and. : 11 h

Frifiland Iture; the herfes are large, and the cows and fhecp
A 1 prolific. It is divided into three parts; Welfergo to Frisht.
the wel? Ontergo to the eaf, and Sevenwalden io the
fouth. The illands of Sheling, Ameland, and other finall ones, are dependent on this province. The principal towns are Leuwarden the capital, Franeker, Dockum, Harlingen, and Staveren.

Triesland, Eaft, a prowince of Germany, in the circle of TVeitphalia, lying near the German ocean. It is bounded on the fouth by the bifhopric of Munfter, on the eall by the county of Oldenburgh, on the weft by the province of Groningen, and on the north by the fea, being about 50 miles in length, and 30 in breadth. It belongs to Pruffia, and was formerly called the county of Embden. It is a very fertile country, and feeds a great number of cattle ; but it was greatly damaged by an inundation in 1717 , and the repair of the dykes coft an immenfe fum. The principal towns are Norden, Leer, Eflens, Whitmunde, and Aurick. Embden was an imperial city, and the principal place in the country; but now belongs alfo to the king of Pruffia, who bought it of the Dutch.

FRIGATE, in naval affairs, a fhip of war, ufually of two decks, light built, defigned for fwift failing. When it hath but one deck, and confequently is of a fmaller ize, they call her a light frigate.

Frigates mount from 20 to 44 guns, and are efteemcd excellent cruifers. The name was formerly known only in the Mediterranean, and applied to a long kind n? vefiel navigated in that fea with fails and oars. The Englim were the firlt who appeared on the ocean with thefe llips, and cquipped them for war as well as for commerce.

Fr/g.iqe-Buit, denotes the difpofition of the decks of fich merchant fhips as have a defcent of four or five Iteps from the guarter-deck and forecalle into the wiilt, in contradifinction to thofe whofe decks are on a continued line for the whole length of the fhip, which are called salloy-built.

FRIGATOON, a Venetian veffel, commonly ufed in the Adriatic, built with a fquare hlern, and without any fozmatt, having only a mainmaft, mizenmaft, and howfprit.

FRIGIIT, or Terror, a fudden and violent degree of fear. See Fear.

Sucten fear is frequently productive of very remarkable cffects upon the human fyttem. Of this many inllances occur in modical writings.- In general, the efiects of terror are a contraction of the fmall veffels and a repultion of the blood in the large and intwrnal ones; hence proceed a fuppreflion of perfipiration, a general oppreflion, trembling, and anguifh of the heart, and lungs overcharged with blood.
l'ignt often occation incurable difeafes, as epilep. fiv, ilupor, madnefs, \&ic. In acute difeafes, they have vidently killed many, by the agitation into which they have triown the firits, already too much difordicid. We tave alfo accounts of perfons abfolutely l.ilted $d$ terrors when in perfect health at the time of resesing the hook from them: people ordered to be exciuted, hut with private orders for a reprieve, have expired the olock without a wound.-Out of many ir annees of the fatal effects of fear recorded in writers, the follo ing is felected as one of the moll fingular. "George Grochantzy, a Polander, who had indifted as
a foldier in the fervice of the king of Prulia, deferted Fright. during the war. A finall party was fent in purfuit of him; and when he leat expected it, they furprifed him finging and dancing among a company of peafants, who were got together in an inn and were making merry. This event, fo fudden and unforefeen, and at the fame time fo dreadful in its confequences, fruck him in fuch a manner, that, giving a great cry, he bccame at once altogether itupid and infenfible, and was feized without the leaft refiftance. They carried him away to Glocau, where he was brought before the council of war, and received fentence as a deterter. He fufiered himfelf to be led and difpofed of at the will of thofe about him, without uttering a word, or giving the leall figu that he knew what had happened or would happen to him. He remained immoveable as a ftatue wherever he was placed, and was wholly pallive with refpect to all that was done to him or about him. During all the time that he was in cultody, he neither ate, nor drank, nor flept, nor had any evacuation. Some of his comrades were fent to fee him ; after that he was sifited by fome officers of his corps, and by fome prielts; but he ftill continued in the fame itate, without difcovering the leatl figns of fenfibility. Promifes, intreaties, and threatenings were equally ineflectual. The phyficians who were confulted upon his cafe, were of opinion, that he was in a flate of hopelefs idiocy. It was at firlt fufpected, that thofe appearances were feigned ; but thefe fufpicions neceflarily gave way, when it was known that he took no fuftenance, and that the involuntary functions of nature were is great meafure fufpended. After fome time they knocked off his fetters, and left him at liberty to go whither he would. He received his liberty with the fame infenfibility that he had fhowed upon other occafions: he remained fixed and immoveable; his eyes turned wildly here and there without taking cognizance of any object, and the mufcles of his face were fallen and fixed like thofe of a dead body. Being left to himfelf, he pafled 20 days in this condition, without cating, drinking, or any evacuation, and died on the 20th day. He had been fometimes heard to fetch deep fighs; and once he rufhed with great violence on a foldier, who had a mug of 1 l quor in his hand, forced the mug from him, and having drank the liquor witl great eagernefs, let the mug drop to the ground."

When a perfon is affected with terror, the principal endeavour fhould be to reftore the circulation to its due order, to promote perfpiration, and to allay the agitation of the patient. For thefe purpofes he may drink a little warm liquor, as camomile tea, \&c. the feet and legs may be put into warm water, the legs rubbed, and the camomile tea repeated every fix or eight minutes; and when the $\mathbb{k}$ in is warm, and there is a tendency to perfpiration, fleep may be promoted by a gentle opiate.

But frights have been known not only to caufe, but * Works, alfo to cure, difeafes. Mr Boyle *mentions agues, gout, $A 6 r$. p. 82, and fciatica, cured by this means.

To turn from the ferious to the ludicrous effects of fear, the following inflance of the latter fort, quoted from a French author by Mr Andrews in his volume of Anecdotes, fhows upon what flight occafions this paftion may be fometimes excited in a very high degree, even in perfons the mont unlikely to enter-

Tieht tain fuch a gacit. "Charles Guftavus (the fucceifor of II Chriftina of Sweden) was befieging Prague, when a boor of moft extraordinary vilage detired admittance to his tent; and being allowed entrance, offered, by way of amufing the king, to devour a whole hog of one hundred weight in his prefence. The old general Konigimare, who flood by the king's fide, and who, foldier as he was, had not got rid of the prejudices of his childhood, hinted to his royal mailer that the peafant ought to be burnt as a forcerer. 'Sir,' faid the fellow, irritated at the remark, 'if your majetty will make but that old gentleman take off his fword and his fpurs, I will eat him immediately before I begin the hog.' General Konigfmare (who had, at the head of a body of Swedes, performed wonders againit the Aultrians, and who was looked upon as one of the bravelt men of the age) could not ftand this propofal, efpecially as it was accompanied by a molt hideous and preternatural expanfion of the frightful peafant's jaws. Without uttering a word, the veteran fuddenis turned round, ran out of the court, and thought not himfelf fate until he lad arrived at his quarters; where he remained above twenty-four hours locked up fecurely, before he had got rid of the panic which had fo feverely affected him."

+ Elements Fear (Dr Beattie + obferves) Mould not rife higher of Moral than to make us attentive and cautious; when it gains able tyranny, and renders life a burden. The object of fear is evil ; and to be exempt from fear, or at leaft not enflaved to it, gives dignity to our nature, and invigorates all our faculties. Yet there are evils which we ought to fear. Thofe that arife from ourfelves, or which it is in our power to prevent, it would be madnefs to defpife, and audacity not to guard againit. External evils, which we cannot prevent, or could not avoid without a breach of duty, it is manly and honourable to bear with fortitude. Infenfibility to danger is not fortitude, no more than the incapacity of feeling pain can be called patience; and to expofe ourfelves unneceffarily to evil is worfe than folly, and very blameable prefumption. It is commonly called fol-hardinefs; that is, fuch a degree of hardinefs or boldnefs as none but fools are capable of. See the article Fortitude.

FRIGID (frigidus), in a gencral tenle, denotes the quality of being cold. It is frequently applied to a jejune ftyle, that is unanimated by any ornaments, and confequently without any force or vigour.

Frigid-zone. See Zonf, Geography Inder.
FRIGIDITY, in Meácine, the fame with ImroTEACE.

FRIGORIFIC, in Pluy/ology, fmall particles of matter, which, according to Gaffendus and others, being atually and effentially cold, and penetrating other bodies, produce in them that quality which is called coll, or, according to others, merely the abfence or diminution of the particles of heat. Sec Coid, CheMISTRY Inder.

FRILAZIN, the name of a clafs or rank of people mong the Anglo-Saxons, confifting of thofe who had been llaves, but had either purchafed, or by fome other means obtained, their liberty. Though thefe were in "atily free men, they were not comidered as of the

## $2+3] \quad \mathrm{F} \quad \mathrm{R} I$

fame rank and dignity with thofe who had been bo: free, but were thill in a more ignoble and dependent conditiun, either on their fummer malles or on fome new patrons. I his cultom the Ang! 1 . 大ivem fien : have derived from their ancellors in Co emony, anong whom thole who had been made fice ciil not differ much in point of dignity or impontane mo the thate from thole who continued in fervitude. I is dillin. tion between thofe who have been made isee and thoow who enjoy freedom by delicent from a long s.ace of frece men, till prevails in many parts of Gemany; and particularly in the original leats of the inglo-Saven Nany of the iuhabitant, of towns and cities i.. "ngiand, in this period, feem to have been of the chafs of men, who were in a kind of naiddle thate between laves and freemen.

FRILL, in Falconry. Whacn a hawk trembles or flivers, they fay the frills.

FRINGILILA, a genus of birds belonging to the order of pafleres. See Ornituonogy Indec.

FRIO, a fmatl illand on the coatt of the Brafls, fituated in $32^{\circ} 3^{\prime} \mathrm{S}$. Lat. and $4^{1^{\circ}} 31^{\prime}+5^{\prime \prime} \mathbb{W}^{\circ}$. Long. The land of Frio is high, with a bollow in the middle, which gives it, at a dittance, the appearance of two leparate illands. The paflage between the itland and the continent is about a mile broad, and feemed to Sir Erafmus Gower to be clear from thoals.

FRIPPER I ${ }^{*}$, a Freach term fometimes ufed in our language to fignify the trade or tralfic of old fecondhand clothes and goods. The word is allo ufed for the place where fuch fort of commerce is carried on, and even for the commodities themfelves. The company of frippiers, or fripperers, at Paris, are a regular corporation, of an ancient ttanding, and make a conlider. able figure in that city.

FRISIl, Frisei, Frisiones, and Frisones, in sincient Geograply, a people of Germany, fo called cither from their ardent love of freedom, or from the frefh and unbroken lands they occupied, contradiatinguihed from the old lands. Tacitus divides them, from their extent of power and territory, into the Majores, tuated on the coalts between the Rhine and the Ems; and into the Minores, occupying the parts about the lakes lying between the chamels of the Rhine.

FRIT, or Fritt, in the glais manufacture, is the matter or ingredients wieere of glafs is to be made, when they have been calcined or baked in a furnace.

A falt drawn from the ahes of the plant kali or from fern, or other plants mixed with fand or thist, and baked together, makes an opaque mais called by glafmen frit; probably from the Italian fritare, to try; or becaufe the frit, when melted, runs into lumps, like fritters, called by the Italians friteli:

Frit, by the ancients, was called ammonirum, of a, eneos, fand, and wieov, nitre: under which name it is defcribed by Pliny thas: Fine fand from the Volturnian fea, mixed with three times the quantity of nitre, and melted, makes a mals called ammonirum; which being rebaked makes pere glafs.

Frit, Neri oblerves, is only the cals of the materials which make glafs; which, though they might be melted, and glals be made, without thus calcining them, yet it. would take up much more time. This calcining, or making of frit, ferves to mix and incorporate the ma-

## I F I [ 244 ] F R O

 tur ed into glals.11:cre are three kinds of frits. The frft, cryfal frit, or that for crytial mictal, is made with falt of pulverime and land. The fecond, and ordinary frit, is made of the hare afhes of fulverine or barilla, without extracting the falt from them. This makes the ordinary white or crythal metal. The third is frit for green stafle, made of con mon afhec, without any preparation. This lat frit will require ten or twelve hours hakin:-

The mateninls in each are to be findy powdered, wafh. 1 , and fearced; then equally mixed, and frequently ftirred together in the melting pot. See Glass.

FRITILLAR1A, fritilatiry : a genus of plants Longing to the hexandria clafs; and in the natural method renhing under the isth urder, Coronaria. See Lotasy Index.
The different fpecies of fritillary were, according to Beckman, introduced into gardens about the middle of the 16 th century. The crown imperial (fritillaria im. porialis) is fuppofed by fome to be the lily which is much celebrated in facred fcripture; becaufe a figure rciembling this fplendid plant, they imagine, is found reprefinted oa the coins of Herod. Invent. vol. iii.

FRIULI, a province of Italy, fubject to Venice, and bounded by Carinthia in Germany on the north, by Carniola on the eaff, by the gulf of Venice on the fouth, and by the Bellune'e and Feltrin on the wef.

FRIZE, or Fr'eze, in Architccture, a part of the entablature of columns, more ufually written and pronounced frecze. See Frefze.

Frize, or Freeze, in Commerce, a hind of woollen cloth or fluff for winter wear, being frized or knapt on one fide; whence, in all probability, it derives its name.

Of frizes, fome are crofled, others not croffed; the furmer are chiefly of Englifh manufacture, the latter of Irilh.

FRIZING of Cloth, a term in the woollen manufactory, applied to the forming of the nap of cloth or iluff into a number of little hard burrs or prominences, covering almoft the whole ground thereof.

Some cloths are only frized on the back fide, as black cloths; others on the right fide, as coloured and mixed cloths, rateens, bays, freezes, \&c.

Frizing may be performed two ways. One with the hand, that is, by means of two workmen, who conduct a Kind of plank that ferves for a frizing inftrument. The other is by a mill, worked either by water or a horfe, or fometinres by men. This latter is efteemed the better way of frizing, by seafon the metion being uniorm and regular, the little knobs of the frizing are formed more equably and regularly. The ilructure of this ufeful machine is as follows:

The three principal parts are the frizer or crifper, the frizing table, and the drawer or beam. The two firtt are two eru. 1 planks or boards, each aboat 10 fect fong and 15 incles broad; differing only in this, that the frizing talle is lined or covertd with a kind of coaric woolien finff, of a rough flurdy nap; and the frizer is incruilated with a kind of cement compofed of glue ymaraic, and a yellow fard, with a little aqu-vita, or urine The Le: on or drawer, than called,
becaufe it draws the fluff from between the frizer and the frizing table, is a wooden roller, befet all over with little, fine, ftuort points or ends of wire, like thofe of cards ufed in carding of wool.

The difpoition and ufe of the machine is thus: The table itands immoveable, and bears or fuitains the cloth to be frized, which is laid with that fide uppermoft on which the nap is to be raifed; over the table is placed the frizer, at fuch a diftance from it as to give room for the ttuff to be paffed between them: fo that the frizer, having a very flow lemicircular motion, mecting the long hairs or naps of the cloth, twitts and rolls them into little knobs or burrs; while at the fame time, the drawer, which is continually turning, draws away the ituff from under the fizer, and winds it over its own points.

All that the workman has to do while the machine is a-going, is to ftretch the fiuff on the table as falt as the drawer takes it off, and from time to time to take off the fluff from the points of the drawer.

The defign of having the frizing table lined with ftuff of a fhort, ftiff, thubby nap, is that it may detain the cloth between the table and the frizer long enough for the grain to be formed, that the drawer may not take it away too readily, which mult otherwife be the cafe, as it is not held by any thing at the other end. It were unnecefliary to fay any thing particular of the manner of frizing ituffs with the hand, it being the aim of the workmen to imitate, as near as they can with their wooden inftrument, the llow, equable, and circular motion of the machine: it needs only be added, that their frizer is but about two feet long and one broad; and that to form the nap more eafily, they moitten the furface of the fluff lightly, with water mingled with whites of eggs or honey.

FROBENIUS, Johs, a famous and learned printer in the 16th century, was born at Hamelburgh in Franconia, and fettled at Bafil. He had before ftudied in that univerfity, where he acquired the reputation of being uncommonly learned; and now fetting up a printing houfe in that city, was the firft of the German printers who brought that admirable art to any degree of perfection. Being a man of great probity and piety, as well as ikill, he was particularly choice in the authors he printed; and would never, for the fake of profit, fuffer libels, or any thing that might hurt the reputation of another, to go through his. prefs. The great character of this printer was the principal motive which induced Erafmus to refide at Bafil, in order to have his own works printed by him. A great number of valuable authors were printed by Frobenius, with great care and accuracy; among: which were the works of St Jerome, Augutine, and Erafmus. He defigned to have printed the Greek. Fathers; but died in 1527 , before he could execute his defign. Erafmus wrote his epitaph in Greek and Latin.
Juhn Frobenius left a fon named Yerome Frobenius, and a daughter married to Nicholas Epifcopius; who, joining in partnerfhip, continued Frobenius's printing houfe with reputation, and printed correct editions of the Greek Fathers.
frobisher, or Forbishle, Sir Martiy, an excelient navigator and fea officer in the 16 th century, was bonn near Doncafter in Yorkhine, and was from

Enguman who atiempted to find a north-weit pafGage to Cuins, and in 1576 ho lailes with two barks and a pinnace in order to attemet that parige. In this vovage lee cilcovered a cape, to which he gave the name of 2uecn Elizabeth's Forilond, and the nest day difcovered a itrat to which be gave hiv own name. This vorage proving unfuccelstul, he attempted the lame patiote in 1577, but dicovering fome ore in an inland. and his commilion directing him in this voyage only to fearch for ore, and to leave the farther dilcovery of the north-weit to another time, he returned to England. He lailed again, with 15 thips and a great number of adventurers, to form a fettlement: but being obftructed by the ice, and driven out to fea by a violent ftorm, they, after encountering many difficulties, retumed bome, without making any fettlement, but brought a large quantity of cre.- He atterwards commanded the Aid in Sir Francis Drake's expedition to the Weit Indies, in which St Domingo in Hipaniola, Carthagena, and Santa Juttina, in Floridn, were taken and facked. In 1588, he bravely exerted himfelf in defence of his country againit the Spanih armada, when he commanded the Triumph, one of the largeit fhips in that fervice; and, as a reward for his ditinguihed bavery, reccived the honomr of knightiood from the lord high adniral at fea. He afterwards comnianded a fquadron which was ordered to cruile on the Spanith coatt ; and, in 1592 took two valuable fhips and a rich carrack. In 5594 he was fent to the - Piftance of Henry IV. king of France againit a body of the Leaguers and Spaniards, who had ifrongly entrenched themfelses at Croyzon near Brett; but in an affault upon that fort, on the 7 th of November, Sir Martin was unfortunately wounded with a ball, of which he died foon after he had brought back the fleet to Plymouth, and was buried in that town.

Frobisher's Seraits, lie a little to the northward of Cape Earewell in Weft Greenland, and were dilcovered by Sir Martin Frobither. W. Long. 48. 16. N. Lat. 63. 12.

FRODSHAN, a town of Chehire in England, 162 miles from London, is noted for its ancient calle. It has a fone bridge over the river Weaver near its conflux with the Merfey, and a harbour for fhifs of good burden. By means of inland navigation, it has communication with the rivers Dee, Ribble, Oufe, Trent, Darwent, Severn, Humber, Thames, Avon, \&ic. which navigation, including its windings, extends above 500 miles, in the counties of Lincoln, Nottingbam, York, Lancafter, Weftmorland, Stafford, Warwick, Leicefter, Oxford, Worcefter, \&c.

## $\left.\begin{array}{l}\text { FROG. See Rana, } \\ \text { Bull Frog. See Rana, }\end{array}\right\}$ Ebpetology Inder.

Frog Fi/b of Surinam, a very fingular animal, of which a figure is given by Mr Edwards, Hi/h. of Birds, vol. i. There is no fpecimen in the Britith mufeum, nor in any private collection, except that of Dr Fothergill. It was brought from Surinam in S uth A-merica.-Frogs, both in Afia and Africa, according in Merian, change gradually from filhes, to frogs, as thofe in Europe; but after many years revert again into fithes, though the manner of their change has never been inveltigated. In Surinam thefe hities are called abjes. They are catilaginous, of a du'llance like our
 vaded i.w equal 1 wrin; ane mitt charhuth, and then gray : their lcales moke a leautitui appestance. Whe- ther this animal is, in it perfect tante, a lpectes of from with a tail, or a kind of water lizard, Mr Lhwards does not pretend to determine; but obferves, that when its lize is condered, if it thould be decmed a tadpole at firft produced from lpawn, and in its progrels townds a frog, fuch an animal, when full grown, if it bears the lame proportion to its tadpole as thole in Lurope do, muit be of enormous fizt ; for our full grown frogs exceed the tadpoles at leat jo times. See Erferology Inder.

FROMIE, a river that rifes from feveral fprings in the weltern parts of Dorfetthire in Englard, the principal of which is near Everthot; and direeting its courle almof due weft, pafles under Ftampton bridge, waihes the town of Dorchelter, and falls into a bey of the Englinh channel called Poothaven, near Wareham.

FROME-St/ewor, a town of Sumerfeth. in England, 150 miles from London. It is the chief town of this part of the country, which was anciently one great forcil called seluoodinire ; and in the Inter end of the lat centary, ia thofe called Frome lVordlands, there was a considerable gang of money comers or chipper, of whom many were taken and executed, and their covert laid open. Though the town is bigger than fome citie, yet it has only one church; but it has fix os feven meeting houles of Proteftant difenters. Ire inhabitants are reckoned about $13,2=0$, whole chice: manufactory is broad cloth. About 50 years apo. more wire cards for carding the wool fur the fipntace were made at this place than in all England belides, which was for the mon part furplied with them from hence; for here were no leis than 20 matter cardmakers, one of whom employed too men, women, and children, in that manufactory, at one time: io that even children of 7 or 8 year of ase couid carn half.a-coma a-week. The river here which abounds with tivut, eels, \&sc. riles in the woudlands; and runs under its ftone bridge towards Bath, on the calt lide of which it falls into the Aron. This town has bren a loas time noted for its fine beer, which they keep $t$, a great age, and is generally preferred by the genery to the wines of France and Portugal. It was governed tormerly by a bailiff, and now by two conitablen o: the hundreds of Frome, chofen at the court leet of the lord of the manor.

FRONDESCENTIA, from fron, " a leaf;"' the precife time of the year and month in which each fipecies of plants unfolds its firt teaves.

All plants produce new leaves every year; bue all do not renew them at the fane tiace imme wor dy plants, the elder, and motl the thomeytucklo-; .. mong perematitlerbs, the cro w, and tuif, ase the :- . thet puth or expand their lewer. ## F R O

Troant to extricate the lewes from their buds, and produce the apperance in ouefion.
Thi temperature, however, is not fo fixed or conitpat as it may appe:s to a luperficial obferver. Aman plants of the lame foecies, there are fome more early than others; whether that circumitance depends, as it inoll commonly does, on the nature of the plants, or is oning to differences in heat, expofure, and foil. In general, it may be affirmed, that fmall and young trees are always earlict ban larger or old ones.

I he punling of the 'caves is likewile accelerated or retarded according to the timperature of the feafon; that is, according as the fun is fooner or later in difpenting that certain degree of heat which is fuitable to each fpecies.
$\Rightarrow$ RONT, the forehead, or that part of the face above the eyebrows. The word is formed of the Latin frons; and that from the Greek $\varphi_{\varrho}$ oss:, " to think, perceive;" of qeav menr, " the mind, thought." Martimius, to make out this etymology, obferves, that from the forehead of a perfon we perceive what he is, what he is capable of, and what he thinks of.

Front is alfo ufed where feveral perfons or things are ranged fide by fide, and thow their front or fore parts.

Frost, in Architechure, denotes the principal face or fide of a building, or that prefented to their chief afpect or view.

FRONTAL, in Architecture, a little fronton or pediment, fometimes placed over a fmall door or window.

Frontal, Frontet, or Brow-band, is alfo ufed in fpeaking of the Jewifh ceremonies. This frontal confifts of four feveral pieces of vellum, on each whereof is written fome text of fcripture. They are all laid on a piece of a black calf's leather with thongs to tie it by. The Jews apply the leather with the vellum on their foreheads in the fynagogue, and tie it round the head with the thongs.

FRONTIER, the border, confine, or extreme, of a kingdom or province, which the enemies find in front when they would enter the fame. Thus we fay, a frontier town, frontier province, \&c. Frontiers were anciently called marches.

The word is derived from the French fromtiere, and that from the Latin frontaria; as being a kind of front oppofed to the enemy. Skinner derives fronticr from front ; inalimuch as the frontier is the exterior and moft advanced part of a ffate, as the front is that of the face of a man.

FRONTIGNIAC wine, is fo called from a town of Languedoc in France, fituated 16 miles fouth-weft of Montpelier, remarkable for producing it.

FRONTINAC, a fortrefs in Canada, fituated at the head of a fine harbour, on the north-weft fide of the outlet of Lake Ontario, where veffels of every defcription may ride in perfect fafcty. It is 300 miles from Quebec, and in comparifon of that place has a very fhort winter.

FRONTINUS, Sextus Julius, an ancient Roman writer, was of confular dignity, and tlourifhed under the emperors Vefpaiian, Titus, Domitian, Nerva, and Trajan. He commanded the Roman armies in Biitain; was made city protor when Vefpalian and Titus were confuls; and Nerva made him curator of the
aqueducts, which occafioned his writing De Aqueductibus urbis Roma. He wrote four books upon the Greek and Roman art of war; a piece De Re Agrarin, and another $D e$ Limitibus. Thefe have been often feparately reprinted; but were all collected together in a neat edition at Amfterdam in 1661, with notes by Robertus Keuchenius. He died uader Trajan.

FRONTISPIECE, in Archizecture, the principal face of a fine building. The word is formed of the Latin frontifpicium, q. d. frontis hominis in/pectio. Hence alio, by a figure, we fay, the frontifpiece of a book; meaning an omament with an engraven title on the firt page.

Frontlet. See Fromtal.
Fronto, Marcus Cornellus, was chofen for his eloquence to inftruct the emperors Marcus Aurelius and Lucius Verus in rhetoric; in recompenfe of which he was promoted to the confulate, and a flatue was crected to his honour. He taught Marcus Aurelius not only eloquence, but the duty of kings, and excellont morals. Some fay he wrote againtt the Chriftians. A feet was formed of thofe who looked upon him as a model of perfect cloquence, and thoie were called Frontoniani. The Civilians, whofe names were Fronto, mentioned in the Pandects, were probably defcended from him.

FROST, in Phyfiology, fuch a flate of the atmofphere as occafions the congelation or freezing of water and other fluids. See Cold, Chemistry Index, and Meteorology Index.

Water and other fluids are capable of containing the element of fire or heat in two very different flates. In the one, they feem to imbibe the fire in fuch a manner, that it eludes all the methods by which we are accuftomed to obferve it, either by our fenfation of feeling, or the thermometer; in the other, it manifefts itfelf obvioufly to our fenfes, either by the touch, the thermometer, or the emiffion of light.

In the firlt of thefe fates, we call the body cold; and are apt to fay that this coldnefs is occafioned by the abfence of heat. But this manner of exprelling ourfclves, excepting in a relative degree, is certainly improper ; for even thofe fluids which are coldeft to the touch contain a vaft deal of heat. Thus vapour, which is colder to the touch than the water from which it was raifed, contains an immenfe quantity of fire, even more than fufficient to heat it red hot. The like may be faid of common falt, and frow, or ice. If a quantity of each of thefe fubltances is feparately reduced to the degree of 28 or 30 of Fahrenheit's thermometer, upon mixing them together, the heat which would have raifed the thermometer to the degree above-mentioned, now enters into the fubflance of them in fuch a manner that the mercury falls down to o.-Here an excelive degree of cold is produced, and yet we are fure that he fubftances contain the very fame quantity of heat that they formerly did: nay, they will even feem exccedingly cold, when they muft certainly contain a great deal more heat than they originally did; for they abforb it from all bodies around them; and if a fmall velel full of water is put into the middle of fuch a mixiure, it will in a thort time be full of ice.

It appears, therefore, that our fenfec, even when affifted by thermometers, can only judge of the flate in which the element of fire is with relation to the bo-

Frantii.
$\mathrm{F} R \quad \mathrm{O} \quad\left[\begin{array}{lll}247\end{array}\right] \quad \mathrm{F} R \quad \mathrm{O}$

Frot. dies around us, without regard to the quantity contained in them. Thus, if heat flows from any part of our body into any fubllance actually in contact with it, the fenfation of cold is excited, and we call that fubftance cold ; but if it flows from any lubitance into our body, the fentation of heat is excited, and we call that fubftance lot, without regard to the abfolute quantity contained a either cale.

Of all known fubflances, the atmo@here either abforbs or throws out heat with the moft remarkable facility : and in one or other of thefe itates it always is with refpect to the furface of the earth, and fuch bodies as are placed on or near it ; for thefe, properly fpeaking, have no temperature of their own, but are entirely regulated by that of the atmofphere.-When the air has been for fome time abforbing the heat from terreftrial bodies, a froft mult be the undoubted confequence, for the fame reafon that water freezes in a vafel put into a freezing misture; and were this abforption to continue for a length of time, the whole earth would be converted into a frozen mafs. There are, however, certain powers in nature, by which this effect is always prevented; and the moth violent frolt we can imagine, mult always as it were defeat its own purpofes, and end in a thaw. To underliand this fubject, we mult obferve,
I. In that tlate of the atmofphere which we denominate froft, there is a moft intimate union between the air and the water it contains, and therefore frolty weather, except in very high latitudes, is generally clear.
2. When fuch a union takes place, either in winter or fummer, we obferve the atmofphere alfo inclined to abforb heat, and confequently to frok. Thus in clear fettled weather, even in fummer, though the day may be exceflively hot by reafon of the continued funftine, yet the mornings and evenings are remarkably cold, and fometimes even difagreeably fo.
3. The air being therefore always ready in the time of froft or in clear weather, to ablorb heat from every fubilance which comes into contact with it, it follows that it mult alfo abforb part of that which belongs to the vapours contained in it.
4. Though vapour is capable of becoming much colder than water without being frozen, yet by a continued abforption it muft at laft part with its latent heat, i. e. that which effentially conflitutes its vapour, and without which it is no longer vapour, but water or ice. No fooner, therefore, does the frolt arrive at a certain pitch, than the vapours, cyerywhere difperfed through the air, give out their latent heat : the atmofphere thea becomes clovided : the frolt either totally goes off, or becomes milder by reafon of the great quantity of heat difcharged into the air ; and the vapours defeend in rain, hail, or frow, according to the particular difpofition of the atmofphere at the time.
5. Even in the polar regions, where it may be thought that the froft mult increafic beyond meafure, there are alfo natural means for preventing its running to extremes. The principal cauf here is, the mixture of a great quantity of vapours from the more temperate regions of the globe with the sir ia thofe dreary climates. It is well known, that aqucous vapour alyays flies from a warm to a colder place. lor this
reafon, the vapours raifed by the fun in the more temperate regions of the earth, mult continually travel northward and fouthward in great quantities. Thus they furnifh materials for thofe immenfe quantities of fnow and ice which are to be found in the neighbourhood of the poles, and which we cannot imagine the weak influence of the fun in thefe parts capable of raiiing. It is impoffible that a quantity of vapour can be mixed with frofty air, without communicating a great deal of heat to it; and thus there are often thaws of confiderable duration even in thofe climates where, from the little intluence of the fun, we fhould fuppole the froft would be perpetual.
6. We may uow account with fome probability fo: the uncertain duration of frofts. In this country they are feldom of a long continuance; becaufe the vapours raifed from the fea with which our ifland is furrounded, perpetually mix with the air over the ifland, and prevent a long duration of the froft. For the fame reafon, frofts are never of fuch long duration in maritime places on the continent as in the inland ones. There is nothing, however, more uncertain than the motion of the vapours with which the air is conftantly filled; and therefore is is impolimble to prognotticate the duration of a frof with any degree of certaints. In general, we may always be certain, that if a quantity of vapour is accumulated in any place, no intenfe frof can fubfit in that place for any length of time; and by whatever caufes the vapours are driven from place to place, by the fame caufes the frofts are regulated throughout the whole world.

The effects of frott in different countries are enumerated under the article Congelation. In the northern parts of the world even folid bodies are li. able to be affected by froft. Timber is often apparently frozen, and rendered exceedingly dilficult to faw. Marl, chalk, and other lefs folid terreftrial concre. tions will be thattered by flrong and durable frofts. Metals are contracted by frolt: thus, an iron tube, 12 feet long, upon being expofed to the air in a frofty night, lott two lines of its length. On the contrary, frof fwells or dilates water near one tenth of its bulk. Mr Boyle made feveral experiments with metalline veffels, exceedingly thick and itrong; which being filled with water, clofe ftopped, and expofed to the cold, burf by the expanion of the frozen thuid with. in them. Trees are frequently deltroyed by froll, as if burnt up by the molt excelfive heat ; and in very ftrong frofts, walnut trees, aftes, and even oaks, are fometimes $f_{p}$ lit and cleft, fo as to be feen through, and this with a terrible noile, like the explofion of firearms.

Frolt naturally proceeds from the upper parts of bodies downwards : Lut how deep it will reach in earth or water, is not eafily known ; becaule this depth may vary with the degree of coldnefs in the air, by a longer or thorter duration of the frolt, the texture of the earth, the nature of the juices wherenith it is impregnated, the conditution of its more internal parts as to heat and cold, the nature cf its ellluvia, \&c. Mr Boyle, in order to alicertain this depth, after four nights of hard froft, dug in an orchard, where the ground was level and b.re, and found the froft had farce reached three inches and a half, and in a garden acarer the howe only two inches below the furface.

## F R O <br> [ 248 ] F R O

 Nine or ten fuccellive frofty nights froze the bare ground in the garden fix inches and a half deep; and in the orchard, where a wall theltered it from the fouth fun, to the depth of eight inches and a half. He alfo dug in an orcliard, near a wall, about a week afterwarks, and found the irof to have penetrated to the depth of $1+$ inclies. In a gatden at Mofoow, the frott in a hard feafon only penetrates to two feet: and the utmoit effect that Captain James mentions the cold to have had upon the ground of Charlion iiland, was to freeze it to 10 feet deep: whence may appear the different degrees of cold of that illand and Rusia. And as to the freezing of water at the above mentioncd iland, the Captain tells us, it dues not naturally congeal above the depth of tix fect, the reit being by accident. Water alio, expofed to the cold air in large vericls, alway freczes firlt at the upper furface, the ice gradually increaling and thickening downwards: for which reafon, frogs retire in frolty weather to the bottom of ditches; and it is faid, that thoals of fill setire in winter to thofe depths of the fea and rivers, where they are not to be found in fummer. Water, like the earth, feems not difpofed to receive any very intenfe degree of cold at a confiderable depth or distance from the air. The valt maffes of ice found is the northern feas being only many flakes and fragments, which, lliding under each other, are, by the congelation of the intercepted water, cemented together.In cold countries, the frof often proves fatal to mankind; not only producing gangrenes, but even death itfelf. Thofe who die of it have their hands and fect firf feized, till they grow paft feeling it ; after which the reft of their bodies is fo invaded, that they are taken with a drowfinefs, which, if indulged, they awake no more, but die infenfibly. But there is another way whereby it proves mortal, viz. by freezing the abdomen and vilcera, which on diffection are found to be mortified and black.

The great power of froft on vegetables is a thing fufficiently known; hut the differences between the frofts of a fevere winter, and thofe which happen in the fpring mornings, in their effects on plants and trecs, were never pelfeally explained, till by Meff. Du Hamel and Buffon in the Memoirs of the Paris Academy.

The frofts of fevere winters are much more terrible than thofe of the foring, as they bring on a privation of all the products of the tenderer part of the vegrtable world; hut then they are not frequent, fuch winters happening perlaps but once in an age ; and the frorts of the fpring are in reality greater injuries to us than thefe, as they are cuery year repeated.

In regard to trees, the great difference is this, that the frofts of fevere sinters affect even their wood, their trunks and large branches; whereas thole of the fpring have on's fower to hurt the buds.

The irinter frofls happening at a time when moft of the trees in our woods and gardens have neither leaves, Howers, nor fruits upon them, and have their buds fo hard an to be proof againit ilight injuries of weather, cpecinliy if the precediag fimmer has not been too wet; in thi 1 hatc , if there are no unlucky circumitanra'tendins, the generef:y of thecs hear moderate sinter very weil; but horl fiolis, which happen late
in the vinter, caule very great injuries even to thofe trees which they do not utterly dettroy. Thefe are, 1. Long cracks following the direction of the fibres. 2. Parcels of dead wood encloled round with wood yet i:1 a living ftate. And, 3. That ditemperatuse which the forefters call the double blea, which is a perfect circle of blea, or foft white wood, which, when the tree is afterwards felled, is found covered by a circle of hard and folid wood.

The opinions of authors about the expofition of trees to the different quarters, have been very different, and moft of them grounded on no rational foundation. Many are of opinion that the effects of froft are moft violently felt on thofe trees which are expofed to the north; and others think the fouth or the weft the moft itrongly aftected by them. There is no doubt but the north expofure is fubject to the greateft cold. It does not, however, follow from this, that the injury muft be always greateft on the trees expofed to the north in froits: on the contrary, there are abundant proofs that it is on the fouth fide that trees are generally more injured by froft: and it is plain from repeated experiments, that there are particular accidents, under which a more moderate froft may do more injury to ve. getables, than the moft fevere one which happens to them under more favourable circumitances.

It is plain from the accounts of the injuries trees received by the frofts in 1709, that the greatelt of all were owing to repeated falfe thaws, fucceeded by repeated new froils. But the frolts of the fpring feafon furnith abundantly more numerous examples of this truth ; and fome experiments made by the Count de Buffon at large in his own woods, prove inconteftably, that it is not the fevereft cold or molt fixed froft that does the greateit injury to vegetables.

This is an obfervation directly oppofite to the common opinion; yet is not the lefs true, nor is it any way difcordant to reafon. We find by a number of experiments, that humidity is the thing that makes froft fatal to vegetables ; and therefore every thing that can occafion humidity in them, expoles them to thefe injuries, and every thing that can prevent or take off an over troportion of humidity in them, every thing that can dry them though with ever fo increafed a cold, mult prevent or preferve them from thofe injuries. Numerou: experiments and obfervations tend to prove this. It is well known that regetables always feel the froit very feverely in low places where there are fogs. The plants which ftand by a river fide are frequently found deftroyed by the fpring and autumnal frofts, while thofe of the fame fiecies, which ftand in a drier place, fuffer little or perhaps none at all by them; and the low and wet parts of forelts are well known to produce worfe wood than the high and drier. The coppice wood in wet and low parts of common woods, though it $]^{\text {thith }}$ out more vigoroully at firlt than that of other places, yet never comes to fo good a growth; for the frofl of the fpring killing thefe early top dhoots, obiige, the lower part of the trees to throw out lateral branches : and the fame thing happens in a greater or lefier degree to the coppice wood that grows under cover of larger treas in great fouelts; for bere the rapours not being carrice off cither by the fun or wind, ftagnate and frecze, and in the fame manner deflow the young thoot, to the fogs of marlty places.

## F R O $\quad\left[\begin{array}{llll}249 & ] & \mathrm{F} & \mathrm{R}\end{array} \mathrm{O}\right.$

Eroti. It is a geners obfervation alfo, that the frof is never hurtful to the late choots of the vine, or to the flowerbuds of trees, except when it follows heavy dews, or a long rainy feafon, and then it never fails to do great nifchief, though it be ever fo tlight.

The froft is always obferved to be more mifchievous in its confequences on newly cultivated ground than in other places; and this is becaufe the vapours which continually arife from the earth, find an ealier paliage from thole places than from others. Trees alfo which have been newly cut, fuffer more than others by the fpring froits, which is owing to their fhooting out more vigoroully.

Frofts alfo do more damage on light and fandy grounds, than on the tougher and firmer foils, fuppoting both equally dry; and this feems partly owing to their being more early in their productions, and partly to their lax texture fuffering a greater quantity of vapours to tranfpire.

It alfo has been frequently obferved, that the fidethoots of trees are more fubject to perilh by the fpring frolts than thole from the top; and M. Buffon, who examined into this with great accuracy, always found the effests of the fpring frofts much greater near the ground than elfewhere. The fhoots within a foot of the ground quickly perihed by them; thofe which food at two or three feet high, bore them much better; and thofe at four feet and upwards frequently remained wholly unhurt, while the lower ones were entirely deftroyed.

There is a feries of obfervations, which have proved beyond all doubt, that it is not the hard frofts which fo much hurt plants, as thofe frofts, though lefs fevere, which happen when they are full of moilure; and this clearly explains the account of all the great damages done by the fevere frolts being on the fouth fide of the trees which are affected by them, though that fide has been plainly all the while lefs cold than the north. Great damage is alfo done to the weftern fides of trees and plantations, when after a rain with a welt wind the wind thifts to the north at funfet, as is frequently the cafe in fpring, or when an ealt wind blows upon a thick fog before funrifing.

Frolt, it is well known, is particularly deftructive to the bloffom of fruit trees. The following method of fecuring fuch trees from being damaged by early frofts may be acceptable to many of our readers. A rope is to be interwoven among the branches of the tree, and one end of it brought down fo as to be inmerfed in a bucket of water. The rope, it is faid, will act as a conductor, and convey the eftects of the froft from the tree to the water. This iden is not new, for the following paffage may be found in Colerus. "If you dig a trench around the root of a tree, and fill it with water, or keep the ronts moift till it has bloomed, it will not be injured liy the froit. Or, in fpring, fufpend a veffel filled with water from the trce. If you will to preferve the bioffom from being hurt by the frolt, place a veffel of water below it, and the froft will fall into it."

Hoar $F_{\text {ROST, }}$ a cold moil vapour, that is drawn up a little way into the air, and in the night falls again on the earth, where it is congealed into iey cryflals of various figures. Hoar frolt, therefore, is nothing but dew curned into ice by the coldnefs of the air.

Fol. IX. Part I,

Mctiorazion of Aromatic Spirtr by FRust. Mr Beaume obferves, that aromatic fipirituous waters have leds feent when newly dittilled than atter they have been kept about fix months: and he found that the good effect of age was produced in a thort time by means of cold; and that, by plunging guart bottles of the liquor into a mixture of pounded ice and fea falt, the firit, after having fuffered for lix or eight hours the cold lience relulting, proves as grateful as that which hath been kept many years. Simple uaters allo, atter having been frozen, prove far more agreeable than they were before. Geoffroy takes notice of this melioration by frolt. Mij? scad. 1713 .

Miliouation of Land by Frost. See Agricultere Index.

FROTH, a white light fubftance, formed on the furface of thuids by vehement agitation, confiling of air included in thin films of water.

Froth Spit, or Cuckuo Spit, a name given to a white froth, or fpume, very common ia the ipintg and firit months of fummer, on the leaves of certain plants, particularly on thofe of the common white field lychni, o: catchfly, thence called by fome /pating poppo.2.

All writers on vegetables have taken notice of this froth, though few have underftood the caule or origin of it till of late. It is formed by a little leaping animal, called by fome the fica gra/bopper, by applying its anus clofe to the leaf, and difcharging thereon a mall drop of a white vifcous fluid, which, containing fome air in it, is foon elevated into a fmall bubble : before this is well formed, it depofits fuch another drop; and fo on, till it is every way overwhelmed with a quantity of thefe bubbles, which form the white froth which we fee, Within this fpume it is feen to acquire four tubercles on its back, wherein the wings are erclofed: thefe buriting, from a reptile it becomes a winged animal : and thus, rendered perfect, it flies to meet its mate, and propagate its kind. It has an oblong, obtufe body, and a large head with fmall eyes. The external wings (for it has four) are of a dulky brown colour, marked with two white fpots: the head is black. It is a fpecies of Ctcada.

FROWDE, Philip, an Englih poet, was the fon of a gentleman who had been poltmatter in the reign of Queen Anne. He was fent to the univerlity of Oxford, where he had the honour of being diftinguilhed by Addifon, who took him under his protection. While he remained there, he became the author of feveral pieces of poetry, fome of which in Latin nere pure and cle. gant enough to entitle them to a place in the Mufe Anglicance. He likewife wrote two tragedies: The Fall of Saguntum, dedicated to Sir Robert Walpole; and Philotas, addreffed to the earl of Chetterfield. He died at his fodgings at Cecil street in the Strand, in $173^{8}$; and in the London Daily Poft had the following character given him: "Though the elegance of Mr Frowde', writings has recommended him to the general public etleem, the politenefs of his genius is the leaft amiable part of his character; for he efteemed the talents of wit and learning only as they were conducive to the excitement and practice of honour and humanity. Therefore, with a foul cheerful, benevolent, and virtuous, he was in converfation genteelly delightful, in friendihip punctually fincere, in death Chrittianly refigned. No man could live more beloved, no private

## F R U [ 2:0 ] F R U

Frateicen-mais could die more lamented." A fine eloge ! and we ${ }^{\text {tia }}$ have no reafon to doubt the truth of it.
Fruit. FRUCTESCENTIA, (from frugus, " frnit,") - comprehends the precife time in which, after the fall of the tiowers, the fruits arrive at maturity, and difperfe their feeds.

In general, plants which tlower in fpring, ripen their fruits in fummer, as rye; thole which Hower in fummer have their fruits ripe in autumn, as the vise;; the fruit of autumal tlowers ripens in winter, or the following fpring, if kept in a itove or othervife defended from exceftive frots. Thefe frofts, fitys M. Adandon, are fiequently fo pernicions and violent as to deftroy the greateft part of the perennial plants of Virginia and Millifippi, that are cultivated in France, even before they have exhibited their fruit. The plants which flower during our winter, fuch as thofe of the Cape of Good Hope, ripen their fruit in (pring in our ilowes.

FRUCTIFEROUS, fignifies properly any thing tiast produces fruit.

FRUCTIFICATION of plants, is defined by Linneus to be the temporary part of a vegetable appropriated to generation, terminating the old vegetable, and begining the new. It confits of the following feren parts; viz. the calys, corolla, itamen, piftillum, pericarpium, femen or feed, and receptaculum. See Botariy.

FRUIT, in its general fenfe, includes whatever the earth produces for the nourimment and fupport of animals; as herbs, grain, pulfe, hay, com, and tiax, every thing exprefled by the Latins under the name frues.

Fruit, in Naiural Hifory, denotes the laft production of a tree or plant, for the propagation or multiplication of its kind; in which fenfe fruit includes all kinds of feeds, with their furniture, \&c.

Fruit, in Botany, is properly that part of a plant wherein the feed is contained; called by the Latins $f_{r l o f l u s ; ~ a n d ~ b y ~ t h e ~ G r e e k s ~ a c e g \pi o s . ~ T h e ~ f r u i t ~ i n ~ t h e ~}^{\text {a }}$ Linntan fyttem is one of the parts of fructification, and is difinguifhed into three parts, viz. the pericarpium, feed, and receptacle, or receptaculum feminum. See Botany.

Colours extracted from $F_{R U I T}$. See the article Co-s.OUR-Making.

Bread-Fruit. Sce Artocarpus, Botany Index.
Fruits, with regard to commerce, are diftinguilhed into recent, fre $\beta$, and dry.

Recont Fruits are thole fold juit as they are gathered from the tree, without any farther preparation; as are mott of the productions of our gardens and orchards, fold by the fruiterers.

Dry Fruits are thofe dried in the fun, or by the fire, with other ingredients fometimes added to them to make them keep; imported chietly from beyond fea, and fold by the grocers. Sucb are raifins, currants, figs, capers, olives, cloves, nutmegs, pepper, and other fipices; which fee under their refpective articles.

Under the denomination of $d r y$ fruits are alfo frequently included apples, pears, almonds, filberds, \&c.
$F_{\text {RUit-Flies, }}$ a name given by gardeners and others to a fort of fmall black fies found in vaft numbers among fruit trees, in the fpring feafon, and fuppoled to do great injury to them. Mr Leeuwenhoeck preferved
fome of thefe flies for his microfcopical obfervations, He found that they did not live longer than a day or two, but that the females during this time laid a great number of longill eggs. The gardeners who fuppofe that thefe flies wound the leaves of the trees, are miftaken: it is true that they feed on their juices; but they have no inftruments wherewith they can extract thele for themfelves: they feed on fuch as are naturally extravafated; and when there is not a fufficient quantity of thefe for their purpole, they haunt the places to which the pucerons refort, and feed on the juices which thefe little creatures extravalate by means of the holes they bore in the leaves with their trunks.

Fruit Stones. The mifchiefs ariling from the cuftom which many people have of fuallowing the ftones of plums and other fruit are very great. The Philofophical Tranfactions give an account of a woman who fuffered violent pains in her bowels for 30 years, returning once in a month or lefs. At length, a ftrong purge being given her, the occafion of all thefe complaints was driven down from the bowels to the anus; where it gave a fenfation of ditenfion and itoppage, producing a continual defire of going to ftocl, but without voiding any thing. On the affiftance of a careful hand in this cafe, there was taken out with a forceps a ball of an oval figure, of about ten drachms in weight, and meafuring five inches in circumference. This had caufed all the violent fits of pain which the had fuffered for fo many years; and, after voiding it, fhe became perfectly well. The ball extracted looked like a ftone, and felt very hard, but it fwam in water. On cutting it through with a knife, there was found in the centre of it a plum flone; round which feveral coats of this hard and tough matter had gathered. Another inftance given in the fame papers is of a man, who, dying of an incurable colic which had tormented him many years, and batfled the effects of medicines, was opened after death; and in his bowels was found a ball fimilar to that above mentioned; but fomewhat larger, being fix inches in circumference, and weighing an ounce and a half. In the centre of this, as of the other, there was found the ftone of a common plum, and the coats were of the fame nature with thofe of the former.

Thefe and feveral other inftances mentioned in the fame place, fufficiently fhow the folly of that common opinion that the ftones of fruits are wholefome. For though by nature the guts are fo defended by their proper mucus, that people very feldom fuffer by things of this kind; yet if we confider the various circumvolutions of the guts, their valves and cells, and at the fame time confider the hair of the \{kins of animals we feed on, the wool or down on herbs and fruit, and the fibres, veffels, and nerves of plants, which are not altered by the flomach; it will appear a wonder that inflances of this fort of mifchief are not much more common. Cherry ftones, fwallowed in great quantities, have occafioned the death of many people; and there have been initances even of the feeds of Itrawberries collecting into a lump in the guts, and caufing violent diforders, which could not be cured without great difficulty.
$F_{\text {RUI }}$ Trecs. With regard to thefe it may be obferved, 1. That the cutting and pruning them when young hurt their bcaring, though it contributes to

Fruitery the richnefs and flavour of the fruit, as well as to the
when the top 1 cut ofi by a plane parallel to the Late; and is otherwife called a truncated cunc. See losia Sctions.

The frufum of a pyramil is alfo what reminns after the top is cut off by a plane parallel to its bafe.

The fruitum of a globe or fiphere is any part thereof cut oft by a plane, the folid contents of which may: be found by this rule: To three times the fipuare o: the femidiameter of the bafe add the fiquare of its height; then multiply that fum by the height, and this product multiplied Iy 5236 gives the folidity o: the fruftum.

FRUTEX, a sureb. Shrubs, according to Li: meus, make a branch of the leventli family in the vo getable kingdom; and are diltinguifhed from trees, i: that they come up without buds. But this dillinction: is not univerfal, though it be generally juft with regand to thofe of Europe. Nature hath made no abfolute difinction betwech trees and thrubs. Frutex, in is general acce tation, is a plant whofe truak is perennial, gemmiparous, woody, dividing and fubdividing into a great number of braither. In mort, it is the epitome of a tree, exemplified in the rofe buts.

FRY, in Zoology, fignifies the frawn, or rather young, of fifh.

FRVING-f.Ax, a dangerous fhoal, which has received this appellation from its figure. It is fituated at the entrance of Cape Fear river, in North Carolina, the fouthern part of which is in $33^{\circ} 22^{\prime}$ N. Lat. $24^{2}$ miles fouth-ealt by fouth of the light-houfe on Bald Head.

FRYTH, Johs, a martyr to the Proteflant religion in the reign of Henry VIII. He was the fon of an innkeeper at Seven Oaks in Kent; and educated in King's college, Cambridge, where he took the degree of bachelor of arts. Thence he removed to Oxford, and was made a junior canon of Wolley's college. He had not been long in this univerfity before he became acquainted with William Tyndale, a zealous Lutheran, with whom he converfed frequently on the abufes in religion. Fryth became a convert to Lutheranifm, and publicly avowed his opinions. He waw apprehended, examined by the commiflary, and confined to his college. At length having obtained his liberty, in 1528 he went over to Germany, where he continued about two years; and then returned to England, more than ever determined in his religious fentiments. Finding at that time but few allocinte, he wandered about from place to place, till at laft hi was taken up at Reading as a vagrant, and $f($ e: ia the Itocks, whese he remained till he was near expiring for want of fuftenance. He was at length rclieved by the humanity of Leonard Cox, a fchoolmailer; who finding him a man of letters, procured lis enlargement, and adminiftered to his necellitiec. Fryth now fet out for London, where, with more zeal thom prudence, he began to make profeclytes; but was foon apprehended by order of the chancellor Sir Thomas More, and fent prifoner to the tower. Refufing to recant his opinions, he was condemned to the flames, and accordingly burnt in Smithfield, on the $4^{\text {th }}$ of July 153.3 . He left feveral works behind him, which were printed in folio in 1573 .

FUAGE, in old Englih writere, a tax of 12 d . for every fire, levied in the time of F.dward III.

by the firft, before they come to any fit age for bearing, being one with another five years; but when they do begin, they bear in greater plenty than flone fruit. 3. That ftone fruit, figs, and grapes, commonly bear confiderably in three or four years, and bear full crops the fifth and fixth year; and hold it for many years, if well ordered. 4. That fruit trees in the fame neighbourhood will ripen a fortnight fooner in fome grounds than in others of a different temperature. 5. That in the fame country, hot or cold fummers fet confiderably forwards, or put backwards, the fame fruit. 6. That the fruit on wall trees generally ripen before thofe on Randards, and thofe on flandards before thofe on dwarfs. 7. That the fruit of all wall trees planted in the fouth and eaft quarters commonly ripen about the fame time, only thofe in the fouth rather earlier than thofe in the eatt; thofe in the welt are later by eight or ten days; and thofe in the north, by 15 or 20. For the planting, pruning, grafting, \&c. of fruit trees, fee Gardentig.

FRUITERY, a place for the keeping of fruit, a fruit houfe, or fruit loft.

A fruitery fhould be inacceffible to any thing of moifture; and fhould be as much as poffible fo, even to froft.

FRUMENTACEOUS, a term applied by botanifts to all fuch plants as have a conformity with wheat, in refpect of their fruits, leaves, ears, or the like.

FRUMENTARII, a kind of foldiers or archers under the weltern empire.

The firit time we read of thefe officers is in the reign of the emperor Adrian, who made ufe of them to inform himfelf of whatever paffed. They did not make any particular corps diftinct from the reft of the forees, but there was a certain number of them in each legion. It is fuppofed, that they were at firt a number of young perfons, difpofed by Augulus throughout the provinces, particularly on all the grand roads, to acquaint the emperor, with all expedition, of every thing that happened:

Afterwards they were incorporated into the troops themfelves, where they itill retained their ancient name. As their principal office was the giving intelligence, they were often joined with the curioli, with whom they agreed in that part of their olice.

Their name of frumentarii is derived from their bcing alfo a fort of purveyors to the armies, cities, \&c. collecting all the corn from the feveral provinces to furnifh the commonwealth.

FRUMENTATION, in Roman antiquity, a largefs of corn bettowed on the pcople. This practice of giving corn to the people was very ancient among the Romans, and frequently ufed to fiothe the turbulent humour of the populace. At firit the number of thofe to whom this largefs was given was indeterminate, till Auguflus fixed it at $2=0,000$.

FrUSH, or Runsisg Thrush. Sec Farrieky Index.

FRUSTUM, in Mathenatics, a part of fome folid body feraratel from the rett.
the frotum of a cone is the part that remains,

## F U C [ 252 ] F U E

 the Abruzzo Ultra, in the kingdom of Naples, near the Apennines. This lake was under the protection of a god of the fame denomination, whofe temple flood on its banks. According to the teltimony of ancient autthors, it was fubject to extraordinary rifings and decrealings. The actual circumference is 47 miles: the breadth in the widelt part is 10 , in the narroweft 4 ; its depth 12 feet upon an average. But all thefe have varied prodigioully. Two miles up the plain, behind Avezzano, the fragments of boats, hells, and other marks of its ancient extent, have been cafually difovered: and, on the contrary, there are people who remember when it did not flow nearer than within two niniles of Avezzano. An immenfe tract of excellent lands is loft at every increafe of its level. All round this noble piece of water rifes a circle of grand mountainc, fome of them the higheil in Italy, if we except the $A \mathrm{p}$ ps, and many of them covered with fnow ; and at the foot of them are numerous villages, with rich and well cultivated farms. The environs of the lake, Mr Swinburne defcribes as all well enclofed, and the dides of the hills as covered with fine woods; its waters abound with fith of various kinds, and thither repair at 1tated feafons innumerable tlights of wild fowl. As the fwelling of the lake was attended with incredible damage, the Marfi had often petitioned the fenate to drain it : Julius Cetfar would have attempted it, had he lived longer. His fuccefiors were averle to the project ; till Claudius, who delighted in expenfive difficult enterprifes, undectook it. During the fpace of 11 years he employed $3^{0,000}$ men in digging a paffage through the mountain ; and when every thing was ready for letting off the water, exhibited a fuperb naval fectacle on the lake. A great number of condemned criminals were obliged to act the parts of R hodians and Sicilians in feparate fleets, to engage in earnefl, and to deftroy ne another for the entertainment of the court and the multitude of fpectators that covered the hills: A line of well armed veffels and rafts loaded with foldiers furrounded the fcene of action, in order to prevent any of the wretches from efcaping; but it was with great difficulty and many threats that they could be brought to an engagement. When this favage diverfion was ended, the operations for opening the paffage commenced, and the emperor was very near being fivept away and drowned by the fudden rulking of the waters towards it. However, either through the ignorance or negligence of the engineers, the work did not anfwer as was expected, and Claudius did not live long enough to have the faults antended: Nero abandoned the fcheme through envy. Hadrian is faid to have let off the waters of the Fucinus; but none now efcape except through hidden channels formed by nature, which are probably fubject to be obitructed, and thus occation a fuperabundance of water in the lake, till fome unknown caufe removes the obiftructions and again gives free paffiage.
Sir William Hamilton, who vifited the Fucinus in 1785 , lays, "it is the moft beautiful take he ever faw, and would be complete if the neighbouring mountains viere better wooded." It furnifhes abundance of fill, though not of the beft quality. There are a few large trout, but moftly tench, barbel and dace. In the
fhallow water on the borders of the lake, he faw thoufands of water frakes purfuing and preying upon a little kind of fifl like our thornbacks, but much better armed; though their defenfive weapons feemed to avail them but little againit fuch ravenous foes. The opening made by Claudius he defcribes as ftill entire, though, in many parts, filled with earth and rubbilh. He went into it with torches as far as he could. It is a covered underground canal three miles long, and part of it cut through a hard rock; and other parts fupported by mafon work, with wells to give light. Hadrian is faid to have let off the waters of the lake: and our author is of opinion, that if the canal were cleared and repaired, it would itill anfwer that purpofe, and thereby reftore a great deal of rich land fit for cultivation.

FUCUS, a name given by the ancients to certain dyes and paints. By this name they called a purple fea plant uled by them to dye woollen and linen things of that colour. The dye was very beautiful, but not lafting; for it foon began to change, and in time went wholly off. This is the account Theophratus gives of it.

The women of thofe times alfo ufed fomething called fucus, to flain their cheeks red; and many have fuppofed, from the fame word exprelling both, that the fatne fubfance was ufed on both occafions. But this, on a ftrict inquiry, proves not to be the cafe. The Greeks called every thing fucus that would itain or paint the flefh. But this peculiar fubftance ufed by the women to paint their cheeks was dillinguifhed from the others by the name of rizion among the more correct writers, and was indeed a root brought from Syria into Greece. The Latins, in imitation of the Greek name, called this root radicula; and Pliny very erroneoully confounds the plant with the radix lunaria, or Aruthion of the Greeks.

The word fucus was in thofe times become fuch an univerfal name for paint, that the Greeks and Romans had a fucus metallicus, which was the cerufe ufed for painting the neck and arms white; after which they ufed the purpuri/fum, or red fucus of the rizium, to give the colour to the cheeks. In after-times they alio ufe a peculiar fucus or paint for the purpofe, prepared of the creta argentaria, or filver-chalk, and fome of the rich purple dyes that were in ufe at that time: and this feems to have been very little different from our rofe-pink; a colour commonly fold at the colour-hops, and ufed on like occafions.

Fucus, in the Limmean fyftem of botany, is a genus of the order of algat, belonging to the cryptogamia clafs of plants.

FUEGO, or Fogo, one of the Cape de Verd iflands, in the Atlantic ocean. It is much higher than any of the relt ; and jeems, at fea, to be one fingle mountain, though on the fides there are deep valleys. There is a volcano at the top which burns continually, and may be feen a great way off at fea. It vomits a great deal of fire and finoke, and throws out huge pieces of rock to a valt height ; and fometimesturrents of melted matter run down the fides. The Portuguefe, who firtt inlabited it, brought negro tlaves with them, and a flock of cows, horfes, and hogs; but the chief inhabitants now are blacks, of the Romith religion. W. Long. 24.47. N. Lat. 15. 20.

Fucu: Fuega

## F U G $\quad[253] \quad$ F U G

Fuel FUEI, whatever is proper to burn or make a fire; as wood, turf, peat, bituminous earths, coal, \&ic.

FUEN-Hol, a city of China, in the province of Pc-tcheli, celebrated for its extent and the number of its inhabitants, as well as for the beauty of its ftreets and triumphal arches. It is fituated near the great wall, amidit mountains; and has under its jurifdiction, befles two cities of the fecond, and eight of the third clafs, a great number of fortrefles, which bar the entrance of Clina againit the Tartars.

FUGALIA, in Roman antiquity, a feast fuppofed by fome to be the fame with the refugium, held on the 2 th of February, in memory of the expulion of the kings and the abolihhing of monarchical government. Others again ditinguith the fugalia from the regifuge. And others think, that the fugalia was the fame with the poplifugia, or the fealt of Fugia, the goddefs of joy, occalioned by the rout of an enemy, which was the reafon the people abandoned themfelves to riot and debauchery.

FUGITIVE, a perfon obliged to fly his country, or remove from a place where he had fome abode or eitablifhment, on account of his crimes, debts, or other occafions.

Fugitive Piecer, among the learned, denote thofe little compofitions which are printed on loofe theets or half theets; thus called, becaufe eafily lolt and foon forgutten.

FUGUE, in Mu/uc (from the Latin fiuga, " a chafe"), a piece of mufic fometimes longer and fome. times horter, in which, agreeable to the rules of harmony and modulation, the compoler treats a fubject ; or, in other words, what expreffes the capital thought or fentiment of the piece, in caufing it to pafs fucceffively and alternately from one part to another.

Thefe are the principal rules of the fugue; of which fome are peculiar to itfelf, and others common to it with what the French call imitation.

1. The fubject proceeds from the tonic to the dominant, or from the dominant to the tonic, in riting or defending.
2. Every fugue finds its refponfe in the part immediately following that which commenced.
3. That refponfe ouzht to refume the fubject in the interval of a fourth or fith above or below the key, and to purfue it as exactly as the laws of harmony will admit; proceeding from the dominant to the tonic when the fubject is introduced from the tonic to the dominant, and moving in a cuntrary direction when the fubject is introduced from the dominant to the tonic. One part may likewife refume the fame fubject in the octave or unifon of the preceding; but in that cale, it is a repetition rather than a real refponfe.
4. As the octave is diviled into two unequal parts, of which the one contains four gradations defcending from the tonic to the dominant, and the other only three in continuing the afcent from the dominant to the tonic; this renders it neceflary to have fome regard to this change in the expreflion of the fubject, and to mike fome aitcrations in the refponfe, that we may not quit the cords that are efiential to the mode. It is a different cafe when the compofer intends to alter the modulation; for there the exactnefs of the refponfe itielt, when taken in a different tone, frodaces the alteration proper for this change.
5. It is necentary that the furue fhoull be plarered in fuch a manner, that the refinfe myy cunnence before the clofe of the fritt air, io th. t both, then one and the other may be in patt heard a! tie fame time: that, by this anticipation, the furject, foy he as it were connected with itfelf, and that the art of the compeler moy difcover itfelf in this concourle. It is abfolute mockery, inftead of a fugue, to impofe upon the hearers the finie air, merely traufpofed from one key to another, without any other reftraint than an accompatiment itterwards formed at pleafure. This delerves at bent r:o better name than what the French call imitation, bet. Imitation.

Befides thefe rules, which are fundamental, there are others which, though prefcribed by tatte alone, are m. lefs effential. Fugues, in general, render mutic more noing than agreeable; it is for this reafon that they are mone agreeable in the chorws than anywhere elle. Now, a their chief merit confilts in fixing the ear on the principal air or fubject, which for this reafon is made tu pafs inceffantly from part to part, and from mode to mode, the compofer ought to exert his care in preferving that air always dittinct ; or to prevent it from being abforbed in, or confuunded with, the other part., To produce this effect, there are two different ways; one is the movement, which muft be incelfantly contratted with itfelf; fo that, if the procedure of the fugue be accelerated, the other parts more gravely and with protracted notes; or, on the contrary, if the mo. tion of the fugue be flow and folemn, the accompani ments muft have more and quicker bufinefs. The other method is to extend the harmony, by removing the parts at a greater diftance one from the other; leit the others, too nearly approximated to that which contains the fubject, thould be confounded with it, and prevent it from being diftinguifhed with futficient clearnels; fo that what would be an imperfection anywhere elfe, becomes here a beauty.

The unity of melody fhould be preferved: this is the great and general rule, which muft frequently be practifed by different means. The chords mut be chofen, and the intervals, fo that one particular found may produce the chief effect ; this can only refult from the unity of the melody. It will fometimes be neceffary to employ voices and inftruments of different kind, that the parts which ought to prevail may be molt eafily diftinguifhed; this again itows the neceflity ot preferving the unity of the melody. Another object of attention, no lefs neceflary, is, in the different connections of modulation which are introduced by the procedure and progrefs of the fugue, to caule all thes modulations to correfpond at the fame time in all the parts, to connect the whole in its progrefs by an caact conformity of modes; left, if one part be in one mode. and another in another, the general harmony thould tio in none at all, and for that reaion thould no longer be able to produce fimple effects upon the ear, nor timple ideas in the mind; which is anotlier reafon for preferving unity of melody. In a word, in every fugue th. confufion of melodies and modulations is at once what a compofer has mol to fear, and will find the greateit difficulty in avoiding; and as this hiud of mufie never produces a pleafure above mediocrity, one may fyy that a fine fugue is, though the materpies of an excillc.a harmoniff, ungrateful to his toil.

## F U L [ $25+] \quad$ F U L

Gorst.

There are itill fceeral other kinds of fugues; fuch as the perpetual fugue *, the doable fugue, the inverted fugue.
The inverted fugue is a manner of compofition, in which the flying part proceeds in a contrary direction to the other fugue, which had been formerly fixed in the fame piece of mulic. Thus, when the firt fugitive part is heard in afcending from the tonic to the dominant, or from the dominant to the tonic, the counter fugue ought to be heard in defcending from the dominant to the tonic, or from the tonic to the dominant, and vice vererfa. Its other rules are exactly like thofe of the common fugue.
FULCRUMI, in Meckanics, the prop or fupport by which a lever is fuftained.

FULDA, a confiderable town of Germany, in the circle of the Upper Rhine, and in the Buchow, with a celebrated abbey; whofe abbot is primate of the abbeys of the empire, perpetual chancellor of the emperor, and fovereign of a fmall territory lying hetween Heffe, Franconia, and Thuringia. It is feated on the river Fulda, 55 miles fouth of Caffel, and 58 north-eaft of Francfort. E. Long. 9. 53. N. Lat. 50. 40.

FULGOR A, a genus of infects belonging to the order of hemiptera. See Entomology Index.
FULHAM, a village of Middlefex, four mile: from London. The Danes in 869 wintered at this place fill they retired to the continent. It was in the Conqueror's time held of the king by the canons of St Paul's; and there is an ancient houfe here, which is moated about, and belongs to the fee of London, whofe bihop has a palace here, and the demefne has belonged to that diocefe from 1067 . From this place to Putney there is a wooden bridge over the Thames, where not only horfec, coaches, and all carriages, but even foot paffengers, pay toll. The church here is both a rectory and a vicarage.
FUlica, the gallinule and coot, a genus of birds belonging to the order of gralle. See Orvithology Index.
FULIGINOUS, whatever proceeds from a thick footy fmoke, fuch as lamp black.

FULIGNO, a city of Italy, in the popc's territories, 10 miles north of Spoletto.

FULIGO, in Natural Hifory, a fpecies of pumiceftone. See Pemice.

FULLER, Dr Thomas, a learned Englifh divine, was born at Alvinckle, near Oundle, in Northamptonfhire, about the year 1608, and fudied at Cambridge. He was chofen minifter of St Bennet's there; and at about 23 years of age, his merit procured him a fellowthip in Sidney-college, and a prebend in Salibury cathedral. He was foon after prefented to the rectory of Broad Windfor in Dorfethire ; and afterwards was made leeturer of the Savoy in London: but upon the prefing of the covenant, he retired to Oxford; and foon after accompanied Sir Ralph Hopton as his chaplain in the army, which be attended in their marches from place to place. After the death of King Charles I. he obtained the living of Waltham-abbey, and was appointed lecturer of St Clement's; and fhortly after removed to the lecture of St Bridge"s, Fleet-flrcet. Upon the refloration, be recovered his prebend in the cathedral of Saliffury, was appointed -hanlain extraordinary to his majelly, and createt
doctor of divinity. It is faid, his memory was fo teracious and comprehemive, that he could make ufe of a fermon verbation if he once heard it He once underiook, in palting to and from Temple-bar to the Poultry, to tell at his retarn every fign as it flood in order on toth fides of the way, repeatung them either backwards or forwards; and this tank be actually performed. He wrote, I. A Hilloy of the Holy War. 2. The Church-Hiftory of Britain, in folio. 3. Andronicus, or the Unfortunate Politician, in 8 ro. ${ }_{4}$ A Pifgah-fight of Palettine. 5. A Hillory of Euglifh Worthies; and other works.. He died in Auguit 1661; and was interred in the chancel of Cranford church, in Middlefex, whither his body was attended by at, leat 200 of his brethren of the miniltry.
Fuller, a workman employed in the woollen manufactories to mill or fcour cloths, ferges, and other ftutfs, in order to render them more thick, compact, and durable. See Fulling.

Fuller's Earth, in Natural Hifory, a ppecies of clay, of a grayih aht-coloured brown, in all degrees from very pale to almoft black, and it has generally fomething of a greenifh caft. It is very hard and firm, of a compact texture, of a tough and fomewhat duity furface that adheres llightly to the tongue. It is very foft to the touch, not ftaining the hands, nor breaking eafily between the fingers. It has a little harflnefs between the teeth, and melts freely in the mouth. Thrown into water, it makes no ebullition or hiffing; but fwells gradually in bulk, and falls into a fine fott powder. It makes no effervefcence with aquafortis.

The greatelt quantity and the fineft earth of this kind in the world, is dug in the pits at Wavedon, near Woburn in Bedfordhhire. The itrata in thefe pits lie thus: From the furface to the depth of fix feet, there are feveral layers or beds of fand, all reddifh, but fome lighter coloured than others. Under thefe there is a thin ftratum of a fand-itone, which they break through, and then there is the fuller's earth. The upper ftratum of this is about a foot thick : the workmen call it cledge, and throw it afide as ufelefs; being commonly fouled with the fand which originally covered it, and which infinuates itfelf a good way into it. After this, they come to the fine fuller's carth for fale, which lies to the depth of cight feet more. The matter of this is divided into feveral layers, there being commonly about a foot and an half between one horizontal fiffure and another. Of thefe feveral layers, the upper balf, where the earth breaks itfelf, is tinged red; which fecms to be owing to the running of the watcr upon it from among the fands above; fome of which are probably of a ferruginous naturc, or have ferruginous matter among them. This reddifh fuller's earth the workmen call crop; and between the cledge and this there is a thin ftratum of matter, of lefs than an inch, which in tafte, colour, and external appearance, refembles the terra Japonica of the flops. The lower half of the ftrata of fuller's earth they call wall-earth. $T$ his is untinged with the red colour of the other, and feems the moft proper for fulling. Under the fuller's earth there is a fratum of white and coarfe flone about two feet thick. They feldom dig through this; but if they do, they find more tlrata of fand.
This earth is of great ule in icouring cloths, fuffe, \&ec. imbibing all the greafe and oil ufed in preparing,

a contraband commodity, and is not to be exported under the penalty of ts. for every pound weight. Sce

Fuling.

Filler*s Itać, or Teazle. See Disticus, Botany Inler.

FULLERY, a place where cloths, \&ic. are fulled. See the next article.

FULLING, the art or act of clemfing, foouring, and pretling eloths, ftuffs, and itockings, to render them itronger, cloler, and firmer: called alfo milling. Pliny (lib vii. cap. 56.) afleres, that one Nicias, the fon of Hermias, was the firf inventor of the art of fulling: and it appears by an infcription, quoted by Sir G. Wheeler, in his Travels through Greece, that this fame Nicias was a governor in Grecce in the time of the Romans.

Fulling of woollen cloths, depends, like feking, fo entirely upon the Atructure of wool and hair, that thofe who have read our account of that procefs, will not

- find it difficult to comprehend the following obfervations.

The afrerities with which the furface of woul is everywhere furrounded, and the difpofition which it has to afilume a progrefife motion towards the root, render the fipining of wool, and making it into cloth, dificult operations. In o=der to fin worl, and afterwards convert it into cloth, its fibres mont be covercd with a coating of oil, which, filling the cavities, renders the afnerities lefs ientible; in the fame way as oil renders the furface of a very fine fle lefs rough, when rubbed over it. When the piece of cloth is finifhed, it mult be cleanfed from this oil; which would caufe it to foil whatever it came in contact with, beffes giving it a difagreeable fmell, and prevent its taking the colour which is intended to be given to it by the dyer. To deprive it of the oil, it is carried to the fulling-mill, where it is beat with hammers in a trough full of water, in which fome clay has been mixed; the clay combines with the oil, which it feparates from the cloth, and both together are wathed away by the frelh water which is brought to it by the machine; thus, after a certain time, the oil is entirely waihed out of the cloth.

But the frouring of the cloth is not the only object in fulling it ; the alternate preflure given by the mallets to the piece of cloth, occafions, efpecially when the fcouring is pretty far advanced, an effect analogous to that which is produced upon hats by the hands of the hatter; the fibres of wool which compofe one of the threads, whether of the warp or the woof, affume a progrelive movement, introduce themfelves among thofe of the threads nearelt to them, then into thole which follow ; and thus, by degrees, all the threads, both of the warp and the woof, become feited together. The eloth, after having, by the above means, become Gurtened in all its dimenfions, partakes both of the nature of eloth and of that of felt; it may be cut without being fubject to ravel, and, on that account, we are not obliged to hem the edges of the pieces of which clothes are made. Laftly, as the thread\% of the warp and thole of the noof are no longer fo dittinct and feparated from each other, the cloth, which has acquired a greater degree of thicknefs, furms a warmer clothing. Knit wortted alfo is, by fulling, rendered lefs apt to sun, in cafe a ftitch thowd happen to drop in it.

The fulling of cloths and other fuffs is performed Fulli:\%. by a kind of water-mill, thence called a fulling or foouring mill.

Thefe mills, excepting in what relates to the millflones and hopper, are much the fane with corn mills: and there are even fome which ferve indifferently for either ufe: corn being ground, and cloths fulled, by the motion of the fame wheel. Whence, in fome places, particularly in France, the fullers are called millirs; a; grinding corn and milling flufis at the fame time.

The principal parts of the fulling-mill are, The wheel, with its trundle; which gives motion to the tree or fyindle, whofe teeth communicate it to the pettles or thampers, which are hereby raifed and made to fail alternately according as its teeti catch on or quit a kind of latch in the middle of each peitle. The pettles and troughs are of wood; each trough having at leark tivo, fometimes three peilles, at the difcretion of the matter, or accurding to the force of the flream of water. In thefe troughs are laid the cloths, ituffs, \& c . intended to be fulled: then, letting the current of water fall on the wheel, the peflics are fucceefively let full thereon, and by their weight and velocity ltamp and prets the fuffs very llrongly, which by this means become thickened and condenled. In the courfe of the operation, they fometimes make ufe of urine fometimes of fuller's earth, and fometimes of foap. To prepare the fluffs to receive the firlt imprefions of the peitle, they are ufually laid in urine; then in fuller's earth and water; and, lattly, in foap diffolved in hot water. Soap alone would do very well; but this is expentive : though fuller's earth, in the way of our drefing, is fearce inferior thereto; but then it mult be well cleared of all ftones and grittinefles, which are apt: to make holes in the thuff. As to urine, it is certainly prejudicial, and ought to be entirely difearded; not fo much on account of its ill fmell, as of its tharpnefs, and faltnefs, which qualities are apt to render the ittuifs diry and harth.

The true method of fulling with foap is delivered by Monf. Colinet, in an authentic memoir on that lubject, fupported by experiments made by order of the marquis de Louvois, then fuperhtendant of the arts and manufactories of France; the fubftance of which we fhall here fubjoin.

Method of Frizing Cloths and Woollen Stuffs with Soap.-A coloured cloth, of about 45 ells, is to be laid in the ufual manner in the trough of a fulling-mill; without firlt foaking it in water, as is commonly practi ed in many places. To full this trough of cloth, 15 pounds of foap are required ; one half of which is to be melted in two pails of river or fipring water, made as hot as the hand can well bear it. This folution is to be poured by little and little upon the cloth, in proportion as it is laill in the trough : and thus it is to be fulled for at lealt two hours; after which it is to be taken out and ftretched. This done, the cloth is imme. diately returned into the fame trough, without any new foap, and there fulled two hours more. Then taking it out, they wring it well, to exprefs all the greafe and filth. After the fecond fulling, the remainder of the foap is diffolved as in the former, and caft four different times on the cloth; remembering to take out the cloth every two hours, to ftretch it, and undo the plaits and wriskles it has acquired in the trou h.

Fulns Whan they perceive it fufficiently fulled, and brought to the quality and thicknefs required, they fcour it for

7nnambulus. good in hot weather, keeping it in the trough till it be quite cleen. As to white cloths; in regard thefe full more eafy and in lefs time than coloured ones, a third part of the foap may be fpared.

Fulling of Stockings, Caps, \&ic. Thould be performed fomewhat differently; viz. either with the feet or the hands; or a kind of rack, or wooden machine, eitho: armed with teeth of the fame matter, or elfe horfes or bullocks teeth. The ingredients made ufe of herein are, urine, green foap, white foap, and fuller's earth. But the urine alfo is reckoned prejudicial here. Woven ftockings, \&c. fhould be fulled with foap alone: for thofe that are knit, earth may be ufed with the foap. Indeed it is frequent to full thefe kinds of works with the mill, after the ufinal manner of cloth, \&c. But that is too coarfe and violent a manner, and apt to damage the work unlefs it be very ftrong.

FUlMAR, in Ornithology. See Procellaria, Ornithology Index.

Fulmar, or Foumart. See Mustela, Mammalia Index.

FULMINATING, fomething that thunders or refembles thunder.

Fulminating Gold, Silver, Copper, Quickfliver, \&c. See Chemisery Index.

FULMINATION, in Chemifiry, the fame with detonation.

Fulmination, in the Romilh canon law, a fentence of a bilhop, othicial, or other ecclefiaftic appointed by the pope, by which it is decreed that fome bull fent from the pope flall be executed.

FUMARIA, fumrtory, a genus of plants belonging to the diadelphia clafs, and in the natural method ranking under the 2. th $^{\text {th }}$ order, Corydales. See Botany Index.

FUMIGATION, in Chemiffry, a kind of calcination, when metals or other hard bodies are corroded or foftened by receiving certain fumes for that purpofe.

Fumigation, in Medicine. By the fubtile fumes that are infpired as well as inhaled into our bodies, much benefit or prejudice is produced, according to the nature of the matter, and the conflitution into which it is received; as is evident from the palfies produced among workers in lead-mines, \&c. and the benefits received in many cales when the air is impregnated with falutary materials. Catarrbs and catarrhous coughs are relicved by fumes received with the breath; and, by the fame method, expectoration is affifted in humoural atthmas; and even ulcers in the lungs are faid to have been healed by this method. The advantage of mercurial fumigations in the cure of venereal ulcers is known to every practitioner.

FLiITTORY. See Fumaria, Botany Index.
FUNAMBULUS, among the Romans, was what we call a rope-dancer, and the Grecksfchonotates. See Rope-Dancer.

There was a funambulus, it fecms, who performed at the time when the Hecyra of Terence was acted; and the poct complains, that the fpectacle prevented the people from attending to his comedy. Ita populus fludio flupidus in funambalo, animum occuparat.

At Rome, the funambuli firit appeared under the
confulate of Sulpicius Prticus and Licinius Stolo, who were the firit introducers of the ficenic reprefentations. It is added, that they were firt exhibited in the illand of the Tyber, and that the cenfors Meffala and Caffius afterwards promoted them to the theatre.

In the Floralia, or ludi Florales, held under Galba, there were funambulatory elephants, as we are informed by Suetonius. Nero alfo fhowed the like, in honour of his mother Agrippina. Vopifcus relates the fame of the time of Carinus and Numerianus.

FUNCHAL, the capital of Madeira, fituated round a bay, on a gentle afcent, and containing about 15,000 inhabitants. It is watered by feveral ftreams from the mountains; and is defended by a cafle on a fleep rock, which is furrounded by the fea at high water. The houfes are built of brick or free-flone; but the flreets are narrow, dark and dirty. W. Long, 17. 6. N. Lat. 32. $3^{8 .}$

FUNCTION, the act of fulfilling the duties of any employment.

Functiox, being alfo applied to the actions of the body, is by phyficians divided into vital, animal, and natural. The vital functions are thofe neceffary to life, and without which the individual cannot fubfift; as the motion of the heart, lungs, \&c. The natural func* tions are fuch as it cannot fubfift any confiderable time without ; as the digention of the aliment, and its converfion into blood. Under animal functions are included the fenfes of touching, talling, \&c. memory, judgment, and voluntary motion; without any or all of which an animal may live, but not very comfortably.

The animal functions perform the motion of the body by the action of the mufcles; and this action confifts chiefly in the fhortening the flefly fibres, which is called contraction, the principal agents of which are the atteries and nerves dillributed in the flefhy fibres.

All parts of the body have their own functions, or actions, peculiar to themfelves. Life confifls in the exercife of thefe functions, and health in the free and ready exercife of them.

Function, a term ufed in analytics for an algebraical expreflion any how compounded of a certain letter or quantity with other quantities or numbers ; and the expreffion is faid to be a function of that letter or quantity. Thus $a-4 x$, or $a x+3 x^{2}$, or $2 x-a \sqrt{a^{2}-x^{2}}$, or $x^{c}$, or $c^{x}$, is each of them a function of the quantity $x$.

FUND, in general, fignifies any fum of money appropriated for a particular purpofe. '1 hus, that part of the national revenue which is fet apart for the payment of the national debt, is called the finking fund. But, when we fpeak of the funds, we generally mean the large fums which have been lent to government, and conititute the national debt ; and for which the lenders, or their affignees, receive intereft from $r \in v e-$ nues allotted for that purpofe. The term flock is ufed in the fame fenfe, and is alfo applied to the fums which form the capital of the bank of England, the Eafl lndia and South Sea companies; the proprietors of which are entitled to a thare of the profits of the refpective companies.

Fund.

Fand. The practice of funding was introduced be the Venetians and Gencele in the 1 toth century, end has Leen adopted ance by moft of the nations in Europe: Princes had often bormowed money, in fummer times, to dupply their exigencie:, and functimes mortgaged their territerie in fecurity: Lut theic loas were generally estorted, and their prayment was always frecarious; for it depended on the gond faith and fuccels of the borrower, and never became a regular burien on foofierity. The origin of fund is derived from the pecu. liar manners and circumatances of modern Europe. Since the invention of genpowder, and the progrels of commerce, the military oceupation has become a dithet employment in the havds of mercenaties ; the apparatus of war is attended with more expence; and the decifion of mational ciuarelo has often been determined by conmand of moncy rather than by national bravery. Ambitious pinces have theretore horrowed money, in order to carry on their projects with more vigour. Weaker ftates have been compelled, in felfdetence, to apply to the fame relource; the wealth introduced by commerce has afforded the means; the th gularity of adminiliration, ellablihed in confeguence of the progrefs of civility, has increated the confiaence of indisiduals in the public fecurity; the comfhated fylfem of modern policy has estended the Fienes of war, and prolonged their duration; and the colonies eitablimed by mercantile nations have rendered them vulnerable in more points, and increafed the erpence of detending them.

When a greater furn has been reguirad for the an.alit expence than could eafily be dunplied by anmual taxcs, the government have propuled terms to their own fubjects, or forcigners, for obtaining an :wisance of money by mortgaging the revenue of future years for theit indemnification. Thi mortgave may either be for a limited period, or perpetual. It the fum allot2ed amually for the butefit of thole who advance the money, be confiderably greater than the interefis of the lums advanced, they may agree to accept of fuch atlowance, for a limited time, as a full equivalent. Thus, they may either agree for the calual produce of the revenue aligned; or a fised annuity for a greatir or lefs number of years; or a life ammity to themlelves or nominees; or all annuity for two or more lives; or an annuity, with the benefit of furvisomhip, called a tontine, in which fcheme, the whole fum to which the original anmitants were entitled continues to be diftributed among the furvivur,

The entablilment of the runds was introdaced in Britain at the Revolution ; and hav fince been gradually *nlarged, and carried to an amazing extent. The vasious methods above-mentioned have been wfed in their turn, but perpetial annuities have been granted for the greateft part; and, even when the monety wai originally advanced on cther conditions, the lenden have been lometimen induced, hy fiblequent offers, to accept of perpethal anotaties, initead of the former terms. The debt tor which perpetual annaties are granted, is ralied the racomable dibr, and the other is called the iry cdeenaine wit. Although the debts thus contracted by government are feldorm frid for a long term of years; yet any creditor of the rublic may obtain money for what is due him when he plealen, by transferring his property in the funds to another; and FoL. IX. Part I.

 Hooks become a hind of circulather of al : and hive the fame effict, in Some mfocte, Ah it iveralating money in the nation. Wl.on a thechlodde: thanats
 puice than the original vise, and at che" that , be ob liged to accept of 't letw ofe. The wite st the tom of depends on the propetinn tectucen the interelt thay bear, and the hemfit winh thay be orames by at flying the money to other purpoies. It 1s inthameal Dy the plenty or farcity of money, and hy the gunt tity of the public debt ; and it is impaisel 1, my ent which threatens the tiffety, or weakens the crecit. of the government.

The lumets of otock jobbing is founded on the va riation of the price of ftock. Pertons pofleffed of reat property may buy or fell fiock, according th theil no. tion that the value is likely to rifc or fill, in "ppena tion of making profit by the ditference of pree. And a pracisce has taken place among perfons who often poitefo no property in the funds, to contract for the laie of itock againft a future day, at a price now agrecd on. For intance: A agrees to fell B iosel. ot batk tlock, to be trancterred, in 20 days, for 1203 . A has, in fact, no fuch flock; bat, it the price of bank ftock, on tiee day appointed for the transfer, fhould be only 118 per cent. A may purchafe as much as will enable him to fultil his bargain for 1180 l . and thes gaini 22l. by the tranfaction; on the contrary, if the prics of bank tock be 125 per cent. he will lote sol. The bufineis is generally fettled without any actual purchale or transter of thock, by $A$ paying to $B$, or receiving from him, the difference between the current price of the fock on the day appointed and the price bargained for.

This practice, which is really nothing elfe than a wager concerning the price of fack, is contrary to latw : yet it is carried on to a great extent. In the language of Exchange Alley, where matters of this kind are tranfacted, the buyer is called a lutl, and the feller a biar. As neither party can be compelled by law to implement thele bargains, their tenfe of honour, and the difgrace and lofs of future credit, which attend a breach of contract, are the principles by which the bunnefs is fupported. When a perfon $d$-clines to pty his lofs, he is called a lame duck, and dare nover afterwards appear in the Alley. This opprobrious appellation, however, is not beltowed on thole whole falure is owing to want of ability, providing they make the fame furrender of their property voluntarily, which the law would have exacted if the debt lad heen entitled to its fanction.

The interell or dividend on the fock is paid haliyearly; and the purchafer has the bencait of the inte rell due on the thiak he buys, from the lat term the the time of purchafe. Therefore the prices of the Huckrie gradually, cieveris paribut, from term to term, and tall at the term when the interelt is paid. In comparing the prices of the different flock, it is necelfiry t, advert to the term when the lat interen was paid and, allowance being made for this circumtlance, the prices of all the government troch, which bear interell at the fame rate, muit be nearly the fame, as they all depend on the fame fecurity.

if if is la. in mopofed, fuch te:ms mull be oher-- - , -m af to de kulens, an may render the trantaction benefa. 1. an d thi is now regulated by the prices of the Whtucnc. It the facols, which ber intereft at a per tatt. 1 :1 in $[$ rer, or rather above, the government may exrect to borro. money at that mae; but, if thete ttcicis are under !e, the qovernment mut either grant a higher internt or fome otter advantage to the lenders, in compration for the dilierence. For this yurpole, bedides the perpetual ananity, another as:muity t.a donecime seen grarul for liee, or for a term of yar. Latarits have frofuent'y hetr employed to Faclitate the 3 , $2 n$, by entithing the fubferibers to a certrin lumber of tiskit, for which no higher price is chages thon the es. net value dimibuied in prizes, thoush the: marke: price is s.nerahy 21. or 31. bigher. Sometimes on a cetment of a certaia rropotion of the capitat bos been cranted, and a lender entitled to locld ISth. ff rk, though in reality he advanced no mote puthap than os?.

It belongs to the chancelion of the exchequer to poncit the tems of the loan in parlmment: and he fencmaly makes a previous s.rreement with fome wealthe merchants, who ree villing to advance the money ca the turms propoed. The fubferibers to the loan - iofit a certaia part of the fum fubleribed; and are bound to pay the reft by inflaments, or fated proportions, on appointed days, under pain of forfeiting what the: bave depofited. For this they are entitled, perhad, not only to lirlit their thare in the capital, but to ...) wruity for 10 surs, and to the right of receiving a certain number of lottery tichets on advantageous terms. They may fell their capital to one perion, their ammity to a fecond, and their right to the tickets to a thind. The value of all thefe interefts together is callrd cmin.um; and, in order to obtain a ready fubteription, it ousht to amount to 1021 . or upwede, on $1=0$ l. of copital. This diffetence is called the lonus to the labferibers.

The capitul advanced to the pablic, in the form of transicrable ilocks, and bearing interell from taxes apwopriated for that purpote, is called the finded dets. Renden, there is generally a comiderable fum due by So:cmment, which is not difpofed of in that manaer, ..id therefore is dill:mguifued ly the appellation of the ationded dibe. Thes may rife from any fort of national "yenec, fur which no prusifion hes leen made, or for which the provition has proved infutlicient. 'The chicf brinches are,

1il, Exchoquar B /hs. Thefe are iffued from the exbepuer, genetally by appointment of parliment, and fonctimes sithout farh appontment, when esigencies iequire. They bar interef from the time when ifited, :nd are t.iken in b: the Bank of Longland, which promotes the ir circulation.

2d, Na:y Bills. The fums anmually granted for the save have alway f.. 1 len thort of what that fervice :cquifed. To fupply that deficiency, the admiralty iffues bills in praymert of victuals, thores, and the lii e, which buar interef fix months after the time ifluad. The debt of the nav; thus contracted is ditharged, frus time to time, by paliament.

In time of war, the public expenres, fance the Revoiutiu, have alway been much greater than the annual revaide ; and latge fom lave conequently been bor-
rowed. In time of peace, the revenue exaccest the expence, ard part of the public debt has frequently been pait off. But, though there have been more years of peace than of war firce the funds were citablithed, the debts cas trated dusiny each war have much excecded the payments duting the fubfequent peace. This will a proar by the ftllowing abliract of the progrets of the national cett.

FLNDASIENT, in Anatomy, the lowelt part of the inteltinum reetum, called by anatomits the arow see An $\pm$ Tovy.

FLNDAMENTAL, in general, fomething that ficies as a bate or found tion for another.

Pospamentile, in Mu/id. A fondemental found is that which forms the lowelt note of the Chord, and from whence are deduced the harmonical relations of -See Tori. $\cdot$ the reft; or. which ferves for a sey to the tone + . Tlee furuitamental bajs is that which ferves for a foundation to the harmony. A fundamental chord is that whofe bafs is fundamental, and in which the founds are ranged in the fame order as when they are qenerated, according to the experiment fo often refented by M. d'Alembert, in his Preliminary Ditcourfe and Elements See Msfia of Mufic $f_{0}$. But as this order removes the parts to an estreme difance one from the other, they mult be approximated by combinations or inserfons; but if the bafs remains the fame, the chord does not for this reafon ceafe to bear the name of fundamental. Such an example is this chord, ut mi fol, included in the interval of a tifth: wheeeas, in the order of its generation, 2. $\mathrm{fo} / \mathrm{m}$; it includes a tenth, and even a fevententh; tice the fundamental $u$ : is not the fith of fol, but the W?ave of that fith.

Tesidnestail Bg/s. This part in mulic is, according to Rowfie $: 2$, and in lced according to all authors who have proceeded upon M. Rameau's experiment, in its primary ilea, that bals which i, formed by the -andamental notec of every perfect chord that conlti+ites the hamony of the piece; fo that under each hurd it caufe, to be beard, or unde:ffoud, the fundamenta? found of that varticular chord; that is to dat, the found from whence it is derived by the rules of hamony. From whence we may fee, that the fundamental bafs can have no other contexture than that of a regular and findamental fucceflim, without which the procedure of the upper parts would be illegitimase.

To underfand this well, it is necenary to be known, thet, according to the fyitem of Ramesu, which RouiSeau has followed in his Dietionary, every chord, thungh - ompofed of feveral founds, can oni lave one which is its fundamental, viz. that which produces this chord, and which is its bafe according to the direct and natethl order. Now, the bats which prevals under all the otiser parts, does not always expref the fandamental touth of the chords; for amongll ail the founds which fiom a chord, the compofer is at libert: tu transfer to the bafs that which be thinks preferable; regard being lad • , the procedure of that bats, to the boanty of the melody, and above all to the exprefion, as may offerward! be explamed. In this cafe the real fundarmenta! iound, shatad of retaining its natural fation, whith is Ot the bur, will either lee transfard is lome of the

 which it was prodaced: but a thetre iond fosen cialuer ent combiation:, thefe curyhations hac bow ber taken for fandamemol chords: defero homev f.in been given them, (xhich may be feen at it a wod It cord, in Roulteat Dictionary. Their mames, bo t Ferfons who betmwed them, were liswhi w era........ factify their difinction ; in if a difirsene: in :....... could really produce a difference in the fpecies.
M. Rameau in his Treatile of IImmone has fio. and M. d'Alembert in his Ekments of \atir Wan , it more clearly erinced, that many of ti.efe pretenacil. cifferent chords were no more th m inceriuns of w... fingle chord. Thus the chord of the fisth is no more than the perfect chood of the thied tar fored to at: bat; by addion a fith, we hall bave tho chorl e th. fixth and fouth. Here there are thite con' ii..tt: of a chord, which only consits of three lounds: thote whic! contain four founds are fefeptine of fuct combinations, fince each of the fo fourd may be :omes ferred to the batc. But in addins, benestin an amothe. bafs which, under all the combinations of ato sin! th. fame chord, al:ways prefents the fundanemal tound; is is evident, that conionant chords are reduced to : $\hat{6}$ number three, and the number of difiomant chooc. $t$ : four. Add to thin all the chords by fuppofition, whicit may likewie be reduced to the fane fundameatais, asid you will find harmony brought to a desree of limulicity in which no perfon could ever hope t, lee it whit is rules remained in that fate of confonion where N1. R..meau found them. It is certainly, as that author ubferves, an an mithing occurrence, $\mathrm{t}^{\text {tian }}$, pradice $\mathrm{t}^{\prime}$ is art cound be carried fo far as it really was, witwurt knowins it foundntio. ; and that all the rule: were io esaclly found, without having diforered ti.e princigle on which they depended.

After having thown what is the fand mental bafs be neath the rhorde, let a now fesh of its 1 meedure, and of the mamer in which it conneds thefe chord amons thenfelves. $U$ 'on thi point the prea $i$ ts of the ast may lee reduced to the lix following rules.

1. The fundmental baf, ouzhe never to Cound any other notes than thule of the feries or tome in which the compofer find himflt, or at leat thofe of the feries or tone to which he chorfe to make a tranfitions. This of all the rule for the fundamenel bars a ? .ee litit and molt indipenialle.
2. By the feeond, its procedare eught to be fo implicitly fubje? to the laws of modulation, as bever ts fuafer the idea of a former mote to be lo.t till that of a tubfe fuct one can be le ivinutely allumed; that is to fay, that the lundamental bafs onght never to? be deviob:, or fuffer in to be one moment it a huti in what noode we are.
3. ry the third, it is fubiceted to the rommeina ri cho:ds and the prearation of didonances : a mann wre which, as we thail afternard ice, is nuthing elie lat a muthod of producing this comesion, and which of comberance $i$, only neculary when the come ion cannot fubsid withont it. Sie Cossavios, PR!fal: riox.
 Kト: ठna?
rundamev-lonance, to purfue that career which the refolution of $t a l$. the diffonance indifpenfably prefribes. See ResoluT10N.
4. By the fifth, which is nothing eife but a confequence of the former, the fundamental bafs oudht only to move by confonant intervals; except alone in the operation of a broken cadence, or after a chord of the feventh diminithed, where it rifes diatonically. Exery other motion of the fundamental bals is illegitimate.
5. By the fisth, in hort, the fundamental bafs or harmony ought not to be fyncopated ; but to dillingumh the bars and the times which they contain, by changes of chores properly marked with cadences; in fuch a manner, for influme, that the diffonances which ought to be prepared may find their preparation in the imferice t time, lut chienly that all the repofes may hapfon in the perfect time. This fixth rue admits of an infinite number of evceptions; but the compofer ought hovever to be attentive to it, if he would form a mutic in which the movements are properly marked, and in which the bars may end gracetully.

Wherever the fe rules are ublerved, the harmony hall te regular and without fault: this, however, will not hinder the mufic from being deteltabie. See ConfostTION.

A word of illutration on the fifth rule may not be welefs. Whatever turn may be given to a fundamental bafs, if it is properly formed, one of thefe alternatives muft always be found ; either perfect chords moving by a nfonant intervals, without which theie chords wond have no connexion; or diflonant chords in operations of cadence: in every other caie, the dirlonance ean neither be properly 1 laced nor properly refolvad.

Fiom thewe it follows, that the fundemental bafs amot move regulanly but in one of thefe three manakers : 1tt, To rife or defeend by a third or by a fixth. ally, By a fourth or a bith. 3dly, Co rife dintonicully by neans of the difonance which form the connexion, of tiy a licence upou a perfect chord. With refpect -o a diatonic defcent, it is a motion ablifutely prohilitad to the fundamental baf; or, at molf, merely tolerated in cafes where two perfect chords are in fuccefion, itiviced by a clofe exprefied or underitood. This rule has no other exception : and it is from not difeening - He foumation of certain tranlitions, that M Rameau the caffod the fumbamental bof to defeend diatonic:lly incer choris of the feventl.; an operateon which is impracticable in legitimate hermory. See Cadence, Drsosisior.

The fundanevtal bifs, which they add for no other mafors than to ferve as a proof of the harmony, malt be retron had in exccation, and often in practice it would have a vely bad effeet; for it $i$, as M. Kamean very $\frac{t}{}$ operiy olferw, intended for the judgrment, and $n$ if for the ear. It would at leat produee a monotony extenerly naufoou by frecfuent returns of the fime chord, which the difgure and vary more agtceably
 fare, wiot me reckoniw upon the diterent inverifons of harsony, which fumibs a thoutand means of adding re\% lieasie to the manic and "en ener: so the expoch-

not ufeful in compofing good mufic, if it muft even be Fundamen. retrenched in practice, what good purpofe, then, can it ferve? We anfwer, that in the firft place, It ferves for a rule to fcholars, upon which they may lcam to form a regular harmony, and to give to all the parts luch a diatonic and elementary procedure as is preferibed them by that fundamental bafs. It does more, as we have already faid: it proves whether a harmony already formed be juft and regular ; for all harmony which cannot be fubjected to the teft of a fundamenta? bafs, mult according to all rules be bad. Finally, it ferves for the inveftigation of a continued bals under a given air : though, in reality, he who cannot directly form a continued bafs will farcely be able to form a fundamental bafs, which is better; and much lefs ftill will he be able to transform that fundamental bafs into a legitimate continued bafs. Thele which follow are, honever, the principal rules which MI. Rameau prelcribes for finding the fundamental bafs of a giver. air.

1. To afcertain with precifion the mode in which the compofer begins, and thofe through which he palies. There are allo rules for inveltigating the moder; but fo long, fo vague, fo incomplete, that with retpect to this, the ear may be formed long before the rules are acquired; and the dunce who fhould try to ufe them would gain no improvement but the habit of proceeding always note by note, without even knowing where be is.
2. Tutry in fucceffion under each note the principal chords of the mode, beginning by thofe which are moit analogous, and pating even to the moft remote, when the compofer fees himfelf under a necelity of doing fo.
3. To confider whether the chord chofen can fuit the upper part in what precedes and in what follows, by a juit fundamental fuccefion; and when this is impracticable, to return the way he came.
4. Not to change the note of the fundamental bal. till after having exhauled all the notes which are allowed in fuccetlion in the upper part, and which can enter into its chord; or till fome fyncopated note in the ait may be fufceptible of two or a greater number of note, in the bats, to prepare the dinonance which may be atlerward, retolved according to rule.
5. To thudy the intertexture of the phrafes: the pofible fucceffion of cadences, whether fill or avoided; and above all, the paufes which for ordinary return at the end of every four, or of every tho bars, fo that they may always fall upon perfect aird regular ca. dences.
6. In fhort, to obferve all the rules formerly given for the compontion of the fundamental bati- - Thefe are the pincipal obfervations to be made for finding one under any given air : for there are innetimes feveral ditlerent ones which may be inveltigated. But, whatever may lic laid to the contrary, if the air has accent and character, there is only one jult fundamental bals which can be adapted to it.

After having given a limmary explication of the manner in which a fundamental bafs iloould be comFofed, it fhould remain to fuggeil the means of tranfforming it into a cuntinaed bals; a... this would be caf, if it were only neculiny to regard the diatonic promedure and the agrecable ar of this bafs. But let

Fwat us not imagine that the bath, which is the guide :mad 11 fupport of the harmony, the finl, and as it were the iaterpreter, of the air, thould be limited th rula to fimple: there are othens which dipen! upon primitien more certain and more radical; frititul, tut latent frinciples, which have been felt by every attit of 40 ,hus, without having been detected by any unc. Rumfout hopes, that in his letter upon French mufic he inlinuated this principle. Por thofe who underit nd hi:n, he imagines he hav faid enough concerning is, and can never fay caough of it for thofe who du not. See Rouffeais Ml/fellanic, wol. ii. p. 1.

He does not here nacritiun the ingenious fyiter by M. Serre of Geneva, nor his double fundamental bali ; becaufe the principles which, with a dagacity meritorious of praile, he had half detested, have afterwards been unfolded by M. Tartini, in a work of which Rouffeau has given an account in his article Sissith.

FUNDI, in Ancient Geogrephy, a town of Latium, on the Via Appia, near Cajeta; enjoying all the privileges of Roman citizens, except the right of fuifrage and of magitracy. Now Fendi; a city of Naples, on the confines of the pope's dominions. E. Long. if. 22 . N. Lat. $4^{1 / 35}$

FUNDY, a bay of confiderable extent in North America, opening between the illands of Penoblicot bay, in the county of Lincoln, and Cape Sable, the fuuth-well point of Nova Scotia. It reaches about 200 miles in a north-ealt diretion, and forms a very narrow ithmus with Verte bay, which reaches into the land in a fouth-welt direction from the itraits of Northumberland. It is 12 leagues trom St John's in New Brunfwick, to the Gut of Annapolis in Nova Scotis, where the tides are remarkably rapid, and rife to the height of 30 feet. The tides in this bay are to rapid, that it is laid, they will overtake animals feeding on the hlore.

FUNEN, or Fiova, a conficerable illand in Denon ark, feated on the Baltic fea, and feparated from Jut1 nid by a ftrait called the $L_{e} / /_{c}$ r $B_{c} l$, and from the inend of Zealand by another called the (rient Beti. It $\therefore$ tertile in wheat and barley; and abounds in cattle, hories, game of all forts, and filh. Odenfee is, the capita! town.

FUNERAL RITES, ceremonies accompanying the biverment or burial of any perfon. The word is formed of the Latin funur; and that of fonalia, on account of the torches (which were fianes cer a circumdati) ufed is the funeats of the Romans; thometh others derive Situr from the Greek quore, de ath or wilus-here.

Thele riten differed amont the ancients according to the diffeent genius and religion of each country.

The ifft people who feem to have paid any particular refpect to their dead, were the Egyptian, the pusierity of Hum, the firl cultivators of idolatrous worthip and fuzerilition after the dood; they were alfo the fili who afierted the immortality of the foul, its migration into all kinds of animals in earth, air, as. sa, and its return to the huran boly; which they "upofed to be within the term of 3202 years: Hence proceeded their very great cate in embriming of their aead bodies, and their being at lich vatt expenct, as they were, in building proper repolionie, for them; for they were more folicitous about their grases than

world, the pyramed, i.ch wole built for the bariol of F.tal. their hits:, whth tweh o:t cl....., m! ahmoll ines.....

Auma the ancient Grater it was wiul fometmes erioe ile interment, to pat a piece of money into the aucoth of the deceafed, which was thought to be Chaans tare for wating the denarted ful orev the inferal aiver. This ceremny was not ufed in thote comurics which were fuppofed to be fitured in the neinhAnond of the internal regiors, and to lead rimitr hy aready and direct road. The corpe vas likevite Bamined with a cake, compofed of flow, honey, 太c. whith was defigned to appeafe the fury of Cerberus the door-keeper of hell, and to procure the gholl a Thfo and quiet contrance. Daring the time the coppe -atinued in the houfe, there liod befure the door a weflel of water: the defign of which was, thit thofe ancerned about the body might purify themfeles by athing ; it being the opinion of the Greeks, as wall - of the Jews, that pollution was contracted by touching a dead body.

The ceremonics by which they exprefled their for--ow for the death of their friends were various; but $\because$ Ieems to have been a conitant rule to recede as much as politiole in habit and behaviour from their ordinary cultoms. For this reafos they abllamed from banquets and entertamments; they divefted themfelves of all ornaments; they tore, cut oft, or thaved their hair, which they cat into the funeral pile, to be confumed with the body of their deceafed friend. Sometimes they Shrew themelves on the ground and rolld in the dult, or covered their head with ahes; they beat their brealls, and even tore their theh with their nails, upon the lofs of a perion they much lamented. When perons of rank, fuch as public magitates or great generals died, the whole eity put on a face of moumiats ; all public mectings were internitted ; the fchouls, baths, thop", temples, and all places of concourle, were hlut up.
liftr interment followed the epulif or fealts, at which the company ufed to appear crowned; when they fpuke in ;rafe of the dead, bo far as they could go wilh trath, it being eitemed a notorious wichedne's to lic upon fueb an occafion. And not only at thofe fealt, but even before the company departed from the lepulchre, they were fometimes entertained with a panegyrie upon the dead perton.

The Grecian foldiers, who died is war, had not unly their tombs adorned with inferptions thowing their names, paiertage, and exploit, bat werc alfo honcured with an oiation in their praife. Particularly the cuftom among the Athenians in the interaent of their foldiers was as follows, namely, "They uful to place the bodies of their dod in tents three days before the funcral, that all perfor might lase oppertenity se find out thesir relations, and fay thir hat reepent
to them. l'par die forth day, a coma of cyprefs Funer: Wis sent from every tribe, to convey the bones of their own rel.tions; after which wert a covered herfe, in mernory of thote whofe bodies could not be fu:nd. . 111 theic, accompanied with the whole body of the peopie, were carned to the pablic burymg place, called Ceramicers, and thate intercel. Ore oration was fpoken in commench ite. of them all, and their monmentswere adomed with atlas, inferiptions, and all other or aments oftal aoon the tom'so of the molf lionourable pettons. The oration wis pronounced by the tathers of the deceated periuns who had wehaved themilves moft whantly. Thes aiter the famous battle at Marathon, the fathers of Collimachas and Cynegyrus were appointed to male the flamal oration. And wonn the return ef the day, upon which the folemnity was fiff held, the fame oration was conftantly repeated every year."

Intering or laying the dead in the ground feem. to have been the moot aucient pracice anong the Grechs; though burning came afterwards to be genear.lly uted among them. It was ctiftomary to throw iato the funerai pile thofe garments the decealed ulanlly wore. The pile was lighted by one of the decealed's nearelt relations or friends, who made prayers and vows to the winds to afint the flames, that the boty might quickly be reduced to afhes; and during the time the pile was burning, the dead perion's friends itood by it, pouring libations of wine, and caling upon the deceared.

The funera' rites among the anci, nt Romans were very numerous. The deceafed was kept feven days; and every day wahed with hot water, and fometimes with oil, that, in cafe he were only in a flumber, he might be thus waked; and every now and then his fiends meeting, made a horrible outcry or thout, with the fame view; which lait action they called concimati. The third conclamation was on the feventh day; when, if no figns of life appeared, the defunct was diefled and embalmed by the pollinctores; placed in a bed near the door, with his face and heels towards the freet : and the outfide of the gate, if the deceafed were of condition, was garnimed with cyprels boughs. In the courle of theie feven days, an altar was raited near his bed ide, called acerra; on which his friends every day offered incenfe: and the libitinarii provided things for the funcral.

On the feventh day a crier was fent about the city, to invite the people to the fulempization of the funcral in thefe words: Exequias L. Cit, fliii, quil'us $\epsilon /$ ? comnodum ire, fan tompus e/f. Silus i. c. ille ex edieus eff rur. The people being affembled, the laft conclamation ended, and the bed was covered with purple a trumpeter marched forth, followed by old women cathei or fice, finging fongs in praite of the deceafed: lafly, the bed fulowed, burae by the nest relatime; and it the perfon were of cquality and ofice, the waven inages of all his predeceffios were carrisd wefre him on poles. The bed was followed by his chiidren, kindred, \& Co, atrati, or in moaning: from which act of following the corpfe, thefe funeral rite- were called crequic. The body thus bromght to the rotra, the nest of kin

Finer.az Oration, a dilonure pronourced in praif a. a perton decerited, a the ceramony of his funcral.

This caton is very ancient. Ia the latter part .. the account abowe given of the Esyprian ceremonic: of intormont, may ne perceived the frolt rudiments funcal oratims, and what wav the lubjest of then, Which were atcmards mon!ded imo a mose pnlite and regular torn by other actions, who adopted thi cathon. Nur can we omit remaking, that thode funcral fulemnities were attexded not only with orations in praife of the deceated, but with prayers for him; which prap it feems, vere made by one who perforated the du. ceated: an entire form of one of them is preferved by Porpbyry, and perhaps it may in fome meature ratity the reader's curiofity to recite it from him. "W When (hays he) they (the Egyptians) embrlm their decested nobles, they privately take out the entrails, and ly them up in an ark or chelt: moreover, among cthe: things which they do in favour of the decer ed, liftings up the ark or cheft to the fun, they inwoke him; one of the Jhitinari' making a prayer for the tecealed, wi: h Euphantus has trandited out of tl e Egyptian la:gueqe, and is as follows :- $O$ lord, the fan, and all the gods vilo Give life to men, receive me and admit me int, the fociety of the immortal oncs; for, as long as 1 lived in this worid, I religionly worthipred the gend. whom my parent, thowed me, and have alway ho. rowned thofe who begat my body; nor have I killow say man, nor have I defratided any of what has bea: committed to ny truft, nor have I done arythins which is inexpiable. Indeed, whint I was alive, is I have finned either by eating or drimhing anthing which was not liwfu!; not through melifi hawe I finned, but throag the fe, fhowing the ark and clen" where the cetraik werc. And having thus foke, in cafts it into the river, but the selt of the loady he c:buims as pure."

The Grecians received the feeds of fupentitic :tn.i idelatron worfip frem the Efrytime, throush the coming of Cecrop, (admus, Janaw, and Lroclathetsinto Crecec; and inbourt when curbms tronplanted fon Eng the dead, (): then, an enconsian on the deceaid alway formed a pate, a paricularly noticed under tha priccding articic.

From the lgyptims and Grecins, ctpecially from the latter, the Romans seccised many of their lams a. 1 colloms, as well as much of theis polytheitm and identrous werllij. oratory, ated the roi.. the text ot the hin lamiato defon:\%.n tro rof fra, that is, made a funeral oration, in the commendation principolly of the past deceatec, lat turaing the worthy acts atio of thote is pecechors whate images were the prefent. The account give: ly Dr Kennet is in thefe words: " In ail the duterd, of note, efpecially in the public or indietive, Ite whe was frit brought with a vat tan of follow-c:- into the forum; here oue of the neareft reations alacaled the rostra, and obliged the audience with an cation in praite of the decerfed. If none of the kindred undertook the office, it was dicharged by fome of the mort eninent ferfons in the city for learning and eloquence, as $A_{1}$ pian reports of the runeral of Gylla. And Pliny the jounger reckons it as the laif addition to the happinefs of a very great man, that he had the honour to be prailed at his funeral by the moit eluquent Tacitus, then conful: which is agreeable to Quintilian's account of this matter, Nam et funebres, Eic. For the funeral orations (fays he) depend very often on come public office, and by order of fenate are many times given in charge to the magiftrates to be performed by themfelves in perton. The invention of this cultom is generally attributed to Valerius PopRecul, foon after the expulion of the regal family. Plutare h tells us, that honouting his colleague's obfecuies with a funeral oration, it to pleafed the Ronsans, that it became cuitomary for the belt men to celebrate the funcrals of great perfons with fpeeches in their commendations" Thus Julius Cæfar, according to culom, made an oration in the roltra, in praife of his wife Cornelia, and his aunt Julia, when dead; wherein he thowed, that his aunt's defcent, by her mother's fide, was from kings, and by her father's, from the gods. Plutarch lays, that " he approved of the law of the Romans, which ordered fuitable praifes to be given to women as well as to men after death."Though by what he fays in another place, it feems that the old Roman law was, that funeral orations Ahould be made only for the elder women; and therefore he fays, that Ciefar was the firit that made one upo: his own wife, it not being then ufual $\therefore$ take notice of younger women in that way : but by that action he gained much favour from the popuiace, who afterwais looked upon him, and loved him as a very mild and good man. The reafon why fuch a law was made ia favour of the women, Livy tells us Yas this, That when there was fuch a fearcity of money in the public treafury, that the funt agreed upon to cise tive Gauls to brcit up the fiege of the city and atpitol could tiot be railed, the women collected anioney themiclus and made it up ; who hercupon had not only tharks given them, but this additional hoauour, that after death, they hould be foiemnly praifed os well as the men: which looks as if, before this time, waly the men had thofe funeral orations made tur them.

This cultom of the Romans very eariy obtained athor , the Clarilliars. Some of their funeral fermons on oracire are now extant, as that of Eufebius on Cosflatinc; ard thofe of Nazianzen on Bafil and Ciefariu; ; and of Imbrofe on Valentinian, Theodofms, and others. Gregory, the brother of Bafil, made - Tienoiner 2.0 erer, at fugeral oration, for Melitus bihiop of Autioch in bich orations, they not only praifed the
dead, lut adiefted thenfelves to them, which Ceems Fure:al, in twie introduced the cultom of praying to depated Fungi. haim. . Now the fe orations were ufually made before $\longrightarrow$ the boutc of tice deceaied were committed to the growed: which cufom has been more or leis continued ever lioce, to thi dey.

IVas it appeare, that thofe rites and ceremonics mong the l.eathens, which have been delivercd from one feugle to anozler, are what have given birth to

Fungril Scmons and Cratiure, among Chrifians. Though this practice is confiderably improved, and cleared of many things which would fmell too rank of paganifm. and is thrown into a method which, perhape, may be of icme fervice to chiftianty ; ytt, notwithftanding this new drefs, its original may very eafly be difcerned. The method in which the characters of deceafed pertons are given in our funeral femmons, i, very much the fame with that obferved in thofe pagan orations; where firt an account is given of the parentage of the deceafed, then of his education; after that, we hear of his conduct in riper years : then his many virtues are reckoned up, with his generous, noble, and excellent performances.-Nor let the practice be condemned becaufe of its rile and original ; for why may not the cultoms of heathenc if juit and laudable in themfelves, and nowife pernicious to Chriftianity in their confequences, be followed by Chritians: Only, ince we are come into this practice, ther is one thing we hould take care to follow them in ; and that is, not to make thofe fermons or orations for every one; but for thofe only whofe characters are dittinguilhed, who have been eminently ufeful in the world, and in the church of Chrilt. The old heathens honoured thofe alone with this part of the funeral folemnity, who were men of probity and juftice, renowned for their wifdom and knowledge, or famous for warlike exploits: This, as Cicero * informs us, being part of the law for burials, ${ }^{-}$Dc Leg, which directs, that the prailes only of honourable per-1.2. fons ihall be mentioned in the oration. It would be much more agreeable, therefore, if our funeral difcourfes were not fo common, and if the characters given of the decealed were more jult; devoid of that fulfome fiattery with which they too often abound.

FUNGI (from eforyos, fungus), the name of the $4^{\text {th }}$ order of the $24^{\text {th }}$ clafs of vegetables, in the Linnæan 1 ytcm ; comprehending all thofe which are of the muflaroom kind, and which in Tournefort conititute the $2 \mathrm{~d}, 3 \mathrm{~d}, 4^{\text {th }}, 5$ th, 6th, $7^{\text {th }}$, and 8 th genera of the firft fection in the clafs xvii. This order in the Linnæan arrangement, contains 10 genera; and it conftitutes one of the natural order of plants in the Frag. menta Methodi Naturalis of Linnæus. See Botany Index.

But as the claffification of this order only has been given under the article Botsisy, we thall here detail fome of the fpeculations of naturalifts concerning their nature and mode of production.

The ancients called fungi children of the earth, meaning, no doubt, to indicate the obfcurity of their origin. The moderns have likewife been at a lofs in what rank to place them; fome referring them to the animal, fome to the vegetable, and others to the mineral, king* dom.

Meffrs Wilck and Münchaufen have not icrupled to sank thefe bodies in the number of asimal productions;

Fugi becaufe, when fragments of them or their leeds were macerated in water, thefe gentlemen perceived a quantity of animalcules difcharsed, which they fuppofed capable of being changed into the fame fubltance. It was the ancient opinion, that beef cot:ld produce bees; but it was referved for Melits Wrick and Munchaufen to fuppofe, that beev could produce beef. Wilck afferts, that fungi condit of innumerable cavities, each inhabited by a po!ype; and he docs not hefitate to afcribe the formation of them to their inhabitants, in the fame way as it has been faid that the coral, the !ichen, and the mucor, were formed. Hedwig has lately thown how ill founded this opinion is with refpect to the lichen; and M. Durande has demonftrated its falfity with regard to the corallines. "Indeed (fays M. Bonnet, talking of the animality of fungi) nothing but the rage for paradox could induce any one to publih tuch a fable ; and I regret that pofterity will be able to reproach our times with it. Obfervation and experiment hoould enable us to overcome the prejudices of modern philofophy ; now, that thole of the ancient have difappeared and are forgotten."

It cannot be denied that the mufhroom is one of the molt perihable of all plants, and it is therefore the moft favourable for the generation of infects. Confidering the quicknefs of it, grovth, it muit be furnifhed with the power of copious ablorption; the extremity of its veffels mult be more dilated than in other rlants. Its root feems, in many cafes, to be merely intended for its fupport: for fome fpecies grow upon fones or moveable fand, from whicl it is impolifible that they can draw much nourifment. We mu't therefore fuppofe, that it is chienly by the ftalk that they abforb. Thefe ftalks grow in a moilt and tainted air, in which float multitudes of eggs, fo fmall, that the very infects they produce are with dificulty feen liy the microfcope. Thefe eggs may be compared to tfe particles of the byffas, 100,000 of which, as M. Gleditich fays, are not equal to the fourth of a grain. May we not fuppole, that a quantity of fuch eggs are abforbed bv the veitcls of the fungus, that they remain there, without any change, till the plant begins to decay ' Befdes, the eggs may be only depolited on the luiface of the plant, or they may exitt in the water into which they are thrown for examination. Do not we fee that fuch eggs, difperfed through the air, are hatched in vinezar, in pate, む己. and wherever they find a convenient nidus for their developement? Can it be furprifing then, that the corrurtion of the mulhroom fiould make the water capable of difcloing certain beings that are really foreign to both ?

It is not more eafy to acquiefce in the opinions of thofe naturalifs who place the fungi in the mincral bingdom, becaufe they are found growing on porous ftones, thence called lapides fungarii; which, however, mult be covered with a little earth, and be watered with tepid wate:, in order to favour the growth. Such muflurooms are no more the produce of the ftone, than the lichen is of the rock to which it altheres, or the mofs of th.c tree on which it is fuund. We have only to obferve the growth of mullircoms, to be conwinced, that this happens by developewent, and not by addition or combination of parts as in minerals. The opinion of Buccone, who attributed them to an unctuous matter performing the function of 'ced, atid aerui-

Vot.. I.K. Purt I.
ring extenfon by appoftion of timilar parts; and that of Moriton, who conceised that they grew fontancoully out of the earth by a certain mixture of falt and ful. phar, joined with oils from the dung of quadrupeds; have now no longer any adherents. Fungi are produ. ced, they live, they grow, by developement; they are expofed to thote viciflitudes natural to the different periods of life which characterize living fubstances; they perith and die. They extract, by the extremity of their velels, the jaices with which they are nourifhed; they elaborate and alfimilate them to their own fubftance. They are, therefore, organized and living beings, and coniequently belong to the vegetable kinydom. But whether they are real plants, or only the production of plants, is tifll a matter in difpute with the ableit naturaliits.

Some ancient authors have pretended to difcover the feed of muhhrooms; but the opinion was never generally received. Petronius, when he is langhing at the ridiculons magnificence of his hero Trimalcio, relates, that he had written to the Indies for the feed of the morelle.

Thefe productions were generally attributed to the fupertluous humidity of rotten wood, or other putrid fubftances. The opinion took its rife from obferving that they grew moft copioully in rainy weather. Such was the opthion of Tragus, of Bauhin, and even of Columna, who, talking of the peziza, fays, that its fubflance was more folid and harder, becaufe it did not originate from rotten wood, but from the pirtuita of the earth. It is not furprifing, that, in times when the want of experiment and oblervation made people believe $t_{1}$ at infects could be generated by putrefaction, we hould find the opinion general, that fungi ower their origin to the putreicence of bodics, or to a vil cous humour analogous to putridity.

Malpighi could not fatisfy himfelf as to the exillence of leed which other botanilts had pretended to difcover. He only fays, that theie plants mult have them, or that they perpetuate themfelves and hoot by fragments. Micheli, among the moderns, appears to have employed himfelf molt fuccelsfuliy on this fubject. He imagined, that he not only faw the feeds, but even the ilamina, as well as the littie tranfparent bodies deftined $t$ :, favour the difiemination and the fecundation of the fe feeds. Before this author, Liter thought he perceived feeds in the Fungus pero/us craffus magnus of John Bauhin : the little round bodies that are found in the pezizie and helvellox, at that time, pafled for feeds; which did not appear at all probable to Martigli, confidering that the eye, when aflited with the very belf microfoopes, couid perceive nothing fimilar in much larger fungi. Indeed thefe bodies may be the capfules or covers of the feed, if they are not the feeds themfelves. However this may be, Marfigli, obfersing that fungi were often without roots or branches, and that they wanted flowers and leeds, the meam which nature employs for the production of perfect plante, thought himfelf warranted in doabting whethet thefe beinge could be ranhed in the number of vegetables.

The doubs of Niar gli prompted him to obferve the fomation of fungi. Their matrix he called Situr: he innuined they grew in places where they met with an unciuous matter, compoled of an oil mixed with nitrous falt, which, by fomentation, produced heat and moif.

L:
ture,

## F U へ $\quad[206$ E U N

nure, and imfnuated itfelf between the fibres of :rood; that is, he imagined them to be the produetion of a whcous and putrefent humour. Lancili, in the sanner, conidered fong $i$ as owing their exift ace to the putrefaction of vegetablec, and fuppofed them a difeafe in the nlant; but he imaninct, "that the flures of the tree ween necellaty to their production," as is the cale in the formation of salls; he ccmpared them to the warts and! other excrefences of the human body. He added, itat fuch fungous vegetable tumours mult neceniarily af fume various forms and figures, from the fluids which difterd the tubes and velels relaxed by putrefence, from the ductility of the fibres and their direction, and from the action of the air.

This opinion has been refuted by the celebrated narutalitt M. de Julien, in the Memoirs of the Academy of Sciences for the year 1728 . He maintains, that the tang have a grent analo $y$ with the lichen, which is atlowed to be a vegetable; thatt, like the lichen, they are divelled of talk, branches, and leaves; that, like it, they grow and are nourihed upon the trunks of trues, on pieces of rotten wood, and on all lorts of futrid vegetables; that they refemble the lichen too in the rapidity of their growth, and the facility with which many of them may be dried and reftored to their former ture, upon being immerled in water; and, latt!v, that there is a great fimilarity in the manner in which their feeds are produced. He affirms, that only the warts and excrefcences which grow on animal bodies, and the knots and other tumors that are to be Found on trees, can be compared with one another; for they are compofed equally of the folid and liquid fubflatice of the plant or animal on which they grow; whereas, the matter of the fungi is not only quite difincid from that of the plants on which they are found, lut often entirely fimilar to the fubfance of thofe that frring immediatcly from the earth.

The or anization, fays M. de Juffieu, which diftinguihes plants and other productions of nature, is vilible in the fungi; and the particular organization of each fuecies is conflant at all times and in all places; a circumallarice which could not happen if there were not an animal reproduction of fecits, and confequently a multiplication and propagation by feed. This is not, he fays, an imaginary fuppofition; for the feeds may be felt like nieal upon muflnooms with gills, efpecially when they begin to decay; they may le feen with a magnifying glas, in thofe that have gills with black nargins: and, latly, fays lie, botanills can have no doubi that fungi are a dilinct clafs of plants, becaufe, loy compaing the obfervations made in different counties with the figures and defcriptions of fuch as have teen engraven, the fame genera and the fame fecies d:e everywhere found.

Notmithifanding this refutation by M. de Juffeu, atenthe er naturalifi, M. de Necker, has lately maintained, in his work entitled Mycitologia, That the fungi ought 10. If excluded from the three kingdoms of nature, and be confdered as intermediate beings. He has obferved, like Marfgli, the matrix of the fungi: and has fubnituted the word carchte (initium faciens) inftead of fitus; imagining that the rudiment of the fungus cannot exif beyond that point in which the develofement of the filaments or fibious riots is perceived. He allows, that fungi are nourifbed and grow like vege-
tbles; but he thinks that they differ very much from them in refpect of their origin, fructure, nutrition,

Fungi. and rapidty of growth. He fays, that the various veffels which compote the organization of vegetables are not to be found in the fungi, and that they feem entirely compofed of cellular fubllance and bark; fo that this fimple organization is nothing more than an ag gregation of veffels endowed with a common nature, that luck up the moilture in the mamer of a fponge; with this diference, that the moilure is ahminated into a part of the fungu. Lattly, That the fructitication, the only effential part of a vegetable, and which ditinguifhes it from all other organized locies, being wanting, fungi cannot be confidered as plants. This he thinks confirmed by the contant olfervation of thofe people who gather the morelle and the mul:room, and who never find them in the lame foots where they had formerly grown. As the generation of fungi (lays M. Necker) is always performed when the parenchymatous or cellular fubtance has changed its nature, form, and function, we mulf conclude that it is the degeneration of that part which produces thefe bodies.

But if fungi were owing merely to the degeneration of plants, they would be ftill better entitled to coniti tute a new kingdom. They would then be a decompofition, not a new formation or new bodies. Befides, we cannot deny, that in thofe bodies which form the limit between the animal and vegetable kingdoms, the organization becomes fimple, as the organs deftined for nutition are multiplied : but, as the latt in the clafs of infects belongs to the sinimal kingdom, fungi ought, notwithitanding the fimplicity of their organization, fill to belong to the vegetable kingdom. The parenchymatous or cellular fubitance, which, as Mr Bomet fays, is univerfally extended, embraces the whole fibrous fytem, and becomes the principal inftrument of growth, muit naturally be more abundant in thele productions; and this accounts for the rapidity of their enlargement. Befides, growth, whether llow or rapid, never was employed to determine the prefence or abfence of the vegetable or animal character. The draba verna, which in a few weeks thoots, puts forth its leaves, its Howers, and fruit, is not lefs a plant than the palm. The infect that cxilts but for at day, is as much an animal as the elephant that lives for centuries. As to the feeds of the fungi, it is probable that nature mear to withdraw from our eyes the diffemination of thefe plants, by making the feeds almort imperceptible; and it is likewife probable that naturalifts have feen nothing but their capfules. Since, however, from the imperfection of our fenfes, we are unable to perceive thefe feeds, ought we to infer that they do not exift? Are we authorized to conc!ude this, becaufe we do net find mufhrooms where we lave found them a year before? Undoubtedly not; for the greater part of plants require a particular foil, and the fame mould that this year will folter a rare plant, will next year allow it to perifh. Neither are we at liberty to deny the exiftence of thefe feeds, becaule thofe bodies which have been called their feeds, and the fragments or cuttings of the plants themfelves, have not produced others of the fame fecies. Nature feems to have relerved for herfelf the care of difeminating certain plants: It is in vain, for intance, that the bota-

## $F \in \mathrm{R} \quad\left[2 \sigma_{i}\right] \quad \mathrm{F} \mathrm{U}$ R

Fungi nit fows the duit found in the capfules of the orchis,
which every one allows to be the leed. But, after all, what are thofe parts in the fund cafually obterved by
naturalifts, and which they have taken for the parts of fructification? Thefe are quite dillinet from the other parts; and whatever may be their ule, they cannot have been formed by a prolongation of the cellular fubitance, or of the fibres of the tree on which the fungus grows : they are, therefore, owing, like flower and fruit, to the proper organization of the plant. Thefe plants, thereforc, have a particular exitence, independent of their putrefying nidus. The gills of certain fungi, which differ eflentially from the reft of the plant in their conformation, would be fufficient to authorife this latter opinion. But can putrefaction create an organic fubitance?

Nature undoubtedly difeminates through the air, and over the furface of the earth, innumerable feeds of fungi, as well as eggs of infects. The plant and the animal are excladed, when the nidus or the temperature is favourable for their developement. No fortuitous concourfe, either of atoms or fluids, could produce bodies fo exquifitely and fo regularly organized. It is fufficient to throw one's eyes on the beautiful plates which Schæffer has publithed of them, and compare them, by the glals, with the warts and other excrefcences of animals, to be convinced that they have not the fame origin. The function of the cellular fubitance in vegetables mult be greatly fuperior to that in animals, if it could produce any thing but deformities.

The greater part of fungi exhibit a configuration much too regular, conitant, and uniform, to be the effect of chance or putrefaction. As this form is prelersed the fame in all places where fungi have been found, it follows, that they contain in themelves the principles of their reproduction. They refemble the milletoe, and other paraltic plants, which are perfectly distinct from the trees on which they grow. The fungi, thercfore, are o: ganized and living fubtances, or true plants. If the manner of their production is unknown, that of fome infects is fo too.

FUNGIBLES, in Scots Law, are fuch things as are eltimated by number, weight, or meafure; as coia, butter, ale, \&c.

IUNGIT E, in Natural Hiffory, a kind of foffile coral, of a conic fizure, though fometimes flatted and Itriated longitudinally.

FLNGUS, in Surgery, denotes any fongy excrefcence. Sec Surgery Index.

FUNNEL of $a$ Chinsey, the thaft or fmalleit part of the waite, where it is gathered into its lealt dimenfions.

Palladio directs, that the funnel's of chimneys be varried through the roof four or five eet at leatt, that they may carry the fmoke clar from the houfe into the air. See Chivney.

He alfo advifes, that chamber chimneys be not made narrower than 10 or 11 inches, nor broader than 15 ; for if too narrow, the fmoke will not be able to make its way; and, if too wide, the wind will dive it back into the room.

FUR, or Furr, it commerce. See Furr.
FCRBISHER, a perton who farbihes, polinies, or cleans arm, as guns, fwords, fiftols, \&ic. which is
ehietly forformed with emery. Sce the aricle EMERY.

FURCA, in antiquity, a piece of timber refombling Furns. a fork, ufed by the Romans as an intrument of runithment.

The punithment of the furca was of three kinds: the firf only ignominious, when a matter, for fmall offences, forced a fersant to carry a furca on his thoulders about the city. The fecond was penal, when the party was led about the circus, or other place, with the furca about his neck, and whipped all the way. The third was capital, when the malefactor having his head fattened on the furca, was whipped to death.

FURCHE ${ }^{\prime}$, in Heraldry, a crofs forked at the ends.
FURETIERE, Antosy, an ingenious and learned Frenchman, was born at Paris in 1620 ; and after a liberal education became eminent in the civil and canon law. He was firt an advocate in the parliament; and afterwards taking orders, was prefented with the abbey of Chalivoy, and the priory of Chuines. Many works of literature recommended him to the puhlic; but what he is chiefly known by and valued for, is his Univerfal Dictionary of the French Tongue, in which he explains the terms of art in all fciences. He had not, however, the pleafure of feeing this ufeful work publithed before his death; which happened in 1688 . He was a member of the French academy ; and the difputes and quarrels which he had with certain members of it made a great noife in the world.

FURIA, in Zoolory, a genus of infects belonging to the order of vermes zoophyta. There is but one fpecies, riz. the infernalis, which has a linear fmooth body ciliated on each fide, with reflexed feelers preffed to its body. In Finland, Bothnia, and the northern provinces of Sweden, it was not unirequently that people were feized with a pungent pain, confined to a point, in the hand or other expolcd part of the body, which prefently increafed to a moft excraciating degree, and hath fometimes been fuddenly fatal. This diforder was more particularly obferved in Finland, cpecially about boggy and mariny places, and atway; in autumn. At length it was dicovered that this pain inftantly fucceeded fomewhat that dropped out of the a:r, and in a moment pentrated and buried it.eif in the ticih. The Finlanders had tried variety of applications to no purpofe, until at length a poultice of curds or cheefe was found the moft effectual in caling the pain: and the cvert confirmed that the ineect was allured by this application to leave the flelh; as, on its removal, this worm, no longer than the fisth of an inch, was found in it, and thus the caule of this painful difeale explained. But by what means this creature is railed into the air, is as yet unknown.

FURIES, in Pagan antiquity, certain godiefles whofe office it was to punilh the guilty atter death. They were threc in number: decto, Megera, and Tiliphone; who were delcribed with frakes intead of hair, and eyes like lightning, carrying iron chains and whips in one hand, and in the other tlaming torches; the latter to difcover, and the former to punihh, the guilty: and they were fuppofed to be conttantly hovering over fuch perfons as had been guilty of any cnownous crime.

Diythologits fuppofe, that Tiliphone punithed the crimes which frang from hatred or anger; Megare, L. 12

thofe from envy; and Alcato, thuic from an intatiable purfit after aiches and pleature. 'They nere womhipped at C.ina in A:cadia, and at Carmia in Peloponatus. They had a temple at Athens near the Arcopagus, and and their priets were cholen from anongit the judges of that court. At Telphulid, a city in Arcadia, a blach cise :uas lacrificed to them.

FURLING, in naval atfatc, fignifies the operation wi wrapping up and binding any fini clove to the yard; which is done by hating upon the clew lines, bunt-lines, ac. which wraps the fail clote tugether, and being cound ratt to the yard, the fall is futied.

FURLONG, an Lughin long meature containing the one-eighth of a mile, and therefore equal to $660^{\circ}$ feet, of 220 gatds.

FURLOUGH, in the military lanquage, is a licenfe granted by an officer to a foldicr to be abfent from his duty for a limited tinic.

FURNICE, is a veffe! or building, for the purpole of containing combuftible materials, whether of coal or woud, and io conitructed that great heat may be produced and concentrated. There is great variety of furnaces, and they are varioully conftructed, according to the vierrs of the operator, and the purpoles to which they are applied. But in all furnaces there are four things which requize to be particularly attended to. 1. To be able to concentrate the heat, and direct it as much as poffible to the fubftances which are to be acted upon. 2. To prevent the diffipation of the heat after it is produced. 3. To obtain the greateft quantity of heat from the fmalleft quantity of fuel ; and 4 . To be able to regulate at plealure the neceffary degree of heat, or to have it under proper management.

1. To accomplith the firt object, namely to concentrate the beat, it is ufual to confine the fire in a chamber or cavity, properly conftructed, furnihed with a door or opening, by which the fuel is introduced; a grate for fupporting it, and allowing a free paffage to the air, as well as for the afhes to fall through into the cavity below, called the a/b-pia In this way the heat produced by the combuition of the fuel is confined by the lides of the furnace, and fo concentrated that its force is chietly fpent on the fubitances inclofed.
To prevent it «ılipa: c .
2. The diflipation of the heat is prevented by keeping the door of the furnace fhat, by conitructing the chimney no wider than to allow a paffage for the fmoke, and placing the fubtance to be acted upon in fuch a manner that the fire may have its full effect as it goes up the chimney.
Tu produce the greatef Preportion
3. The third obje \&, which is not the leaft important, is to produce the greateft quantity of heat from the fmalleft quantity of fuel. In an economical point of view, this object is worthy of the greatelt attention, though it is ofren difficult to attain it. In this view much depends upon the proportion between the fpaces between the bars of the furnace, and the wideneli and height of the chimney. This is obvious from conidering the circumftances which regulate the procels of cembultion; for this depends on the cursent of air pafling through the combuftible matter. When the fucl in the furnace is kindled, a certain degree of heat is produced; but without a current of frell air paffing through the burning matter, the fire is infantly extinguilhed; and withvut this ftreum of frefh air the inflammation camot go en. But wt:a this takes glace, the air within the fir.
nace is rar fiec, and being no longer a balance for the Furster, exturnal ar, it is driven ap the climncy by a current of denier air, ruhing in at the oponings. This having pathed through the luel, is alfo raretied, and pafle off, giving place in its then to a new curent, fo that in this way there is a comtant tlux of air up the chimvey. From this it muft appear, that the greater the raretaction of the air in the fire place is, the greater will be the intenfity of the heat produced. By conftructing a furnace in a particular way, the heat may be fo mat naged that the under part of the climney may be nearly as flrongly heated as the fire place itfeli; fo that, although a flrong current of air pafles through the fuel, yet as the heat is ufelefsly fpent on the chimney, there is a great and unnecellaty watte of fuel. To prevent this, there is a contrivarce by which the throat of the chimney is occalionally contracted, by means of a fliding plate, which, when it is puhed in, cloles up the whole vent; but may be drawn out in fuch a way as to fom a larger or fmaller opening as may be thought nocefliry. Tiil the fuel is thoroughly kindled, and the furnce fully heated, the plate ihould be quite drawn out, fo that the largeit column of air which the furnace will admit, may pafs through the fuel. The plate is then put in to a certain length, and fo regulated that the fmoke may be prevented from iffuing at the door of the furnace. The current of air increales in proportion to the rarefaction of the air in the fire-place, and this increafes the inflammation of the fuel; and the heat now being refiected from every point of the furnace, excepting the narrow paffage by which the fmoke paffes off, becomes extremely intenfe. If a large quantity of fuel be introduced at once, it will confume flowly, and require little attention, in comparifon with thole furnaces where this precaution is not obferved. When the intenfity of the heat is not very great, the fliding plate may be of caft iron; but to refilt great degrees of heat, it will be found more convenient to have it made of fire-clay. But it muft be obferved, that the advantage derived from the fliding-plate is loft to thofe furnaces which are of a large conftruction, and where great quantities of metal are to be melted; and there it is commonly found, that the wafte of fuel is very great.
4. To attain the fourth object, namely, to be able to Method of regulate conveniently the degree of heat, a certain pro- regulating portion of air only is to be allowed to pafs through the the heat. fuel. With this view it is neceflary to have the command of the funnace below, becaufe the parts above are often filled with finall quantities of foot. To manage this in the mott effectual manner, the door of the afh-pit is to be perfectly clofed, and furnifhed with a feries of round holes which have a certain proportion to each other. In the furnaces conitructed according to Dr Black's direction, the areas of thefe holes are as 1,2 , $4,8,16$, \&c. in geometrical progreffion. Seven or eight of thefe in the door of the ath-pit give a fufficient command over the fire. When the utmolt intenfity of heat is required, all the paflages are thrown open, and the height of the chimney is increafed, fo that the height of the column of rarefied air being augmented, the motion of the current of air through the fuel is proportionably more rapid, and conlequently the heat of the furnace becomes more intenfe. In the conftruction of a furnace recommended by Macquer, another : Abe is applicd to the ah-pit, having the cxtremity

Y-rase mof ditant from the furnace vilient, and coadually tapering as it apf toaches it. By this centivanee, it was propoled to increale the velucity of the carrent of air as it pafice trom a wider into a therrowes tabe. But it is found that the air will not whimately move with greater welocity than if the tube were not applied. It may inded to utiful where the furnace is placed in a imall aportment, and the tube itielf forms a communication with the external air.

After thele preliminary obfervations on the general principles of furnaces, we propole, in the following treatife to give a fhort account of the conftruction and application of fome of the more important furnaces which are employed in the arts and manufactures.

But before we enter into the detail and defcription of particular furnaces, we thall lay before our readers the defeription of one which was invented by Meffrs Robertons of Glafgow, for the purpofe of confuming its own fmoke, and faving fuel.
Furnace for "To conilruct furnaces (fays the editor of the Phicomfoming lofophical Magazine, from which this account is taken), 1t. 0wn tinoke. on fuch a principle as fhould enable them to confume their own fmoke, has long been a defideratum; and we believe the public in general, but efpecially thofe who have been annoyed by the finoke of iteam engines, founderies, and fimilar erections in their neighbourhood, will be glad to learn that a furnace has been contrived which effectually gains this end.
" The conitruction is extremely fimple, and will be eafily underitood by the following defcription, and the plate to which it refers.

Fig. 1. reprefents a vertical fection, and fig. 2. a front view of a fteam-engine boiler, furnithed with one of Meffrs Robertons furnaces; and the fame letters refer in both to the fame parts of the contruction.
" The opening A, through which the fuel is intro* duced into the furnace, is thaped fomewhat like a hopper, and is made of call iron built into the brickwork $\mathrm{H}, \mathrm{H}$. From the mouth it inclines downward to the place where the fire relts on the bottom grate B . The coals in this mouth-piece or hopper anfwer the purpofe of a door (A), and thofe that are lowelt are by this means brought into a flate of ignition before they are forced into the furnace. Below the lower plate of the hopper $\mathrm{K}, e$ the furnace is provided with front bars G (B), which not only ferve to admit air among the fuel, but offer a ready way to force the fuel back, from time to time, from $c$ to $d(c)$, to make room for freth quantities to fall into the furnace from the hopper or mouth-piece. By this arrangement the fuel is brought into a ftate of ignition before it reaches the farther fide of the bottom grate, where it is itopped by the rifing

Erat, $l$, of the brich-work, fo that any finoke libecated 「u: a from the raw enals in the nouth-picee mull pafs over the fe thening cuals before it cm reach the tluc FEF . But this, though it woull caure a large quantity of the inuke to be burnt, nould not completely prevent the elcape and afcent of fmoke up the chimmey; for it is not merely necelary that the limoke thould be expofed ts a heat fufficient to ignite it before it efrapen : walef, at the fame time, a quantity of frefh air, able to furminh a fufliciency of oxygen for the combultion of the fmoke, can be brought into contact with it, it will !iill efcap in an undecompofed itate. The judicious admifion of freth air, in fuch a manner that it can reach the fmoke, without previoufly paffing through the fire, and parting with its oxygen in its palage, and in fuch quartity as not to cool the bottom of the boiler, but merely to caufe the fmoke to burn, conftitutes the chief merit of this invention ; and to us it appears that it will fully anfwer the propofed end. Below the upper fide of the mouth-piece or hopper, and at about the diltance of three-fourths of an inch from it, (this face being a little more or lefs, according to the fize of the furnace), is introduced a calt iron plate $a \mathrm{n}$. This plate is above the fuel, and the fpace between it and the top of the hopper is open for the admiltion of a thin fream of air, which, ruthing down the opening, comes firlt in contact with that part of the fire which is giving off the greateft part of the fmoke, viz. the fuel that has been latt introduced, mixes with it before it paffes over the fuel in the interior, which is in a high flate of combetion, and enables it to inflame fo completely, that not a particle of fmoke ever efcapes undecompoled.
" The quantity of air thus admisted to pars over the upper furface of the fire, is regulated by a very fimple contrivance. The plate a $n$ reits at each end on a itud, or pin, projecting from the cheeks of the month-piece $A$, or is furnithed at each end with a pivot which works in the cheeks; the faid pins or pivots being placed about midway between the outtide and intide of the mouth-piece or hopper, fo that, by elemating or deprefling the edge $a$ of the plate, the ofening at $n$ is enlarged or diminifhed. When that degree of opening which produces the beft effects is obtained, which is eafily known, the plate $a n$ is kept in its place by means of a piece of iron introduced above it, and anfwering the purpofe of a wedge.
" Under the grates is the afh-hole I, the upper part of which is furnifhed with doors SS, which, when flut, prevent the heat from the front bars $G$ from coming out into the apartment, and incommoding the workmen.
"Invited by an advertifement, we went to Meflrs Bunnell
(A) " In the management of this furnace, what is chiefly to be attended to is, that the hopper be kept full of coal, and either wholly or in part fmall coal, to prevent, as much as polfible, air getting in by that paltage; it is. alfo neceffary at fome times to ufe a chutter of thin plate-iron, to be applied to the mouth of the hopper to exclude the entrance of air by that paffage.
(B) "Thefe bars are, in fact, a grated door, kept in their pofition by a catch L, and which may be openeif at pleafure for cleaning the fire out. In fmall furnaces an opening here is all that is neceflary; the bas may be difpenfed with.
(c) " Between the back end, $c$ ', of the bottom bars, and the breaft brickwork $b$, is reprefented in the plate 3 fection of a fhutter, which is fometimes opened for the parpefe of getting out the refute of the facl.

## 1 U R [ $2 \% 0$ ] F U R

 see on of thefe furnaces at work, and we were not a letece fratified in oblerving that the fimalleft appearance of fmoke could not be perceived iffuing from the top of t.e chimney. The advantages of fuch an improvement ci. lardly be better illuffrated than by mentioning what had actually happened with this fleam engre. The fmoke, lefore the improved furnace was employed, incommoded the neighbourhood fo much, that it was fopped as an intolerable nuifance. Now it is fo far fom dilumling any one, that, without being admitted to lee the engine, it would be actually impoflible to know when it is at work.- Thefe furnaces, we underftand, have allo been adopted by many intelligent manufacturers at Leeds and at Nancheler. At the latter place, if we may credit newlpaper reports, feveral manufacturers have had their works indicted as nuifances for not having adopted the improvement; the magiftiates arguing, that, though the welfare of the place required that fuch incouveniences hlould be fubmitted to while no polible cure for them was known, the health and comfort of the inhabitants equally demand, now that the evil can be done away, that finoking fumaces thould not be permitted in the place.
"We cameftly recommend to owners of fteam engines, and alfo to thole who are annoyed by them, to endeavour to bring this improvenent into general ule. Indeed, we entertain no doubt of its being univerfally adopted fuoner or later; for it yields advantages not only in point of cleanlinefs, comfort, and health, but alfo in point of intereft; all the fmoke ufually difcharged at the top of the chimney, being in fact, fo much sood fuel, that only wanted the contact of frell air to inflame it under the boiler. It is a fact well known, that the flame which is often feen illising from the chimneys of founders, \&c. has no exiltence except at the top of the chimney : while afcending the flue it is only denfe fmoke, confiting of the azote of the atmofpheric air decompofed in patfing through the fire, of hydrogen, coal tar, and carbonaceous matter, of fueh a hish temperature, that it only wants oxygen to make it inflame fpontaneoufly : this it obtains from the atmofpheric air into which it afcends, and then prefents fuch appearances as would make a halty obferver adopt the opinion that the flame bad afcended, as flame, from the fuet in the furnace; which is by no means the cafe. A confideration of this fimple fact will convince any perfon that it is not an inconfiderable proportion of the fuel that is thus walled. Nor is this the only lofs fuftained; the quantity of heat required not merely to render fuch a portion of the fuel volatile, but to give to it a temperature able to produce the effeet of which we have taken notice, is itfelf furnilied at the expence of an extra and unneceffary quantity of fuel. The whole walle in many cafes is, we are perfuaded, not lefs than an eighth of the whole fuel employed."
Fiurnace for
() Die of the mof important furnaces, particularly for finclung
!on. this country, where, althowh great and effential improvements liave been made by induftry and ingenuity, the manufacture is yet in its infancy, is that for the fruclting of iron.

We thall therefore enter more fully into the detail of the hiftury, conlluction, and general principles of the nerration of blaft furnaces; and in tracing their pro-
grefine hitory, it my be obferved, that in this coun. Furnave try it has experienced a serolution, of which no an:. $\mathrm{H}^{-}$ gous intlance has occurred in other countres.

In the early and barbaous period of fociety, before Hiftory the introduction of agriculture, the furtace of a country is ulually covered with extentive forth. From this circumftance wood, as being moth accellible, abundant, and of eafieft application, is ufually employed by mankind for the purpofes ot fuel. In the progrefs of popalation and imptovement, other aovantages were derived from the general ule of wood as fuel; and among thele the improvement of the climate, and clearing land for the purpofes of agriculture, were sone of the lealt. The application of wood as fuel to different manufactorics, had ne doubt alfo an eatly origin; aud in the manufacture of iron, if conducted on a icale of any extent, the demand for fuel of this kind mult bave been very great. If, then, during the gradual improvement and profperity of this country, this mamufacture, in place of remaining ftationary, or declining, from diminifhed confumption, has increaled in capital and extent, with. out fome fubftitute for wood, the art would have been long before this time eatirely loft, becaule it depended on a floch which muft have rapidly declined, and even its very exiftence was often far from being compatible with the views and intereft of landholders. Such were the circumitances in which Great Britain was placed. from the reign of Charles II. to the middle of the 18 th century. During this period, being in a profperous ftate, the manufactures and commerce of the country increafed the demand for iron, while the fupply of wood, one of the moft neceflary materials in its manufacture, was greatly diminifhed. It is true, indeed, that, previous to this period, pit-coal had been employed as a fubititute; but the prejudice of fome, and the felfin views of others, and efpecially the want of fulficient mechanical powers, obftructed the prostefs of this mode of manufacture. When, however, thefe difficulties were furmounted, and it was found that the change of fuel in the blat furnace was likely to prove beneficial, this manufacture aequired new vigour, and improvements fucceeded each other in rapid fucceffion. In a period of about 50 years, a complete revolution was effected, not only in relinquining the mode of making iron with charcoal and in employing pit-coal in the blaft furnace, but alfo in the immenfe increale of the manufacture.

At what period the manufacture of iron commenced and pooin Britain, cannot be precifely afcertained. It has, refs ot, in however, been fuppofed, that the Phenicians, who Britain. wought the tin mines of Cornwall, may have introduced into the country men who were fkilled in metallic ores, and were capable of eltimating their value, by converting thefe mineral riches to fuch purpofes as their own neceibities, or the wants of the inhabitant, might require. It is probable alfo, that the invafion of England ly the Danes, and their ellablimment in this country, added fomething to their former knowiedge in the art of mining and manuficturing the ores of iron. In fupport of this conjecture, the large heaps of feoria found in many parts of England, and having a coniderable thicknets of foil apon them, have been denominated from time imnomonial, " Danes cinders;" and indeed fo early as the year 1620 , large oaks were found in a tlate of decay, upun the tops of tome of thofe hills

## I. U K

Furrace. of feotia. Bat although thefic may have been very ancient manactures, it is the lefs probable that the productivas of thete cinders is to be alcribed to the blath furbace; for at that remote period the manufacture was chictly direated to the fabrication of fimall portions of raalleable iron, in what were called fout-blats and b.comeries. The art of calling or moulding in iron was sether atorether unknown, or in in mede a Atate, that it could nos be prolecuted with mesi prolped of advantare. Pis us catl iron, if it was at ill produced, wa, then of the mot :efratury nature for ixing convested into malleable iron. It was not till a futare period, when improvement, had been made in machinery, and the advantage of a disifien of habour were known, that different furnace: were conitructed ; one for manuSaturing pig iron. and another for converting it into mallesible iron. To this the blat furnace dem to have owed its exifence, and it is to be confidered as 3 im provement of the adivarages which are derived from a divifon of habour. The blaft furnaces being exclufively appropriated to the m.king of pig iron, the attentive manefaeures would foon perceive that the products of the funtace were often diferent from each other. Re. peated obfervation and experience would enable him to alcettain what was the caufe of this difference. Obferving that an additional quantity of fiel rendered the forged pig iron more fuible, this circumance would fugzeit the practicability of calting it into thape. Hence probably arofe the art of moulding, which afterwards, as well as the bar-iron forge, became an appendage to the blit furnace. After this new manufacture became imiliar, the adrantage of dividing the product of the baalt furnace into gray melting iron, or into forged pig, according to the demand, would be obvious.
Number of In the year 1615, according to Dudley, who has Mrnaces in fated the fact in his Metallum .Martis, there were no England. lefs than 300 blat furnaces in Lngland for fmelting iron ore with charcoal, and each furnace was fupplied with fuel upon an aveage of 40 weeks in the year. Taking the suverage produce of pig iron at each furnace of 15 tons per weck, or 603 tons per annum, the tota? annual quantity vill amount to $18=0,00$ tons, which is a greater quantity than has ever been produced in Britain fince the feriod. It is fuppofed that this quantity imay be greatly esagnerated, but if the fame time it is allowed that the iron manufacture wa, at this carly period, hishly profperous and productive. Eut in the progref of agriculture and the increfe of population, it was necellary to clear the latd for the purpote of cu!tisation. From this circumtance, as well as from the great confumption of wood for the mas, the tuphly of fuel was greatly diminilhed ; fo that the iron manufacture became conderquently lefis productive.

It is curions :o remark that, althoung pitconal was fnowa long beefe this period, and was viruught at Newcattle previous to the year 1272, and grent quantities of it were amuilly evported to Hoiland and the Low Countrie", and wat wied in the tamitin forge, and uther manuactures which refuine a ftrong contiturd ireat, yet in England the prejudice agaimit its ufe in the manefacture of calt iron was to inveicrate, that when it was firit propolid and attemperd, every obstacle which wuld be deviifed was thrown in it way. During the seig: of james I. feveral patents were granted for the e.clufive privilege of manfacturing inan ith pit conl.

271 [ U ì
None of the adventurct, hosever, faceeded in theis if attempts till the year 1619, when Dudley made pigiron in a blaft furnace, but produced only three tons in the week. At this time the price of irun had rition, is confequence of many of the irom worh, having thopped for wint of wood as fucl. To thole manufacturers, therefore, who could still be furninhed with a fupply of wood, the manuticture was highly profitable, to that they oppoted any nes sttempt by which the price of iron was likely to be diminilied.

After this period, the prourefs of the iron manalac. ture was greatly interrupted from other caule'. Amidt? the diftraction occafioned by the civil wars which raged in England, little improvement was to be expected. It appears, however, that patents were graited during the Commonwealth, for the excluive privilege of manufacturing iron in the new way; and in one of thele, it was believed at the time, that the Protector himel: had a hlare. All thele experienced the fite of thic former, and no manufacture of any extent was luccelsfully eitaulifhed. In the year 1663 , Dulley in his ay' plication for his lail patent, itated that he could produce at one time feven tons of pig aron in the week with a furnace of an improved conatruation, 2 - feet fquare, and with bellows which one man, without inuh fatigue, could work for an hour.

Thar, as the demand for wood for the purpofes o: fuel in this manufacture increalid, and the growh c . timber was greatly diminimed, the manufaturer wa forced by necetlity to have recourfe to the wie of pitcoal ; and when various valutble improvements hat been made on machinery, and particularly when the bencticial effect, of the iltam engine hat been aicertained, the iron manufacturer faw himelf in poifelion of a command of power in the management of his ma. teria's, of which he had formerly no conception. The frall furnace fupplied with air from bellows contructed of !eather, which was moved by means of osen, holles, or men, went into difufe, when larger furnaces were introduced, with an increalic of the column of air, for the purpofe of exciting combuttion. But at this period, when the manumature derised new vigour from the introduction of the ftean engine, and the general inprovement in machinery, it icemet, from the operation of other caufes, and particularly from the dericiency of fiel, to decline rapidly. The demand for iron in the manufactured ilate, and particularly for bar irom, had increated, while the quantity produced gralually diminilled. Recourfe was now had to forei m marlects for a fupply, and the impontation of Rulfina and Suedih iron then commenced. Of the joz blat fumace fipokea of ly Dudtes, 50 on!y evift d; and erkimating their ammal produce at about 205 t m to exch furnace, the total amount did no: mush excedal 1-, 00 toms.

Such was the thate of the manufalure of irno in England and Wiate, before the introdution of pitcoal'; atud the it ap, care, that in a puriod of from 100 to tho years, it hat futfered a diminution of more than 50,000 tous anmatily. 1 proved of fingular benefit to this manafature, that the itcom engine, whith hat then becone a powefful mad hinc, was introdaced, for the furpofe of railing and comprefing the air, and eculd be emptoned in thofe phace where materiah, were abuadant, hat where there wis a deficirney of water fir moting the mathiners. Delide e coperience now tangh

Funace. the manufacturer, that the produce of his furnace conld be increafed by cnlarging the diameter of the fteam cylinder, for rendering the vacuum under the pillon more periect; and it was ioon found that, by increafing thefe effects, fuch a quantity of pig iron could be produced from the coak of pit coal, as would be attended with a fuitable profit. It is fearcely to be, wondered at, that this circumftance thould have long remained a fecret ; for a fmall quantity of air only being neceffary to ignite the charcoal furnace, whether it arofe from the peculiar inflammability of the fuel, or the fmall capacity of the furnace, it was ahways under the eye of the manufacturer, and he would more frequently experience the inconveniences of overblowing than underblowing the furnace. It feems too extremely probable, that pit-coal, being confidered in every refpect inferior to charcoal, the manufacturer would proceed with great caution in enlarging the column of air, or increafing its denfity; and thus the advantages to be derived from its ufe would be in a great meafure loft. When, however, experience had taught them a different leffon, the limits to the quantity of air that might be directed to a coak blaft furnace, before any injurious effects arofe, were not very obfervable. It was found, indeed, that the denfity of air diminithed the quantity of the produce, and the fame law feemed to hold with regard to pit-coal as well as to wood,-that the fofter qualities inight be overblown, while the ftrata of a denier and more compact confiftence remained undiminifhed before a heavier blaft.
mes into Between the years 1752 and 1760 the coak of pitstucral ufe coal was preity generally fubifituted for charcoal, in the blalt furnace. The iron manufacture affumed new vigour, and in a period of 30 years it experienced in Eingland and Wales a very remarkable progrefs. From the general and increafing ufe of pit coal, it is probable that many of the charcoal works were fooner relinquithcd than they would otherwife have been. The hittory of the celebrated foundery of Carron in Scotland, affords us a curious inftance of the progrefs of the ufe of fit-coal in this manufacture. Thefe extenfive operations commenced about the year 1760 . The blowing, is was the practice at the time, was performed by means of large bellows, moved by a water wheel. But as there was a feanty fupply of air, and as this was defirient in denfity, the weekly produce of the furnace rarely exceeded 10 or 12 tons, and often in fummer this , fuantity was confiderably diminifhed. With a view to improve the opcration, immenfe quantities of wood -harcoal were prepared, and it was found that the procefs of fmelting fucceeded much better with this kind of fael than with the mineral coal which was dug out in the neighbourhood. But in the improvement of machinery, more effectual menss were difcovered to prorure a blatt of fufficient force and denfity for the ignition of pit-coal, wheels of greater power were conftructed; the ufe of the bellows was relinguiked, and in their place large iron cylinders, fo contrived as to bluw both up and down, were introluced. Thas, a larger columa of air, of three or four times the former denfity, was obtaired, and the betwichal erie arifing from the improvements wele foon perceived; , the fame furnace which formerly produced 10 or 12 tons in the week, fumetimes yielded to tons in the furme time;
and on an annual average, not lefs than 15,000 tons Furnace. of metal.

About the end of the reign of Qucen Elizabeth, we are informed by Dudley, that blatt furnaces had been conftructed on to large a fcale, and with fuch a power of machinery, as to yield a daily produce of more than two tons of charcoal iron; but it is probable that fo large a produce could only be obtained in fituations where there was a copious lupply of water, and where the water wheels and bellows employed were of large fize. In the more ordinary modes of conducting this procefs, furnaces of a much [maller fize were employed, and thefe received the fupply of air from hand bellows which were moved by men, and fometimes by cattle. From the fuperiority of the manufacture of iron guns, mortars, \&c. England poffeffed at this time a confiderable export trade; but as pit-coal had not yet been applied to any departments in the manufacture of iron, it feems probable that thefe articles were caft from the large blaft furnaces, becaufe the flame of wood, comparing it with that of pit-coal, poffeffing but feeble effects, would render the application of the reverberating furnace (if it was then known), of no ufe in the calting of guns and mortars. The want of pit-coal in every department of the foundery, greatly retarded the perfection to which the art of moulding might have arrived, and even obftructed its improvement. The backward ftate in which the art of cafting and moulding long remained in this country, fhewed that the want of this material of the fmelting fuel in the blaft furnace was long feverely felt; and owing to this, other nations, who in many other refpects enjoyed fewer advantages, made more rapid progrefs in the improvement of this manufacture. Before this period, it is not improbable that the ule of pit-coal might have been fuggeited to the manufacturer, and that this matcrial, employed as a fuel, might have been confidered as an auxiliary, or as a fubltitute in various departments of the procefs. The intlammability of this fubitance, and its tendency to be converted into a cinder, as well as the general decay of wood, would afford fufficient ground for what might be confidered by many as a ufelefs fpeculation. The benefits of this manufacture as it then ftood, had been carefully inveltigated, and fully appreciated by thofe who were interefted in it. The fupply of wood only feemed to limit its extent, but for want of a futlicient fupply of materials, the eitabiifhment of new works became impracticable, thofe already engaged in the bufinefs were anxious to preierve the fupply they enjoyed, however limized, than encourage any innovation or change in the procefs, which, by the fubftitution of pitcoal for charccal from wood, would probably give to new adventurers and fpeculators a liperiority of the marke:. Bolides, many of the furnaces which were then ging, were at a great diftance from pit-coal, fo that the general ufe of this fubtance, and the advantages to be derived from it, would be highly injurious to their interelts.

S:ch was the flate of this mauffacture when the ufe of pit-coal in this procefs was difcovered, or when it was propofed to employ it for thi nurpote. With this view, James I. in the year 16 re 2 , granted a patent to Simon Sturtevant, for the exclufive menufacture of iron with pit-coal, for the period of 31 year. In obtainerg this

## F U 1

Famace privilege, the matote othiged himikif to : blblih a futh account of his diforeries, athe this appeated in a work in quarto, under the tite of " Netallica." It appears, however, that Sturterant had net fucceeded in his fchemes; for in the following year he gave up his privilege, but it is not known to what caules the fatiare is to be alcribed.
Another adventurer fan Ater Sturtevant, a Junn Rarmion emisgried in the e hazardous undertalins; and although he procured a patent without much trocile, he had foon to encounter dificulties in the way of ulimate fuccels, maloyous to thole which had prevailed over the perfeverance of Sturtevant, and induced him to relinguin the farther profecution of his fohemes. He oblained lis patent on conditions fimilar to thote on which his predecedtor procured it, in conequence oi which he publinhed his ". Netalica" in $\mathbf{1 6 1 3}$. All his fuccuiors were iike him, obliged to refign their patents from the want of adequate luccef.
Dudley ob- Dudiey procured his patent in the year 1619 . and tans a pa- notwithtanding lie affirmed that he manutaciured not tent. more than three tons per week, he found it a lucrative undertaking. This difcovery he brought to perfection at the works of his father in Worceiterihire; but by the infuence of thole who wifhed to thare in the entoluments ariling from the manufacture of iron with pitconl, his patent was limited to $1+\frac{1}{}$ inftead of 31 years. He informs us himelf, that, during the greater part of this period, he was enabled to fell pig and bar iron much cheaper than any of his competitors; but as his romarkable fuccet's drew their enry upon him, lis devoted trorks were at length delloryed y a lavirfi mob, urged on, it is fuppoled, to perpetr.te fo atrocions a - deed by his rivals in bufinefs. In this ummerited twatment of the fargaise hut unfortunate Dudley, the cone pig procet's unduetionably experienced an irreparable bois. He had io many rivals to contend with, by virtue of the oniginal ground be occupied as a manafacturer, and his attachment to the cauie of royalty was to fincere, that his improvenents were effectually prevented from arriving at latting of general utility. Could he have procured a new patent after the refloration, there is little doubt but lie wou'd have asain entered with avidity on the laborious paths of dilcovery. In petitioning for the recovery of his ancient privileges, we find him declaring that inftead of thre:, he was enabled to manufacture ieven tons per weck of coke pig iron, in confequence of a large furnace, and an improved bellows.
Autanus To ftand clear as much as polfinte of the method of to evale it. operation which Dudley had difcovered, one Captain Buck, Major Wildman, and fome other, conitructed large air-furnaces in the foreth of D can, into which they put clay pots, for containing the requitite preparations of ore and chareoal. Pit-coal was employed for the purpofe of heating the farnacer ; and it is highly prohsble that the fe nes adventuren were fanguine enourth to believe that, by tapping the pots below, the feparated metal would tlow out. This trange method of allidying was ioon found impracticable; for the heat was not of futhicient intenlity to produce an entire feparation; the pots gave way, and the profecution of this ridiculous icheme was fuecdily relinquithed

The manufacture of iron received no farther improvements for about a century after this period. It Vol. IX, Part I.

M, the ton of the bothes, 12 fect diwneter the eight feet of perpenticular beight. N, the top of the furnser, at which the materials are charged; commonly thrce fect diameter. MiN, the internal cavity of the furmere from the top of the bothes upwards, 30 tect high. Nis, total height of the intermet parts of the fimace, $44^{2}$ fut. OU, the lining This is done in the nicest maner with tire-bricks made on pupfe, 13 inches loag and three inches thick. PP , a vacancy which is left all round the outfide of the firt lining, three inches bioal, and which is beat full of coke-dun. This lpace is allowed for any expathion which might take fruce in conferutnce of the ivelling of the materials by heat when defeending to the bottom of the furnace. (l), the fecond hang, fimilar to the firt. $R$, a catt-inon lintel, on which the botiom of the arch is fupportad. RS, the nle of the atch. Sr , height of the arch; th the outhide iqfeet, and is feet wide. VV, the extremes of the hearth, ten feet fquare. This and the both-fiones are ahways mate from a coanfe gritud freellone, whole fracture prefents large rounded grains of quariz, connecied by nieans of a cement lefs pure.

Fig. 4. reprefents the foundation of the furnace, and a full view of the manner in which the falfe botion is conthueled.

AA, the bottom flones of the hearth. B, fratum of bedding fand. CC, paflages by which the vapours, which may be generated from the damps, are palfed off. 1)D, pillars of brick. The letters in the horizuntal vicw, of the fame figure, correlpond to fimilar letters in the cutted elevation.

Fig. 5. AA, horizontal fection of the diameter of the bolles, the lining and vacancy for ftutfing at M. C, view of the top of the hearth at L .

Fig. 6. vertical fide-fection of the hearth and boflies; flewing the tymp and dam-ftones, and the tymp and dam-plates. $a$, the tymp-itone. $b$, the tyanp-plate, which is wedged firmly to the ftone, to keep it firm in cafe of fipliting by the great heat. $c$, dam-itone, which occupies the whule breadth of the bottum of the hearth, excepting about fix inches, which, when the furnace is at work, is filled every caft with flrong land. This itone is furmounted by an iron plate of confiderable thicknefs, and of a peculiar flape $d$, and from this called the dam-plate. The top of the dam-llone and plate is two, three, or four inches under the level of the tuyere hole. The fpace betwist the bottom of the tymp and the dotted line is alfo rammed full of ftrong fand, and fonctimes fire-clay. 1 his is called the tymp-itopping, and prevents any part of the blaft from being unneceflanty expended.

The fquare of the bafe of this blaft furnace is $3^{8}$ feet; the extreme height from the falie bottom to the top of the crater is 55 feet.

Having given the above defcription of the conftruc- Mole of tion of the furnace, Mr Muhet next proceeds to take a operation. view of its mode of operation and management. "The operations (he obferves) I am about to defcribe have never as yet received any explanation confonant to true philolophy or chanical faets; yet there are few which prefent.

## F U R

samace. prefent a more beatiful chain of afinitics, decompofition, and recombination, than the manufacture of iton in all its various lages. An extentive foundery is a lirboratory fraught with phenomena of the molf interecting nature in chemittry and natural philofophy: are we not then juhly furprifed to find that prejudice altl rigns there ; and that the curions manipulations of thele regions are till thronded with error and mifeonception; as if their dingy flructure forbade the entrance of geniu; or configned her laborions unlettered fons to an eadlels ttretch of mental obfcurity :",

Having deferibed the firnace, he continues, "I Shall proceed to detail the train of preparation neceltary before the furnace is brought to produce good meiting iron.
" The furnace being finilhed, the botton and fides of it, for two feet up the fquare funnel, receive a lining of common brichs upon edse, to prevent the itone from
thivering or mouldering when the fire comes in contact with it. On the front of the furnace is erected a temporary firc-place, about $f$ ur feet long, into the bottom of which are laid correfponding bars. The fide-walls are made fo bigh as to reach the under-fiulace of the tymp-lone; excepting a fmall fpace, which afterwards receives an iron plate of an inch and a half thick, by way of a cover: This alfo preferves the tymp-ftone from any injuy it might futain by being in contact with the flame. A fre is nor hindled upon the bars, and is fel oceafion liy with Emal, coals. As the whole cavity $o^{\circ}$ the iumace ferves as a chinn+y for this free, the draught in confequence is volent, rat i... ooly othent catried up is very con iderabic. I t e vourfe of theee weeks the furnace will thus becom: entirely free from damn, and fit for the reception of the material : whan this is jadzed moper the fire-glace is removed, ut the interior batcks are allowed to remain thll the operition of blo ing commences. Some loole fuel is then thrown upor the bottom of the furnace, an 1 a few balkets of ruhes are introduced ; thele are alowed to become thonou, hly ignited before more are added. In this manner the fomare is graduaty filled; onetions entire ${ }^{1} y$ full, and at other times 5 Sths or 3 thes full. The number of batkets fail depend eatirely upon the fize of the furnace: that is the plate will contain $9: 0$ baikets. If the coal is fullint, the weight of each baf-ket-fall will be nearly 11 llo. $\times 900-=99,000 \mathrm{lh}$. cokes. As this quality of coles is matde with a lols of nearly 50 per cent, the orivial waigh in raw coals will re equal to $195,0001 \mathrm{~b}$. When we refie t that this vaft body of inted matter is replaced every third hw, when the fornace s proverly at work, a intion may be formed of the immeafe quanity of materials requilite, as alio the cuafequent indu'try everted to fupply one or more furnaces for the fpace of gice year.
"When the fur ce is faliciently heated through-
 furnare fimmace. enders ale added. Hise me calld charges. Chatsugit The cokes are commonly filled in tohe: $\begin{gathered}\text { as, when, at }\end{gathered}$ all the varions irom-worh, are neary $\omega^{\text {t }}$ a oc . The weight of a baket, however, cemendis entirciy upon the nature wad qualsty of the coal, hemy foom 7 th 112 lb . each (D). The iroa-fione is filhed tion Juser, which,
 fone ; they offen exceed this when the fone has been feverely roated. The timet charges which a forance te ceives, contain but a imal proportion of iton-tione $t$, the weight of colen: this is afterw rds increafed to a full burden, which is comn:only four bafkets ruke, 3201 b . ; two boxes iron itome, 112 lh . ; one bov ot blatt. furnace cindera, 60 or 7 olb . (E). At ne:s work s, where thefe cinders cannot be obtained, a fimilar quantity of limeltone is ufed.
"The defcent of the charge, or burden, is facilitated by opening the furnace below two o: three times a-day, throwing out the cold ciaders, and admitting, fur an hour at a time, a body of freth air. This operation is repeated till the approach of the iron-ftone and cinter. which is always amounced by a partial fufion, and the dropping of lava through the iron bars, intruducel to fupport the incumbent materials while thole on the bot tom are carried away. The filling above is regu'arly continued, and when the furnace at the top has acquited a confiderable degree of heat, it is then judged time to time to introduce the blait ; the preparations necellary for which ap in the are the following :-
"The dam tone is had in its place firmly imbedled in fire-clay; the dam-plate is again imbedued on this with the fame cement, and is fubject to the fame inclination. On the top of this plate is a ilight depreffion, of a curved form, towards that fide fartheit diftant from the blat, for the purpofe of concentrating the foria, and alluwing it to How off in a connected itream, as it tends to larmount the level of the dam. From thi notch to the level of the floor a declivity of brich-work is erected, down which the foria of the furnace tiow in large quantities. The opening betwixt the dam and fide-walls of the furnace, called the fauld, is then built up with fand, the loofe bricksare removed, and the furnace bottom is covered with powdered-lime or charconldult. The ignited cokes are now allowed to fill down, and are brought forward with iron bars ne:trly to a level with the dam. The frace between the furlace of the cohes and the bottom of the tsmep-plate is nest rammed hard with flomg binding tadd; and thefe coker, which are expoled on the outhide, are covered with coke-dut. Theie precautions being taken, the tuyere-hole is then opened and lined with a foft misture of fire-cliy and loam: the lhat is commonly introduced into the furnace at tirl with a fmall didharging-pipe, which is afterwends increafed as encation may re fuite. lat iwo
$\mathrm{Mm} 2 \quad$ hours
(a). "This fame varic:y in the coal renders it ahmot immotible, uncer one defeription, to give a juft ilda of the froportions ufed at various hlaft furnaces: to avoid being tom diffule, 1 thall confane ony defeription conmeded with a coal of a medium quality, or a mixture of folint and free-coal, a baket of which will weigh from ? $\$ 1 \mathrm{~h}$. to 8 illo.
(1. ". A preference at firft is alway given to blalt-furnace cinders in phace of lime; heing already beri fous. they are of much catier fufon, and tend to preferve the furface of the learth hy glazing it over with batis vadic:ul?

## $F \quad$ U R

Furnace. hours after blowing, a confiderable quantity of lava will he accumulated; iron bars are then introduced, and peliorations made in the comprefled natter at the botthm of the furnace; the lava is admitted to all parts of the bearth, and foon thoroughly lieats and glaces the furfaces of the fire-flone. Shortly after this it riles to a level with the notch in the dam-plate, and by its own accumulation, together with the forcible action of the bhall, it thows over. Its colour is at frit black; its fraclure denfe, and very ponderous; the form it aflumes in running off is flat and branched, fometimes in long shreans, and at other times lefs extenfive. It the prefaration has lren well conducted, the colour of the cinder will foon change to white; and the metal, which in the flate of an oxyce formerly coloured it, will be Ielt in a difengaged itute in the furnace. When the metal has rifen nearly to a lesel with the dam, it is then let out by cutting away the harkened loam of the fauld, and conveyed by a channel, made in fand, to Fufel mee- its proper dettination; the rrincipal channel, or rumtal let out. ner, is called the fow, the iateral moulds are called the $p$ r.

* 1r fis days after the commencement of blowing, the furnace ought to have zurought herfiff clear, and have acepured capacity faticient to contwith from 5000 to 7000 weinht of itm. The quality ought alfo to be richly carbonated, fo as to be of value and efthmation in the pis-market. At this period, with a quality of coal as formerly mentioned, the charge will have increafed to the following proportions :- Five balkets cokes, +oolb.; fix boses iron-flone, 336 lb .; one box limetione, roolb.
"An analyfis of the fmelting operation, and the tendency which the individual agents have to produce change in the quality and quantity of the iron, come next under confideration. Let us, however, firft notice the characteriltic features exhibited by the different kinds of iron while in fuhion, whereby the quality of the metal may be jultly defincd.
Characters rithe pro. chee,
- When fine ( $\mathrm{N}^{\circ} 1$. ) or fupercarbonated crude iron is run from the furnace, the flream of metal, as it iflues from the fauld, throws off an infinite number of bril- liant fparkles of carbone. The fulface is covered with a fluid pellicle of carburet of iron, which, as it flowe, rears itlelf up in the moll delicate folds: at firft the fiuid metal appears like a denfe, ponderous itream, fut, as the collateral moulds become filled, it exhibits a general rapid motion from the furface of the pigs to Che centre of many points; millions of the fineft unduations move upon each mould, diflaying the greateit : icety and rapidity of movement, conjoined with an uncoinmonly beautiful variegation of colour, which i.anguage is inadequate juflly to deferibe. Such metal, ${ }^{13}$ quantity, will remain fluid for 20 minutes after it is run from the furnace, and when cold will have it, furface covered with the beautiful carburet of iron, alseady mentioned, of an uncommonly rich and billiant - apearance. When the furface of the metal is not carLureted, it i. invoth like forged iron, and always con©.a. In this flate iron is too rich for malting without - ne adhitum of coarie metal, and is untit to be ufed in a rupula furmace for makity the callioge, where thinuefs siol. a roud thin are requilite.
" tor whenated crude iron, when ifluing from

furface a vaft number of metallic fparks: they arife Furnace. from a different caufe than that exerted in the former inftance. The extreme privation of carbone renders the metal fubject to the combination of oxygen fo foon as it comes into contact with atmotpheric air. This truth is evidently manifeited by the ejection of fmall fpherules of iron fiom ail parts of the furface: the detlagration does not, however, take place till the globule has been thrown two or three feet up in the air; it then inflames and feparates, with a plight liffing explofion, into a great many minutc particles of brilliant fire. When thefe ate collected they prove to be a true oxyde of iron, but fo much faturated with oxygen, as to poffefs no magnetic obedience. The furface of oxygenated iron, when running, is covered with waving tlakes of an obfcure fmoky tlame, accompanied with a hifling noife; forming a wonderful contraft with the fine rich covering of Plumbago in the other flate of the matal, occafionally parting and exhititing the iron in a flate of the greatent apparent purity, agitated in numberlefs minute fibres, from the abundance of tlic carbone united with the metal.
"Wher iron thas lighly oxygenated comes to reft, fmall fpecks of oxyde begin to appear fluating upon the furface: thefe increale in hize; and when the metal has become folid, the upper furface is found emirely covered with a feale of blue cxyde of various thickneffes, dependent upon the ftage of oxygenation or extrome privation of carbone. This oxyde, in common, contains about 15 per cent. of oxygen, and is very obedient to the magnet. In place of a dark blue fnuoth furface, conves and richly carbonated, the metal will exhibit a deep, rough, concave face, which, when the oxyde is remosed, prelents a great number of deep pits. This iron in fufion thands lefs convex than carbonated iron, merely becaufe it is lefs finceptible of a flate of extreme divifion; and indeed it leems a principle in all metallic fluids, that they are convex in proportion to the quantity of carbone with which they are faturated. This iron flows dead and ponderous, and rarely parts in fhades but at the diftance of fome inches from each other.
"This is a light lketch of the appearance of the two extreme qualities of crude or pig iron, when in a Itate of fufion. According to the divifion formerly made, there Itill remain two intermediate ftages of quality to be defcribed: thefe are, carbonated and carbo-oxygenated iron; that is, $\mathrm{N}^{\circ} 2$ and 3 of the manufacturers. Carbonated iron exhibit, like $\mathrm{N}^{0}{ }_{1}$, a beautiful appearance in the rumner and pig. The breakings of the tiuid, in general, are lets tine; the agitation lefis delicate; though the dividion of the fluid is equal, if not beyond that of the other. When the internal ebullition of the metal is greatelt, the undulating thades are imaileft and noft numerous : fometimes they affume the thape of fmall fegments ; fumetimes fibrated groups; and at other times minute circles, of a mellower colur that the ground of the thid. The furface of the metal, expoled to the external air, when cooling is generally dightly convex, and full of punctures: thele, in iron of a weak and futible nature, are commonly fimak in the diameter, and of no great depth. In flrong metal, the punctures are much woder and decper. 'This criterion, bowever, is not infallible, when pig-iron of different works, is takea collectiscly. At eachindivilual work, however, that iron wil! be flronge!t whofe honeyconbs atc 1.rge and deepen.
- Carbo

## $F$ U R $\left[\begin{array}{lll}277\end{array}\right] \quad F \quad U R$

Eurnace. "Carbo-oxysenate l, or $\mathrm{N}^{0} 3$. piq-iron, runs fmothly, withut any great degree of coullition or difengagement of metallic tparks. The partings upon its furf ice are ionger, and at greater diltances from each uther than in the tomer varietics; the thape they aflume is cither elliptical, circuiar, or cusved. In cooling, this me:d accutres a contaler ble pertion of oxyde; the furface is , either ruarhedly convex nor concave; the panturs are lels, and frequently vanih altogether. 'Their abferice, however, is no token of a linouth face fucceeding: in quanities of crude iron osygenated beyont this, I have already mentioned that a concave fufface is the confequence of the extreme ablence of carbon; and that, in proportion as this principle is ablent, the furface of the iron acquires rougheds and alieesity.
"It may pernops be proper here to mention, once for all, that although, for convenience, the manufazturer has, from a jutt eitimation of the value of the metal in a fublequent manufacture, aliised certain numbers for determinate qualities of iroi, yet it is difficult to hay at what degree of fituration of carbone each refpective term commence: fuffice it then to fay, that the two alterative principles, oxygen and carbone, form two diftinct claffe, that in which oxygen predominates, and that in which carkone predominates; the latter comprehend $\mathrm{NO}^{\mathrm{t}}$ and 2 of the manufaturers, the former includes oxygenated, white and mottled; and the equalization of theie mixtures form, as has already been noticed, the variety of carbo-oxygenated crude iron.
" I hall now obferve fome things relative to the various faces which crude iron allumes. $\mathrm{N}^{\circ} 1$ and 2 , with their intermediate qualities, poifels furfaces more or lefs conves, and frequentiy with thin bliters: this we attribute to the prefence of carbone, which being plentifulby interfperfed betwint and throughont the particles of the metal, the tendency which the iron has to thrink in cooling is entirely done away; it tends to dilkend the ageregate of the maf, and to give a round face, by gradualisy elevating the cemral parts of the furface, which are alway. lan to lofe their tuidity.
" Asain, that quality of i:on known by the name of $\mathrm{N}^{3} 3$, or carbo-oxygemated, is moll commonly found with a ilat furtace. If we till farther trace the appearance of the fuzface of pig iron, when run foon the furrace, we thall find $N^{\circ}$ 4, either wit' a white ur mottled f:acture, pofieded of concave faces rough and decply pitted. Preyond this it may be imasined that every degree of futber oxygenation woad be productive of a furface deeper in the curve, and rougher, with additional apperities. The contrary is the cafe: when crude iron is io far debnfal as to the run from the furnace in clotted lurans highly oxyge:ated, the furface of the figs is found to be more colvex than that of $\mathrm{N}^{\circ} \mathrm{I}$ iron; but then the fracture of fuch metal prefents an imfure mafs covered on both faces with a misture of usydated iron, of a liucih colour, rearly metallic. In ihort, this quality of irn is incapable of receiving furb a degree of ficid 'y as to enat?e us tu indge whether the convexity of in furface is peculiar tio its itate, or is oning to its u...t of discion as a tiuid, wherelay the gredual con.olicatide of the mettil i preverited.
"Hece teatu: eo falliciently dinligesim betwixt the antonquatisies of crude iron after they ate ontaned trmon la: lat fimare: the:c are, hosever, criterions

## F U R

 the varion, thto of colouring which is found in the columar mafs. When by accident a quantity of this lava runs back upon the ditcharking-pipe, it is upon the return of the blat impelled with fuch velocity as to be blown into minute delicate fibres, fmaller than the moit duatile wire; at firt they tloat unon the air like wool, and when at reft rety much refemble that fubjlance.
"The prefeace of oxygenated crude iron ( $\mathrm{N}^{\prime} 4$,) on the fun nace-bearth, is indicated by the lava refoving itfelf into long flreams, fometimes branched, tometimes columnar, extending from the notch to the lowest patt of the declivity; here it commonly forms large, that, bllow cates, or inclines to form conical figures: thefc are, however, feldom perfect; for the quantity of fluid lava, conveyed through the centre of the column, accumblates fafter than the intermal fides of the cone are confolidated; and thus, when the itruture is only half finilhel, the fmall crater vomits forth its fuperabundant lava, and is demolithed. The current of fueh lava falls leavily fr om the dam as if furcharged with metal, and cmite dark sed farks refembling the agitation of flraw embers. Its colour is ftill more varied than the former elefcriptions of fcorix, and is found changing its hues through a great variety of greens thaded with browns. Another variety of foria, which indicates the fame quality of iron, aifumes a fimilar form ; but has a tlack ground colour mixed with browns, or is entircly black. When the latter colour prevails, the texture of the cinder becomes porous; the quantity of iron left is now very confiderable, and fuch as will be eafily extracted in the affay-furnace with proper fluxes. In cafes of total derangement in the furnace, the fcoria will fill retain this black colour, although the quantity of metal may amount to 25 per cent.; the fracture, however, becomes denfe, and its fpeciic gravity increa es in proportion to the quantity of metal it hoids incorporated.
"The next lource of information, as to the quality of the iron in the furnace, is to be got from the colour of the fcoria upon the working bars, which are from tine to time inferted to keep the furnace free from lumps, and to bing forward the foria. When faper-carbonated crude iron is in the hearth, the vitrid craft uon the bars will be of a black calour and finooth furface, filly covered with large and brilliant plates of piumbago.
"As the quality of the metal anproaches to $\mathrm{N}^{3}{ }_{2}$. (carbonated), the carburet unon the fcoria decreales both in point of quantity and lize.
"Whan carbo-oxygenated iron ( $\mathrm{N}^{\prime} 3$ ) is in the furnoce, the working bars are always coated with a lighter coloured froria than when the former varicties exilt ; a fpeck of plumbago is now only fo nd here and there, and that of the fin melle tez. When the quality of the met $A$ is osygenated ( $\mathrm{N}^{\circ} 4$. ), not only have the plates of cethuret difappeared, but alfo the coally colour on the exiernal furfare of the fouria; what now attaches to the bars, is nealy of the fame nature and colour as the lava emitted at the notch of the dam.
" Thisen criterins ase infallible; for, as the funbility or candontion of the metal is promoted is a direct ratio to the compasative quantity of the coaly pameiple in the furnace, fo in the fame prowation siti the sitrid chu? encircling th: working bat eshitit the prefones of that principle $\cdot$. it fumace.
"In the fmelting operation a juft propertion and ar- Fus: a.e. fociation of materials and mechanical conflruction onght to be blended, in order to produce the beit poilible effeets. Under the former are comprehended the cokt:, iron fone, limettone, and blaft ; by the latter is underflood the furnace, the power of the blowing-machine, or the compreflion and velocity under which the air is dichatged into the furnace, and the genius or mechaticat fhill of the workmen. According to this divition I thall endeatour to point out the very various effects which difproportion in any cafe produces, and vice erre.
"In the preceding obfervations the coal and iron ftone have been traced through their various flages of preparation, and that flage pointed out in which they were molt fuitable for the proftable manufacture of the metal. It will be neceffary to carry along with us this fack, that in the exact proportion which the quantity of carbone bears to the quantity of metal in the ore, and its mixtures, fo will be the fumbility, and of courle the value of the pirg-iron obtained. The importance of this truth will fill farther appear when we confider the very various quaities of pit-coal, the different proportions of carbone which they contain, and the various properties ataclied to ever: fecies of this ufeful combuitible.
"Amone the many ftrata of coal which I have diftil- "Jature of led, fone I have found to contain 70 parts in the 100 coal exam Tivis larse proportion is peculiar to the clod-coal, ufed aned. at iome of the iron-works in England, and juhly preferret, for the purpofe of manutacture, to the purelt and hardela varicty of lplint-conl. The later I have found to average frim $5=$ to 59 parts of carbone in the 100 ; and the foft, or mxed $q=a l i c e$ of coal, from +5 to 53 parts. Such various propo tions of carbone plainly point out, that the operations to be followed at each individual iren-wosk ought not to reft upon precedent, unlef borro ed from thofe works where exally the fame quaity of coa! is ufed. This malyfis allo lays open part of the fource from whence originates the widely different quantities of metal produced per week at various blatt-farnace, and the great difer'portions of ore ufed to different coals.
". Exierience has fhem that the three qualities of coal jult mentioned, will fmelt and give carbonation to the fullowing proportions of the fame fecics of torrefied iron tune:
112 lb . of clod-coal cokes will finelt - 130 lb . 112 lh . of f lint-coal cokes will imelt - 105 lb . 112 lb . mixed fuft and hard coal cokes will fmelt $8 \notin \mathrm{lb}$.
" Let the iron tlone be fupnofed in the blat furnace to yield 40 per cent. then we find that the one-twentieth of a ton of the refpective qualities of cokes will fmelt and cartonate the following proportions of iron, viz. 112 lb . clod-coal cokes, 130 b . iroa hone, at 40 pt cent. $=52 \mathrm{lb}$. irun; 112 lb . of fplint-coal cokes, 105 lb . of the stone $=421 \mathrm{~b}$. of ion ; and 112 lb . foft and hard coal eukes, $s_{+} \mathrm{mb}$. of the iron flone $=33 \% \mathrm{lb}$. of ron. We then have for the quantity of metal produced by one ton of each quality of cokes:
Clud conl $52 \quad \times 20=1010 \mathrm{lb}$.
Splint ditt) $4^{2} \times 20=8+0 \mathrm{lb}$.
Mixed dito $33 . \times 20=702 \mathrm{lb}$.
" Jinis farmines a datum whereby we eanly obtain

Birerence, "linete urent diproputions of quantity, ufed to s...
 from difer-quality of crude ion, will convey a alriking and inet ho preftive iba of the multifariuns guaitics of cual which
of coat. may be applied and made to produce the lame enects. It ihould alfo convince the masuacturer that the ftudy and analys of his own materials is the firt and radic.al approach to trac knowledge, and certainty of operation. Divet him of this knowledge, and view him guided by the cuitoms and rules prevalent at another manaticlory, $v$ here the coa!, and ores may be as different as has been already mentioned, and we will no longer wonter at the uncertainty of his reults, and the numberiets errors of his direction.

* Before I enter into the prafical difuffion of the application of coal, I beg leave to indulge mylelf in the following calculations:- We have already foen that the production of $22+0 \mathrm{ll}$. of carbonated crude iron requires $492+\mathrm{lb}$. of clod-coal cokes; theic may be averaged to contain 4.5 per cent. of athes, which, deducted from 4824 , gives 4607 lb . of carbone wied for one ton of metal : this fum, divided by 2240 , farther give for one lb . of caft iron thus manufactured, 2.055 lb . of carEone.
"We next find that 2270 lb . of the fame metal requires of fplint coal cukes 5973.3 l ', ; we farther find, from a table of the analytis of coa!, fummed in a former paper, that $1=0$ parts of the raw coal contaned

* In fething for a folution of the letter twe , we mu? have recuun e to the diferent degreas of inflammability of the cinome, accordine to the various laws of conti1.uity impoled upon it in its folith coutaraction. It can eanily be conccived, that, owing to this itrusture, and the nature of the interpoled ahh.s, the particles of carbone of tome cohes will be more ealily oxygenated than thole of others; in the fime way that we find fplintcoal, when expoled to ignition in contact with open air, affords ose-third of more cokes than are obtained from fort mixed coals, $t^{\text {th }}$, ught the latter, when ditilled, yiteld more pure carbone than the fornter.
* Ey eaperiment it is pruen that 100 grains of carbonic acid gas is compctid of 72 parts of oxygen, united with 2 '3 pats of carbone: if the quantity of the carbone of clod-coal, viz. $2.2 ; 6 \mathrm{lb}$. ufed for the manufacturing of croy pound of caft iron, is reduced to grame, we will find it to confit of 14392 grains; this, divided by 28 , gives the aciditable principle of $5 t$; $\times 100=51400$ grams of carbonic acid gas $(\mathrm{r})$ : hence, as one cubic foot of this gas, at $29.8 f$ of barometricat preffure, and 54.5 of temperature, weighs nearly 761 grains, we find that in the formation of every pound of calt iron $\frac{51400}{761}=67,5+$ cubical feet of carbonic acid gas will be formed; and in the proluction of one tor of metal, the atlonithing quantity of $151259,6=$ cusic fet. This quantity, honeser incredible it may lien is only what would be forned under the nbove prellume, and at the above temperiture : when we take into the account the hight temperatute at which the decompoti tion and recombination are effected, with the comie
(F) "This is fuppoing, for the momet, that the whole of the carbone is oxygennted, cither bey tie oxyge . comained is the ore, of chained from the difchargingesine by the decompolition of the atmulpuctic is: :hit, however, is not fricily tane, as the metal tahe up a folll portion, by meight, of the carbonce, and when, fy accicent, moifture has leen introdeced intu the furnace, (ither throush the medium of the blat, or of the mati: rial, its decompofition furnihes a portion of both onyecon and hydrogen, which may diflos., and atiurany of a part of the carbore. Ammbleris air hein; tund to hold water in folution, a finall gamtity of indro.... pill, twea in the wikit iowler, be prefent in the blafl furnace,

I: $\quad$...rende of clallic force and of volume, our ideas ate ansh undie to commenfurate the fum of the gas houry fumed, and thrown off, ignited to the ligheit degree of heat.
" If the fame mode of calculation is adopted with the other qualities of coal, we will have the following refalt:
"For the fplint-coal $2,4+2 \mathrm{lb}$. or $\frac{17094}{26}=610,5 \times$ $100=61050$ grains of carbonic acid, which gives $\frac{610: 0}{761}=82,55$ cubic feet for 1 lb . and $52,85 \times 2240$ $=1 \times 5,5^{3}+$ cubic feet for one ton. For the mixed coal $2,59_{3}$ or $\frac{20881}{23}=710 \times 100=71000$ grains carbonic acid: that is, $\frac{71000}{761}=93,3$ cubical feet for 1 lb .; and $93.3 \times 2240=208,992$ cubical feet for one ton. By the lame calculation we nay attain a pretty accurate notion of the quantity of atmofpheric air necelfary to produce 1 lb . or one ton of catt iron; an average of the three varieties of coal will be fufficiently accurate for this purpofe; thus $\frac{1+392 \times 1709 \pm \times 20881}{3}=$ ${ }^{1} 455 \frac{2}{3}$ or $2,4935 \mathrm{lb}$. of carbone are confumed upon the average of each pound of pig-iron : this is found to produce of carbonic acid gas $\frac{1-455^{\frac{2}{3}}}{28}=62.341 \times 100$ $=62.30041$ grains; which again divided by 761, the drains in one cubic foot gives 81.86 cubic feet for the gas difcharged in manufacturing one pound of caft iron, Is carbonic acid contains, as has already been nuticed, I2 paits of oxygen in 100 , then we have for the quantity of oxygen gas $100: 72:: 62400.41: 44856.29$ gtains oxygen gas ; and as, at the ordinary temperature and preffure of the atmofphere, a cubic foot of oxygen Fas weighs 591 grains, we find $44^{8} 56.29$ divided by $\therefore 91=75.89$ cubic feet of oxygen gas neceffary to form the acidifying principle of 81.86 cubic feet of carbonic acid gas; and that the fame quantity of oxysen gas is neceflary to the production of one pound of carbonated crude iron. This leads us to the following natement for the quantity of atmofoheric sir wied curing the fame operation ; firft premilng that the comtituctut parts of atmofpheric air are neally 73 of azote and 27 of oxygen gas; of atnofpheric air thea noceflary, we lave $27: 100:: 75.89:=81$ cubic fort.

* I li, all now preceed from more celculation woter of fea, and attompt to prove the correcinef of the fommer Ly the approximation of the latter $w$ its refuits. Let a blall-fumsce be uppofed to produce $20^{\frac{8}{8} \text { tons of }}$ pig it on ree weth, $=45360$ sverdupaife pounds ; this, diviced by clays, buur, minu+e, and feconds, wives per diy 6485 pounds, per hour 272 . per mintite $3 \frac{1}{4}$ lu. and per ferond $; 25$ grains.
" From this it is e:ident that one pound of caft iren i) produred in $133^{\circ}$. fecond ; expenience has the on that a blat-turnace, producing, in any of the .bove pertoci, we refpecive quantity of metal, ectires a dif-- Hatac of air per mitut acaly "1.al to $\$ 350$ cabic fut ; +1i, divifed by +5 3h. the quatity produred per matate give, for one pull of iron, $3=0 \mathrm{c}, \mathrm{bi}$ feet. The quantiv, by akuation, we beve feen be 28 a cetic fect, dificrence 19; a tum no way confiderable
when we retlect upon the inequality of the movements Fwnace. of a blowing machine, and when it is recollected that fome allowance ought alfo to be made for what air may pufs thonygh the furnace undecompofed, or may be loti at the place of entrance.
"From this coincidence of theory with practice, we cannot help admining the rigorous principles on which the Lavoifierian fyitem is founded; nor are we lefs pleafed to find, that, fmall as the eperations of the chemit may be, yet they are a jult epitome of what takes place is the philotophy of extenfive manufactories. The following table exhibits the quantity of carbone which may be ufed upon an average, with the relative quantity of carbonic acid formed, and air ufed:
" In the manufacture of $1.1 \mathrm{~b},-1$ ton of iron, The pure carbone requifite is $2.49-5585.44 \mathrm{lb}$. Carbonic acid formed $\quad 81.80-183366.40$ cub. ft . Oxygen gas ufed $75.89-169993.60$ cub. ft. Atmofpheric air employed $281.00-629+40.00$ cub. ft.
" From the foregoing particulars upon coal may be learned how much is dependent upon the native conflruction of coal and its conflituent parts; I thall next advert to the efiects produced by its improper preparation.
"When coals intended for the blaft-furnace are fuf-o ${ }^{\text {alalitics of }}$ ficiently charred, they ought, in point of colour, to be well-charof a lilver-gray; their fracture will appear lamellated red coal. and porous if iplint-coals have been ufed; fofter coals form themfelves into branches lightly curved, and, when properly prepared, are alwass very porous. I have frequently found that the better the cokes were charred, the more water they will abforb. Coals half burnt do not take up half fo much water, becaufe their fracture continues in part to be fimooth and lefs porous than when thoroughly burnt.
" When half-prepared cokes are introduced into the furnace, the metal formerly carbonated will lofe its gray fracture, and approach to the quality of oxygenated iron. Their prelence is eafily detected by the unufual quantity of thick vapour arifing along with the Hame. Befides, the water and lulphur, which raw coals introduce into the furnace, and which always impair the quantity of carbon by the various folutions efte\&ed by the prefence of oxygen, hydrogen, \&c. the fitnefs of the coal for combultion, and the fupport of the ore, is much diminilhed by this lecond courfe of ignition and difengagement of bitumen. The preflure of the incumbent ores alfo fracture and reduce the cokes into linall pieces, which produce a confiderable portion of coke dult; this is partly carried to the top of the furnace before the blall ; fometimes below it appears in immenle quantities, ignited to whitenefs, and liquid as fand. Coal thus detached from the maf;, expofed to the ation of a compreffed current of air, is unfit for conseying the carbonic principle to the metal; and as it frequently bclongs to the juth proportion of charcoal necefliry to limelt the ores, and to carbonate their iron, is lols mult be felt, and the quality of iron impaired.
"When cokes of any quality are expofed to a moilt enects of atmofphere, fo as to abforb water, their effects in the cokes greatblaft furnace become much reduced, and the prefence ly diminifhof the water is productive of the moll hurtful confe- ed by abquences in the production of carbonated crude iron. I forbing have found, by repeated experiment, that one pound of

Farnace. well-preparci culocs will, when iadia werer, the up $\left.{ }^{3}\right\}$ ounces in the face of hati an loour; at this ate, a bafket of cokes seighing S:lb. faturated with water, will contain 1.42 untuc of water, or $\delta$ ? lib. If the charge contain, fix baket, then ne lee that upwards of $5=1 \mathrm{~b}$. of water is introluced regularly along with the charge, furmihing an additional guantity of oxygen equal to $42^{\circ} \mathrm{lb}$. and of hydroyen equal to $-\frac{1}{3}$.; but it fieruently happens that the cones contan a larger portion of water than is here ifned. Whan coke thus furcharged are introduced in quantity into the blat furnace, the quality of the metal is not alwas, int:mtoneounly changed, and frequently the colour and form of the cinder temain lung withut any great alteration. The contact of wetted cohes with the ore is fint leen by the great difcharge of pale blue gas, with the whiter Hame at the top of the furnace; neat, the accumulating oxyde upon the furface of tie pig when contolidating indicates their prelence. Iron thus onygonated freguently exhibits, while mluid, that agitation and delin.te Frtings peculiar to carbonated metal: the remelting of thim iron is never attended with advantage, and is always u:profitable to the founder.
" From the properties which have been alfigned to pit-coal, the folloning facts may be dedu-ced:- Tlat charcoal is the batis of the manuticture of crude iron: that its proper application prodecer the moat whable qualities of pig iron; that, by diminibing its relative proportion, or contaminatisg itc quality by heterogencous mixtures, the value and fuibility of the metal is lult; but that, by a proper increale, and always in proportion to this increafe, will the fufibility and va'ue of the iron be mended. From the whole, an important lefion may be learucal of the pernicions efiects of water in the funace, and how abfolutely necellaty it is to prepare the cohes withom wing woter, either to damp the fres, as in the ufual mode, or to cool the cinders obtained from the the kilns, to prevent their conluming in the open air: in all this hurtful operation confiderable quantities of water become fised in the cokes, which require a very great degree of heat to expel.
" The preparation of iron fone has already been fully attended to, and the phemomena which it exhibits under every ftage mimutely deforibed. In conlequence of various experiments we are authorited to draw the following conclufions: '1hat when pure calcareous iron-itone is ufed, it admits of having the

Different kind of sron-ftone iequire dil ferent proportions of sokes. local quantities of cokes diminithed; that argillaceous requires a larger portion that the calcareous genus; and that filicecus iron-fone require a greater proportion of fuel then any varicty of the fomer generia. We have alto feen that fulibility, cither conncted with flrength or otherwile, is derived from the miture of the ores; and that escefive bittlened, intimately comected with in fubbility, is alfo derived from the fame fource. Irom a rovict of thete fict: we are forcibly imprefled with the importance of combining the prepared iron-stoacs with proportions of fuel fuited to thic various nature, in order to produce all the varieties of inon with the greateit polible economy. Contemplating farther the iame fubject, it i eady to be conceised that a want of howledge of the component parts of iron-itones, and the effects which individually they produce, matt lead to great
 nhercin the beratitul amonsy of matare, ans even reat property, will we often unproitally hacmatiod is Itecedent.

 in samous quantition in the ore as : then it re overlooked in propurtioning the coks is the soo. flone. I his powertul ogent, whote form ond tuthem. " conilantly eludes our vilion ; whofe anitene in wa aliertanined by the wonderiul changes pradaced by it various combinations with the iron; and whole prefone in the fame iton fone, in various ganaticic, may produce fuch variety of refult as to characterite the ore, as containing good or bud! iron, furcly furms the molt interetling misture which otes or iron-flones politi. It will be a momentous epoch in the manufacture of iron when the exiftence of lurh a puinciple thall tee fully admitted by the manufacturer, and its a, erac?, from certain vitible effeets produced, adopted to cyinm it, accompanying phenomena. 'lill that peried he will nut perceive the utility of afcertaining the quantity of oxygen, and deviting conomical methods of thhins it from the ore. An attention to this pewerful principle can alone root out thole prejutices in inimical to the real interefts of the manutacturer, and which feem to glance at nature, as having improvidently combined her molt ufeful metal with mixtures which could refil the ingenuity of man, or fet his comprehenfive intellect at defiance. In the progrels of this great inquiry, in it not pollible that the prefent expenfive exertions may in part be fuperfeded? Is it not poflible, that, by laying open the fources of information to individuals at harge, a greater mals of intellect may engage in the proficer of this art? While the prefent estenfive and lofty buildings are neceflary, the bulinels is entinely conined in the hands of men of great capital: the event os their manufactures require that a large tract of country be devoted to their fupply; a natural confequence $i$. that innumerable tracts of land are overlooked, or held unworthy of notice, merely becaufe they cannot, in a period neceflary to clear a great capital and infare a ortune, afford the neceflary fupply of materials. Such lituations, according to the prefent ftate of the irct butnefs, mult remain unexplored. Should, however. a defire for truth once gain footing in the manactories of iron, and thould this natural impulie of the unprejudiced mind keep pace with other branchen of intillectual information, we may mot defpair of feeing man:s impericetions removed, which nere the unavoidabic confequence of the period of their creation.
"In the application of iron-itone in the blaft furnace, the following particulars ought rigoroully to be attended to :-

[^6]
## $\overrightarrow{\mathrm{F}} \mathrm{U}$ R $\left[\begin{array}{lll}232\end{array}\right] \quad \mathrm{F} \quad \mathrm{U} \quad \mathrm{R}$

Furne $1^{\text {s chan }}$ that liceous iron-tones ought to be uted; not that they contain a serater guntity of iron, b.: Serfac tivy furm a fubftitute for the other hinds, a moy be an ve adantige wily fmelta for the pro Ranint of more valuele gellitu.

2 . Tecguantity of hental which each individurl iron-ione may con in, is monthe object of conderation. Et fres the profertion ot mixtures, which chietly con:rioute to ithe fability of ion-mtones, a fecond degree of fulibility in fepostent upen the richand of the ore in iron, thin is so obrious in the ute of the Cumberind and Inamahire ores, that the contequences of their intrcductina will be ferceived, by the change of the iceris an metl, in laif the time that change would be cfferd Ly ordinary iron-llones. It has been frequentty nutice ${ }^{j}$, that armle iron contaned pure carbone in isonortion to its fultitisy, then tle mone fuible of fufracabonated qualities mult take up, comparatively, a cosfiderabie portion of the carbonaceous principle from the fuel. From this refults a tribing coniequence, that the cuemtisy of faci lhuold, over and above its relation to the mistures, bear a juit proportion to the quantity of fun in the tone: for example, let the weight per
 Frel to be be fa, vied falicienty to fule und carlonate the iron In t- $t$ - conatied in $36=1 \mathrm{~b}$. of iron-thon, let the quantity of metal be fuppr fed 3 s per cent. then the produce will be 1261b. Showh a chonse take phace, and iron flone richer in irom be antied, though the hame by weight, and hould this iron tone : :eld of torrefied hone 45 per sent. its preduce will te $\mathbf{1 6 2 ! b}$. or 401 h . more than the tamer. A, there evits no greater proportion of cartute in the furnace, it is evident that the exiling quantit $;$, being difrituted crer meaty one-third of mose nue..., nuft therefore be in mare paring quantity in the whie, and the whue of the metal confequently rec.uced.
" 3. The weight of oiygen contained in iron fones - the newt object of hious contideration. I have alteajy flewn, from experiment, that our iron fones nai..rally contain from 9 to $1+$ per cont. of oxygen, which remain, aiter torafaction; it has alfo heen thew, that ahis riuntity of hutiful misture may be cafly doubled by over-roalling or mader-roating the flone; and that the bad fficeis entailed are in the ratio of its combint$\therefore$ on with the iron. From a ratiow of the facts Which have been adduced on this fubiect, its agency and eficets will cafily be credited by men of fcience; its pronerty of conilinti y the acidifying bafe of an the acids readily exphits the umalienable confequence of its pretence with oudinathe bales. The effects are still more pornicious when the oxveen is furnihed by the decompertion of water in raw iron lane; the hydongen in this cafe let fre, allo fizes a portion of the arbone; and the fe abitractions, united to that produced by the mative portion of ousgen in the fone, form an ...rigterte which frefremily reduces the value of iron 4 per cent. So long as the priticiples of feience are overtooled ia the manipulations of the foundery and Forge, the csillence of fich argents will be treated as dinoses of the philsfopher and chemit, and the effects rourly produced by then indultrioully attributed to

- Fol: calic :inch, in point of unity or comalency, will not

Mag. : oin, be.r the llightelt touch of in: enigation."*
In: comprelfon, velucity, and aflest of the air ate
of the utaol? in: notance in blaft fumace. Th: prodution, mona cment, itid direction of thele effects are therefose ferion obicts of conideration to the manufactarer of iron, hace on the ir proper application the fieceets of his opeation cheefly depends. And here we Chen renew ou: obligations to Mr Mumet for his is tereltag oblervations on this fubje.t. "When it is conlidefed." he fiys, " that in the fmelti:g operation the reduction of immonfe quantities of materials is etfected by it compmened current of air impell-d by the whole potwer of a bowing machine, the conieruences 0 : He change of air. cither in quantity or quality, mult be very obvious: when, father, we contemplate the metal called into exiftence by means of combution thus excited; when we confider iron as haing the molt ponerful atwity for the bafe of that part of the air which mantains combution: and when we view the debafed ftate to which the metal is reduced by coming into improper contact with it, we mat conclude, that the application of blaft in the mandacturing of iro: calls for the moft minute and thorough inveltigation. In order to take a comprelienfive view of this lubject, the following divifion will be requifite :-
" 1 it, The intimate comection which the quantiy of blaft bears to the area of the internal cavity of the furnace, and to the rature of the pit-coal.
" 2t, 'The vacious modes by which air is procured, and how the ee refectively affect the quality of the air.
" 3 d , The various changes to which air is fubjected by a change of temperature in the atmofphere, with the confequent effects.
" th $^{\text {th }, ~ H o w ~ f a r ~ i n c r e a f e d ~ o r ~ d i m i n i h h e d ~ v e l o c i t y ~ a n d ~}$ compreflion alter the refults of the furnace.
" 5 th, The form and diameter of the difcharginglipe.
" ilt, Then, in the conftruction of a blaft-furnace and Cuantity blowing-machine, the quantity of air to be ufed ought of ar reguto depend upon the intemal dimenfions of the former; ; the conwhich, again, ought to be formed according to the itruenon or quality of the pit-coal. Upon the foftnefs or hardnefs the furof the coal, ought more immediately to depend the nace; and heisht of the blall-furnace. This neceffary precaution this depends has given rife to a valt variety of furnaces, of different ture of the capacitics, from 30 to 50 feet in height, and from nine coal. to 16 feet diameter at the bothes. Furnaces from 30 to 36 fcet are ufed for the fofter qualities of coal, fuch as a mixture of free-coal and fplint. Furnaces from $3^{6}$ to 45 are appropriated to the burning of fplint-coal cokes; and in Wales, fuch is the fuperior itrength and quality of the pit-coal, that the furnaces admit of bcing reared to the height of 50 feet.
" Thele various qualities of coal, it has been formerly hewn, have appropriate weights of iron-tione, and, to ute the language of the manufactory, are capable " of fupporting a greater or lefs burden of minc." The former qualities admit not of having the air difcharged in great quantity, unlefs it is impelled under an uncommon degrice of comprefion and confequent velocity incompatible with the operations of a feam-engine. The reafon is obvious: when air, loolely comprefted, or comparatively fo, is thrown into a będy of ignited fuel, the mechanical itruchure and continuity of whole particles are foft, the air is much more eafily decompofed; the ignition, of courle, is more rapid: the defcent of the materials is promoted beyond their proper ratio, and

## F U R $\quad[293 j$ b U R

$\underbrace{\text { Fin: }}$ long before the carbonaceous matter has penetrated the ore, or united to the metal, to conititute fubibility. I thall adduce an example, as being the moll illuilrative of this doctrine.
"Suppote a blat furnace, 35 feet high, it wide at
 the air is imitatancutily alected $u$ on it entering the -
 the oxyenen that is Ahonghed; atd tow vii quatity of caloric lit fice, is contopucece of it uni 11 with the iron and catbene, woluce the atmentiny lee t now ritible, lut which iumar') height in the furtac:
"From this it whll an: r, that athough a greater ap parent degree of leat i, wifbly pudtaced by the fud len decomplition of the ail, and amore ratu cuicut of materials for fonce time is tie conerutance, yet, as the quality of the iron is impared, and is in the end the furnace will roturn to ita old colfumption af matertais, as to quantity, the effects of a loule furs blaft are ob. sioudy pernicious.
"It fometimes happens, that when a locere blaft is fur-Pern ar, charged with a condiderable fortion of moiture, or ${ }^{-5,4, t a f}$ cumes in contact with cokes which had been wat when the or introduced into the furnace, the inthammation which toret takes place at the tuyere in prodigious: fine fire chay will be melted dowsi and Llown to hag in a few minutes; the fides of the furnace, compoied of very infufible fire itone, is next nttacked, and in a few hours will be fo cumpletely deltroyed as to flop the workiner, and require immediate repair. Effects timilar to thole now delcribed will be felt when blatt is improperly jroportioned to coal of a itronger continuity of fracture and fuperior quality. Beindes the effects produced ty the fudden decompolition of iron, others of like nature are produced where a foft coal is ded, a finall furnace, and a great difcharge of blatt.
"It has been found that crude iron, to be properly matured, ourht to remain in the blafl furnace, according to circumblances, 48 to 62 hours; th.t is, from the period that the iron flone is introduced till fuch time as the notal begins to occupy its place in the barth in a flate of pe fect feparation. When the contraty is the cafe, the mistures arrive at the hottell parts of the furnace before the metal has taken up a fullicient quantity of carbone from the fucl ; the action of the blat, and the immediate heat by which the ore is furrcunded, forces the iton from its comnctions to the buttom of the furnace. The quality is de-carbonated, and reduced in its value: to rellore this again, the local portion of fuel is increafed ; chis adds to the expence of manuficturing, and diminithe, in fome meafure, the fmelting of the fürace.
" When fulint-coal cokes ate $u^{\prime}$ (d in the blatt furnace, the blaft admits of being thrown in under the highelt pof lible pitch of compreflion; the uncommon denvity of the charcoal fulains a very powerful difcharge of blat before it is dilhrated to facilitate the general defoent. Molt frequenty, large mafles of thele cinders pais through the whole ignited cavity, and are throwis cut beluw, polfoling all the acutenelo of their originat form and fraclure.
"This puaity of coal is ured in all the Curfon blat? furnaces, where, to cnfure a reljectable produce, the air is difchased under a preture equal to $3 \frac{1}{9}$ pound upon the fquare inch, or 61 inches of mercury.

Furrace.

"The fame quality of coal was uffd at the Devon iron works, where at one time, having all the blat of a $4^{8}$ inch cylinder enginc thrown into one furnace, the column of mercury fupported w:s upwards of feven inches; the quantity of air difcharged under fuch an impelling power, I found to exceed 2600 cubical fect ter minute.
"The coals uied at the Clugh, Cleland, and Clyde iron works, are nearly of the lume quality at each-a misture of fplint and loft coal. The Muirkirk and Glenbuck iron works have a coal different from any of the former, and in fome particular fots it confiderably refembles the Eng'in clod coal.

Tetheds of risetung arr wato the zurnace,

Ey cylinders and witer blowing machines ;

By mears of the wa ter fault.
" 2d, The various methods of procuring air for the blatt furnace may be reduced to the following: - Iit, That procured by cylinlere, and difcharged into the furnace by means of a tloating fition heavily loaded, and working in a large receiver or regulating cylinder: 2d, That wherein punping cylinders only are uled, and the air thrown into chelts inverted in water, called the water vault: 3d, that mode wherein the air is difcharged from the pumping or forcing cyliader into an air tight house, called the air somit.
"The firlt method is the original mode of blowing, and is titl mach uled at thole iron works whofe erection has been prior to the laft ffteen years. By this mocie the quality of the air is lefs fuljeat to alteration by a change of atmofpere. The principalobjection to this manner of blowing, is the want of capacity in the receiving cylinder ; which canot be increated fo much as to take away the confiderable intervals which occur at different parts of the engine ftroke. This effect is fenfibly feen by tife fieedy and irregular afcent and deficent of the colurn of nercury. In water blowing mochines, where the air is raifed by three or four cylinCers worked by means of a crank, and where the air is rcceived into an air cheft, and forced into the furnace by the continual action of the blaft of each fuccetfive cyliader, the current of the air is Iteady, and fupports the column of mercury with great uniformity.
"The ufe of the water vault has of late years become very general among new erected works. Its properties are, a iteady and very cold blaft: the largenefs of the receiving cilterns gives them a fufficient capacity to retain every pound of air raifed by the furnace, and diltribute it to the greatelt advantage. This is not the cale with the floating pifons, where a certain quantity o: fpare wind is thrown out at every return of the engine, lett the great fition and weight fhould be blown out of the cylinder altogether; which, indeed, fometimes happens. The only objection which remains in sorce againit the ufe of the water-vault, is the tendency which the air has to tithe up a confiderable portion of water in lolution, and introduce it into the furnace. A jndicious arrangement of the conducting pipes would in lume meafure obviate thie, at well as the more dangerous tendency which water has to rife in a pipe focedily emptied of its air by the fopping of the engine: a Itream of water thus conveyed to the furnace, would ke productive of the molt awful confequences.
"The air afforded by the air vault is much inferior to
are unavoidable in underground excavations, and conveys them to the furnace. The blatt is, however, Iteady and uniform; and when the infide of the building is completely lecured againtt the paffage of air, it is productive of conitderable effects in the furnace. In the fummer months, however, the air becomes fo far debafed as to affect the quality of the iron, and change it from gray to white. Every change in the temperature of the atmofphere during this period, is indicated by various changes in the furnace.
" The largeft air-vault hitherto in ufe was excavated out of folid rock at the Devon iron works : the fiffures of the rock admitted conliderable quantities of water; and the fame degree of damp would always prevent the pombility of making the fide walls and rocf air-tight by means of pitch and paper, \&c.
" Bedides the various natures of blait, as to the Q ality ftrength and equality of the current afforded by dif-and ftate of ferent modes of conftructing the bluwing machines, $a_{\text {the air con- }}$ variety in the quality of the air obtained is alfo an invariable confequence : thi, is fullicientio known by the effects which it produces in the blatl fronace, and ought to be fubject to firupulous examination.
" In this, as in other countries, larger produces of calt iron are obtained in the winter months than during the fummer and autumn featons: the quality of the metal is affo much more carbonated, and with a lefs proportion of fuel. In many parts of Siseden, where the lummer heats are intenfe, the manufacturer is obliged to blow out or ftop his furnace for two or three months: not only is he mable to make carbonated metal, but is frequently incapable of keeping the furnace in fuch trim as to make a produce of any quality whatever. In Britain, during the months of June, July, and Auguft, more efpecially in dry feafons, the quality of the iron, with the local proportion of fuel, will be depreciated $3 \circ$ per cent, and the quantity reduced to two-thirds or three fourths.
"In feeking for a folution of this univerfally acknowledged fact, our attention is naturally directed to an examination of the various flates of air. That the quality of the air in winter is more fit for combution than in fummer, is a truth which requires no farther d monftration. Greater coolnefs, whereby an almoft complete refrigeration of moifture takes place, and the prefence of perhaps a greater relative proportion of oxygen, may account for this phenomenon. On the contrary, he quality of air during the fummer months becomes much contaminated for combuftion, by holding in folution a much greater quantity of moilfure: the abundance of nitrous particles may alfo diminith the utual proportion of oxygen.
" This will account for the inferior effects of combuttion both in common fires and in the blatt furnace; it will alfo in a great meafure tend to folve the corious phenomenon of the pig-iron taking up lefs carbone in fummer, although reduced with a fuperior quantity of fuel. The air difcharged moit probably contains lefs oxygen; yet the metal is much leis carbonated than at other times, when contrary proportions of thefe exitt. Moft probably the deficient carbone is carried off by diffolving in hydrogen, forming a contlant tream of hydro-carbonic gas, while the oxygen that is fet free unites to the iron; and while it reduces its quality, at

＂The moil inferion quality of air ufed in the blatp－anet
 experfed from thence by its own cialticity and the hitr etlive flrokes of the engine．The capreity of tur he I uilding is from 62 to $-0,000$ cubical leet；this，whe： filled，generates a much fiperior degree of heat to that fenfible in the blorsing eylinder．As this heat is prus daced many feet difant from any mechanical motion it is moll evident that it is extricata！from the air，ast will readily mite with the millure which penctrates the builling：the quality of the air introduced into the furnace will therefore he in proportion to the quatity of moiture taken up；this will be much more in fum－ mer than in winter，as the temperature of the furmer exceeds that of the latter．The fewfation，on entering the air vault in the coldett months，immediately after ftopping the engine，is exactly limilar to that experi－ enced upon entering a crowded room in the hottelt fum－ mer day；the walls are covered with damp，and the fin－ perior regions of the vault readily obfcure the flame of a candle．The fecling，unon remaning in the sir vauit when the engine is at work，is lefs marked than would be expected where fo great a compretion of air exilted； the lenfe of hearing，owing to the moilture in the con－ ducting mediun，is confiderably impaired，and refij－ ration is performed with fome difictly；the lis he if a candle is faint，and not vilible at the diftance of 2 ferv feet．
＂I have explained the n＂cefity of jut proportions evilling betwixt the area of the interior of the blant fur－ nace，the quantity of air throsn per minute，and the quality of coal．The various motes of blowing，and their refpective effeets，deluced from larict objervation， were allo attended to．We have now， 3 d，to addure examples，where the various changes of the stan，pher， as to heat and prelfure，occafion the mot feanible di－ ference in the quantity of materials confunc $l$ ，add in the quality and iuantity of metal produced．
＂It has been already demontrated，that the air in winter，b containing lefs moiltue，is mose proper for： combuthion，and more calculated to produce cartonnend crude iron，than the air exiting at any other feation． From this fuperior quality the manufact arer obe sian ad． vantages，which induce him to with for a continames

[^8]at wol .un thaughout the whote yen. Thefe eflicts ure not, however, unitom: they depend grently unca Whit or teavy atmotphere. The keener and mite thil the air, the more ranid the combution. During a tevele frot, the defcent of the naterials is facilitated from one-tenth to oue-fittecnth more than in rainy or hazy weather, and at the fame time the quality of the iron is Wher improved than impaired. Wren a change from frest to fnow or rain takes place, the effects frequently tecome aimoft inmediately obvious; the colour of the timene at the furnace head is changed ; the tuyere of the furnace indame:, and bums with great vioience; the lava, as it llows from the notch of the dam tone, becomes lengthened and tenacions; the form of it is chanced, and the colour undergoes the moft viifible alterations; the iron no longer retains its complete faturation of carhone, but hows out fenfibly impaired of its fulidity; and, when cold, the privation of carbone is mol 1 evilent by the examination of its fracture.
"When fuch confequences arife from the tranfition fo frequent in winter from frolt to thaw, it will be eafily conceivel that the change effected during the milder and warmer months muft produce proportionally additional effects. The increafe of temperature by taking ap, and holding in folution, a much greater portion of aqueous vapour, will account for the ordinary effects which are annually obfervable in every work. Where theie pernicious confequences approach to extremity, a folution of the phenomenon will likely be obt ined by the examination of the blowing apparatus. If air is fitted for combuftion in proportion as it is free from watery folutions, we are not to expect fimilar refults from thefe blalt furnaces in fummer, which are blown by air from the regulating cylinder, and thofe blown by air fron a water or air valult. I have for years feen this fat verified, and fuperior quantity and quality of iron during the hot weather, obtained from a furnace excitcd by means of blaft, from the fimple regulating cylinder, with a lefs proportion of fucl than from furnaces whofe air was exprefied by means of the water or air vault. Obfervations thus made, where every day the effects of the different means could be jufly eftimated and compared, have led me to the following conclu-

Airfinm
selimucr sirefereed. fion: That the quality of the air, as furnithed us by nature in our atmofphere, is unilormly more fit for the manufacture of crude iron to profitable account, when ditcharged limply by means of cylinders and piftons, than when brought into contact with moillure either in the water vault or air vault.
"So inperfect has the quality of the fummer air been found in this country for combuftion, where the water vault was ufed, that experiments have been made to repair the deficiency of effeet by introduring lteam into the furnace by means of an aperture abore the tuyere. The inducing motive to this act, was a belief, that combuftion was diminifhed in confequence of a diminution of oxygen gas during the fummer ; that, by introlucing water upon a furface of interials ignited to whis: aef, decompofition would enfue, a larzer quantity of oyy zen would then be prefented to the fuel, amd fuperior effects, as to combuffion, obtained in this manner than hitherto, witnefled. The idra was ingenioti, nucl, in its application to the monfaclure of caft iron, ong,inal; lut the whole train of fote, which have

quantity of exgec: w, was overlooked. The event pro- Furares. ided in the moth complete manner, and on a great fcaie, the pernicious elfects of moiture. The furnace gradually became cooled where the ftcam entered; the hest, fet free by the decompofition of the water and the ditengagement of oxysen, increafed to an alarming pitch a confiderable way up the furnace; the quality of the iron became brittle, and as white in the fracture as lilver; the introdusion of the fleam was fith continute the defcending materials were inftantly robbed of their he to to facilizate the decompofition of the water, and by and I $y$ the furnace clofed entirely over, and the expcrinent ceafed.
"This experiment, performed in a furnace 18 fect high, is a complete proof that l.eat is dilengaged from bodies while they pafs from the fluid to the aeriform Itate. The firit inftant of the difcharge of theam, a very confiderable portion of heat would be withdrann from the fuing materials and united to the water. This, in its turn, would be igniied to whitenefs, and decompofed apon the metals and cokes, in a fuperior region of the furnace. The procefs continuing for feveral hours, the materials at the tuyere were at laff fo completely deprived of the caloric by the continual torrent of Ateam, that they loft fluidity, cooled rapidly, and at lalt became black. Had another aperture for ileam and for air been opened above thefe, now entirely thut up by the confolidated materials, the fame effects would have been produced ; the immenfe quantity of caloric, difengaged by the decompoftion of the ignited water, would now approach nearer to the top of the furnace, another ffratum of fufing materials would again become confolidated, till in the end the whole furnace would be fet falt from top to bottom. From the introduction of fleam into the blaf furnace, either as fuch, or under a fuperior degree of expanfive force, the following important truths may be leamed: That the quantity of oxygen which enters into our atmofpheric compound is generally mure fit for the manufacture of the fuperior qualities of crude iron than any misture which may be furnifhed by the addition of water: that, although the decompofition of water, by furnihing a fuperior quantity of owsen, and by throwing of a relative proportion of caloric, increafes the efiect of combuttion immediatily in the vicinity of this chemical analy fis ; yet, as the water had previoully abitiacted the heat necellary to its decompolition from the inferior itrata, a greater quantity by no means exints in the furnace. The water, in fact, only ferves as a medium to convey the heat from one pirticular fpot; but, by attempting to tlv oft with it, meets decompolition, and renders up not only the abtracted heat, but that which was contained in the osygen of its decompolition.
"i ${ }^{\text {th }}$, The compreflina and velocity of the air dif. Comprefcharged into the furnace, confiderably affect the refults lion and of the fruelting operations. In the contideration of this the airty of confubjeat, the various cqualities of coals will be found to the ared. have an intimate cormexion with the area of the difcharging pipe and the compreftion of the blath. It has aleady teen mose than once offerved, that a foft or mined quali'y of coal is more tutceptible of combution than either the finlint or clud coal: the conle uence of this is, that, untels the :eeseliry compreflion of ar is ufed, decompofition is too eazly accomplifhed, and the cuke. Lecume oxygnaled by cembution in a greater

 air being thrown mon rokes catily conturible, the quatity of the metal, with the tane 'l many of fucl. becones oxygenated, the tuyere becomes fiery, and trequentiy emits fuarks of metallir ove le. The leparating iron may be viewed as it onves from the ore in finntil globular mafles, frequently on fire, changing its fate to that of an oyde. The combintion of oxysen, by aitering its denlity, make, it fulject to the re-action of the blat, which at times gives it a direction from the tuyere with confideable vic!ence. Thote parts of the ron (by far the givatell) thus oxydated, which elcape not at the tuyere, mix along with the futed earths of the ores and limetone, aiter their colour, and frow from she funace more umevived than at their firl intwidetion. It is, however, very different, even with this infeior quality of coal, whete the denfity of the blat is proportioned to the iuflammability of the livel. Suthities and quatitics of cruble iren nay be produced fron this, equal to thote from coals reckoned of a fuperior nature. The metal becomes a; hishly faturated with carbonic principle at that made fion ( lod or fphint coal. The tuyere erinces that decomporition is effected in its proper place. The fludi matie, of iron, as they become expreted from the ore, are hivered into fpry, betore the denfe column of air, whitout whibiting the lealt fymptom of decompofition. They again unite under the level of the blaf, increale in lize, and fink throuth the fluid fratum of earth to the bottom of the furnace. This fact holds out one of the thongcit proofs of the great affinity which carbone and iron mutually polifs towards each other. In the cafe of the iron leparating in an oxygenated ftate dellitute of carbone, it imnediately falls a prey to its affinity for oxygen. In the latter cafe, the iron, being completely carbonated, refilts decompontion by the facifice of a very lmall portion of its carbone. It further proves, that the affinity of oxygen is greater to caroone than to iron; and that, before iron becomes osydated, all the carbone is taken up.
"The continuity of the particles of fplint coals renders the cokes of dificult combuftion, capable of with:itanding a mof powerful difcharge of air, in quantity and in the degree of comprelfion, without entailing efEcts fimilar to thofe produced with the ule of finter coals: this renders the operations with fplint coal lels fubiect to cafualty and to change. Carbomated iron with a proper blat is more uniformly obtained, and ireçuently a very fuperior quantity. Similar eflects are produced with the clod coal, but in a more eminent degree. Difcharging pipes are ufed four inches in the di.metre, and the compretfion only equal to two pounds. on the fquare inch; yet the fame fatal effects are not known as in the ufe of foft coal, which, with fuch a co?umn of air, would require the preflure to be equal to three pound and a half upon the fquare inch at leatt.
" $3 t h$, Uros the form and contruction of the dit.

 l:own: $\%$ : $\quad$ :

- Ho matatiad yruperly the vificationathe pars of the contruction of note pipes, it mult be sernlie:tel. that much has been lind to depentupon the biati reacinins the oppoite extremity of the furnace, as littie in paired of the compactnets and velocity of its oniginal difcharge as polithe. When it is otherwie, the relult it the internal operations of the fernace nul be conic quentiy altered. If the compreflion is diminithed one half or two-thirds when it reaches the oppolite wall, decomyontion in that portion mull be effected betore the air has attained its elevated fituation in the furnace. It is tien poffibie to diperfe the whole column of air in fuch a manner that the ignited materials of the opponte fide may receive little of its effects to promote comLallion.
" I difharging pipe is frequently wfed, in length 12 inches or more, the difharging apertuse 3 inches, the other end $s$ inches; but this is arbitrary, depending upon the fize of the adjoining pipe. From a pipe thus conflructed, the air difperles or diverges too fuddenly ; and at a fmall dithance from the orifice, a contilemble portion of it anfwers but imperlectly the purpufes of combuttion. Part of it is Speedily decompoled, and the oxygen brought into immediate contact with the iron. The quantity of metal is reduced by the formor, and the quality injured by the later. Though long cullom, by a continued ufe of fuch haped pipes, tha presented their pernicious efeats from being obterved, yet they mult prove in many cafes detrimental to the economical diftribution of air, and the manufacture çiron.
* A nofe pipe, of another conflruction, even more exceptionable, is allo wed, and the air difperles dill more fuddenly, in a degree fomewhat proportionate to the more fudden contraction of the pipe, a confiderable quantity never enters the furnace, but, atriking on the exteiior wall, is thence repelled.
" I difcharging pipe of the following contruction, Beit iem wotid ubwiate, in a great mealure, the imperfocions of :coutt the two former: the length of the tapered piece is 121 on . incher, of the ftras he pipe, is incles; extreme diame. ter, as in the others, five incles; chameter of itrais: pipe, three inches. From fich a pipe it is conceived that the blat will freced to the greatell polible diftance unimpaired in comprefion ard velocity. So tr, therefore, as the abolute force of the blat , med brewish of the furnace will permit, decomp fition will !e preverated on the level of the pipe, and the manamictare: freed from the evil? which I hav above det riked, as attemdant upon deconnefition in that quarter."

The following is a defcription, who t.hen from MrD.! fe: in Mahet, of an air and a water valut which is employed ${ }^{\text {".t. .a. ar }}$, to coqualize the difcharge of air into a blast farnace. vaus

An account of fome curions phenomena obferved by singular Mr Roeluck in the air vault of a blaft furnace has been phenomena publiihed in the $g^{5}$ th volume of the Tranfactions of the obicrved in Ruyal Society of Edinburgh. This, as well as fome an air remarhs of practical utility on the management of blaft furnaces, we doubt not, will be intereiling to our realers. We thall therefore give it in his own words. It is addicifid in the form of a letter to Sir James Hal
"I have (fays le) examined my memorandums, concerning the obfervations I made on the condenfed air in the air vault of the Devon iron works, near Alloa, on the north fide of the sith of Forth; and, according to your requeth, I now tranfmit you an account of them; and alfo of an experiment I made, when a part. ner and manager of thefe works, in order to increde the produce of blatt funaces.

The two blatt furnaces at Devon are of large dimenfions, each being 44 feet high, and about 13 feet wide in the bollies, or widett part, and are formed on a fleep bank, by two'pits funk in a very folid itratum of coarfegrained freettone.

Thefe pits were afterwards fhaped and lined in the ufual manner of blaft furnaces, with common bricks and fire bricks, and the hearth was laid with large blocks of the ftone that had been dug out, and which ferie the purpofe of fire flones. At the back of the two furnaces, next the bank, the air vault is excavated, and formed by a mine driven in the folid rock, ditfant from the furnaces abont is feet. The bottom of the air vault is only about four feet higher than the level of the bottom of the furnaces. This vault has an aperture at one end to reccive the air from the blowing machine, and has two at the oppofite end, one of which receives the eduction pipe, and the other is a door to give admittance occafionally into the vault. As the rock is extremely clofe and folid, the rault is dry, except that a little water oozes very gently from the fide next the bank in fmall drops, and does not appear to exceed an Englith pint in 24 hours.

Thele furnaces are provided with air, or blaft, as it is tcrmed, by the means of a fire-engine of the old, or Newcomen's conftruction. The diameter of the fteam cylinder is $48 \frac{3}{4}$ inches; and the fquare arca of its piton being about $1866 \frac{1}{2}$ fquare inches, the power of this fort of engine cannot be rated at more than 7 lb . to the fquare inch, amounting in all to about 13062 lb . This power was employed to work an air pump, or blowing cylinder, of 78 inches diameter, and about feven feet long. The number of fquare inches on the piton of the air pump is 4778 , and therefore this area, being multiplied by $2 \frac{3}{4}$, will produce 13139 , being a reniftance that nearly balances the above-rated power, and fhows that the iir, which was expelled from the air pump, could not be condenfed more in the ordinary

## F U R <br> 289 ] U R.

## Furnace.

 $\xrightarrow{-}$ way of working, than with a comprefling power of about $2 \frac{1}{f} \mathrm{lb}$. on each fquare inch. As the engine was not regulated, at arlt, to make a longer ilroke than about four fiet eiglt inches, only one furrace being wed, the quantity of air expelled at each troke of the machine was about 155 cubic fect, which it difeherged through a valve into the air vault, about 16 times in a minute. When two furnaces afterwards were blown, the engine was regulated to work much quicker, andDimenfions
$\alpha$ the ar
"upit. with a longet ftroke. The air vault is 72 feet long, $I_{4}$ feet wide, and 13 feet high; and contains upwards of 13,000 cubic feet, or above 80 times the contents of the air pamp. The top, fides, and bottom of this vault, where the lealt fiflure could be difcovered in the beds of the rock, were carefully caulked with oakum, and afterwards plattered, and then covered with pitch and raper. The intention of blowing into the vault is to equalize the blatt, or render it uniform, which it effects more completely than any machinery ever yet contrived for the fame purpofe. The air is conducted from the vault by the eduction pipe, of 16 inche, diameter, into an iron box or wind cheft, and from this it goes off to each furnace, in two fmaller pipes that terminate in nozles, or blow-pipes, of only $2 \frac{1}{2}$ to $3 \frac{3}{4}$ inch diameter, at the tuyere of the furnace.
Trial of the "When the furnace was put in blaft, after having furnace fails. been fllled with coakes, and gently heated for more than fix weeks, the keepers allowed it to have but little blaft at firt, giving it a fmall blow-pipe of about $2 \frac{1}{7}$ inch diameter, and likewife letting off a very confideralle quantity of air, at the efcape or fafety valve on the top of the iron wind cheft, as it is a received though erroneous opinion among them, that the blait muft be ket on very gradually for feveral months. From the conftruction of this valve, it was impoffible to alcertain the exact proportion of the blaft which was thus loft, but I believe it was very confiderable. The confequence was, that the furnace, after it had been in blait for feveral days, never feemed to arrive at its proper degree of heat, but was always black and cold about the tuyere in the hearth, and appeared in danger of choking, or gobbing, as it is termed.
"After various experiments tried in vain, by the keepers and the company's ergineer, and others, (indeed they tried every thing, except giving the furnace a greater quantity of air, which, as I afterwards afcersained, was all that it wanted), they concluded, that the air valt was the caufe of the whole mifchief; and, to confirm their opinion, they faid they bad now diff covered that water was, in confulerable gunntities, driven out of the air vault through the blow-pipe, which cooled the furnace; and they inilited, that the power of the engine was fuch as to force water out of the folid rock; fo that this method of equalizing the blaft never would fucceed. The other managing partner was fo much alarmed by thefe reprefentations, that hic began to confult with the engineer, and others, about finding a fubftitute for the air viult at any expence.
The caufis "As the plan of the blowing apparatus had been gated.
mavefti- adopted at my reconmendation, and was now fo loudly condemned on account of the watter, I had other motives, than mere intereft, for trying to b come better acruainted with the phenomena attending it. I accordingly determined to go into the air $\because$ ult, and to reFive. IX. Part I.
 blowing the furnace. It is an experiment that pern never was made beforn, as there to y o wited foch an:
 other of the uperative people allunt the wotis, t, le 1 ? companions, as they inangined :hat there une mur h damger in the expriment. Ni: Neil k, rif, however. one of the denks of the Devon company, hat ald.at: : contidence in my reprelentations to vatate i.imhll a'o: with me.
"The macline had bern fopped about two Iotus Pher : . . . previous to our entering the vant, anl we tound a 1 dampneis and millimels in it , which difuppared foon atter the door was thot faft upon wo, and the engine pe fas began to work in its ufual manner. After four or tave a pront. Itrokes of the engine, we both experienced a dingulat wit no fenfation in our ears, as if they were Hopped by tioc fingers, which continued as long as we renamed in th. condenfed air. Our breathing was in t in the leat atfected. I had no thermometer with me, hut the ters. perature of the air felc to us the fame as that withor: the vault. Sound was much magnified, as we perccived. when we talked to each other, or truck anything: pat ticularly, the noile of the air cicaping at the biow-pipe. or watie-valve, was very luad, and feemed to rewar: back to us. There was no appearance of wind t. ditur's the Hame of our candles; on the contrary, I wa furprifed to find, that when we put one of them intu the eduction pipe, which conveys the wind from the vault to the furnaces, it was not blown out. Ther was not the fmallett appearance of any drons of wateiffaing out of this pipe. The ouzing and dropping of water from the fide of the rock, next the bask, feemet? tl : fame as before the condenlation was made in the vault. In thort, everything appeared, in other relpectis, the fame as when we were in the common atmofphere. Having remained about an hour in the condenfed air, and fatisfied ourfelves that no water, during that time, that we could in the leail difcover, was agitated and forced out of the rock and vault by the power of the blatt, as was imagined and infited on, ve gave the fignal to fop the engine. As foun as it ceated to work, and the condenfation abated, and before the door of the valult was unferewed, the whole vault, in a fen ficonds, became filled with a thick vapour, fo that we could hardly fee the candles at four or five yard ditance. The door ieing now opened, the work perple, ansious to know our dituation, and what had occore 1, came into the viult, and prevented any further ooternations.
" I now endeavoured to account for thi curious appearance of the water, which only thowed itfelt uscafionally, in very limall quanities, it the tuyere, at a hole 1 ordered to be made in the buttom of the wind chelt to cullect it more arcuratels, for it never was obferved, but cither when the engine, thet working flowly, was made to work quicker, or, after having been itopped for a few minete, was fot to work aypin.
" I confidered the vapuer which we hed dhtuvered the vapo.. in the vault to aile from the moillure of the lide of onerved ia the roch next the furnice, which being expelled by a wounted the grat lient of the furnace, and converted into va-1 f . pour, was able to force its nay through the pores of the rock into the vanht, but that being in a manner confined within the rock, by the preflure of the condenfed arr, it found itlelf at liberty to come into the o) \%aist.

## F U R [ 200 ] F U R

ra゙リact vant, only when the condenfation abnte ! confiderably, or uas totally renoved by the going llow, or ftopning of the engire, It allo cecurred to me, that the air, in a fate of condendation, migit ponibly be capable of lolding a greater quantity of noter in folution, which enight frecipitate fuddenly into vapour or mint when the condenfation abated. I imagined, therefore, that the very inall quatitios of water we at times difcovered, froceeded from nothing elfe but this Supent, in its falige to the furnace along with the llat, being condencd into water, by the coolnefs of the eduction pipe and iron wind cheit. The quantity of water did not appear to amount to a gallon in tuenty. fcur hour:
" A few days after I had made this experiment, the water ceafed eatircly to make its appearance, cither at the tuyerc, or at the hole in the wind cheft, an: the furnace did not come into heat for a long while ater, and indeed not till the keepers let much more air into it by a larger blow-pipe, and allowed lefs air to eficape at the fatety valve. It is probable that the roch was now becone perfectly dry by the continued lieat of the furnace.
" IIy experiment had the good effect to remove all :he Fryudices againf the plan I had adopted of blowing tie furnace, and likewife prevented the other parmer from laying out a large fum of money, by hopping the works, and altering the blowing machi.ery. Indeed, it has fince been adnitted, by all who have feen it at work, to be the moft fimple and effective method of equalizing the blatt which has yet been 1 ut in practice.

Wind
Estr"e np- $^{\circ}$ plied and is entents.
" This experiment led me, fome time afterwards, to apply a wind gange that I contrived, to afcertain precifely the fate of the condenfation of the air thrown into the furnaces. I found that a column of quickfilver was raifed five inches, and fometimes, though feldom, ix inches, and, in the interval of the engine to eceive air into the air pump, it fell only half of an inch. At this time only one furnace was worked. But when two furneces were in blalt, the engine only raifed the mercarial gage about four inches, becaufe the Devon company, for feveral reafons, did not, while I continaed a partner, think proper to allow the blowing marhinery to be completed, by putting to work their reond boiler of $2=$ fect diameter for the fire engine, scording to my original defirn, which, by adjufting the machinery, would have enabled us to blow two furnaces, with two boilers, with as much effect, in ireportion, as one furnace with one boiler. This instrument had the advantage of enabling the work neople to difcover the real power of their blaft, and know the exact condition of the air valves, and the searisg of the blowing piton; for if thele were not kight, and in order, (although the engine might, to appearance, be doing well, by making the fame number of dicharges of the air pump as ufual $\mathrm{p}^{\text {er }}$ minute), yet the wind gage would not rife fo high, and would thery that there was an imperfection fomewhere, by +wion of a quantity of air efeaping at the valves, or pinton, that could not fo cafly otherwife be known. This contrivassce was confidered as of much ufe, and was afterwards always quoted in the company's journal hooks, to thow the actual ilate of the blowing machine, ti. comparins the daily produce of the furnaces.
" I hepe jou will not think me tedious, when I Furnace. explain to you another experiment, which appears to me to lie of coniderable importance to all manufacturers of call in mo.
" I had reafon to conjccture, from my own obfervations on the effects of blowing machincry on blaft firnaces, as well as from the knowledge I had acquired from my father Dr Ruebuck, and from my communications with other experienced iron malters, that a great part of the power of fuch machinery was mifapplied in general practice, by throwing air into furnaces with much greater velocity than necellary, The veloand that, if this velocity was, to a certain degree di-city of the minifhed, the fame power, by properly adjufting the blaft, blowing machinery, of whatever nature, would be capable of throwing into the furnace a proportionally greater quantity of air. For, Since the quantities of any fluid, iffing through the fame aperture, are as the fquare roots of the pre/fire; it follows, that it would require four times the preflure, or power, to expel double the quantity of air, through the fame aperture, in the fame time; but if the area of the aperture was doubled, then the quantity of air expelled by the fame Fower, and in the fame time, would be increafed in the ratio of the fquare root of 2 to 1 , though its velocity would be diminifhed exactly in the fame proportion. Again: I confidered that the quantity and intenfity of heat, produced in blaft furnaces, and confe. quently its effects in increafing the produce, might be only in profortion to the quantity of air decompofed in the procefs of combuftion, withont regard to its greater velocity; that is to fay, whether or not the fame quantity of air was forced, in the fame time, into the furnace through a fmall pipe, or through one of larger dimenfions; for, in attending to the procefs of a common air furnace for remelting of iron, where there is a very large quantity of air admitted through the large areas between the bars, it is well known, that a much greater intenfity of heat is produced than takes place in a blait furnace; and yet the air does not enter into the fire through the bars with increafed denfity or great velocity. I therefore thought it probable, that increafing the quantity of air thrown into the blaft furnace in a confiderable degree, although the valacity or ind its denfity might be much lefs, would bave the effect of in guantity creafing its heat, and operations, and produce. And conficered, as, from the principles above flated, with regard to the machinery, I faw I could greatly increafe the quantity of air thrown into the furnace, by enlarging the diameter of the blow-pipe, and regulating the engine accordingly, without being obliged to employ more power, I was anxious to make this experiment.
" A fyitem of management, of which I did by no means approve, was adopted by the other partners of the Devon company, foon after the works were begun to be crected ; and, in the profecution of it, they ordered their fecond furnace to be put in blaft, without permitting thofe meafures to be taken that were neceffary to provide and maintain a fufficient fioch of materials; and alfo without allowing their blosing machine to be completed, according to the original defign, by the addition of its fecond boiler. As might have been expected, a trial of feveral months to carry on two furnaces, with only half the power of fteam that was necefliry, and an inalequate fock of materials, proving unfuccefffu?

Tumaee unfuccefint, the company, as a remedy, intend of naking up the alove dfficiencie-, ordered one of the furnaces to be blown out, and itorped altogether. This improper mealure, howcer, a orded me the opproturity of inmediately putting in pradice the plan 1 have mentioned.
". When one of the furnaces was flopped, the other continued to be blown by a blow-ripe of $2 \frac{3}{3}$ inches dimeter, and the produce of the furnace, for feseral weeh, thereafter, was not 20 tom of iron per week at an average. The engine at this time was making dhout 16 itrokes a minute, with a itroke of the air pump, about $f$ feet 8 inclee long: but when I altered the diameter of the blow-pipe, firt to :, and immediworking gears of the engine, fo is to make a froke of 5 fect 2 inches long, and abcut 19 firckes in a mi- mate, on an average, the produce wss immediately increafed. It contimued to be, on an average of nine months immediately after this improvement, at the rate of 33 tons of iron per week, of as good quality as firmerly; for, during this period, from the 2 It November 179 , to July 30,1796 , this one furnace yielded 1188 tons of iron. No more coals were confumed in working the blaft engine, of other expences abo:t the blowing machine incurred, and therefore no more power was employed to produce this great effect. It is allo of much impertance to remark, that the confumption of materials, from which this large produce was obtained, was by no means to great as formerly. The furnace required very coniderabiy lefs fiel, Lis ircn fone, and $\mathrm{te} / \mathrm{s}$ limeftene, than were employed to produce the fame quantity of iron by the former method of blowing ; and according to the itatements made out by the company's orders, as great a change vas efrected in the economical part of the bufine's.
" From the fuccefs of this exereiment, fo we.l nuthenticated, and continued for feveal months, 1 am led to be of opinion, that all blaft furn ce: by a proper adjultment of fuch machinery as they are frovided with, might greatly and adwetafous increaie their produce, by afuming this as a principle, viz. ' T/at weik the given powar it is raiher iny ageat quantity of air thrown into the furnact, sheh a moiterate aelocity, than by a lefs quantity thrown in with a greater valbcity, that the greateft benefit is derived, in the finelting of iron Aunes, in order to produce nis-ircon.' However, it is by
experiment atoe, thap, that we can be tiabled rim to find out the cxact rehations of po:er. velociay, and quantity of ait rervifite to protuce a mas 'num of effect ( r .."

Tu Mr Mufhet we are alfo indebted for the following D. reqne. account of air furnaces, which are employed in ironot an dir founderies for the purpofe of cating large picces of ord turnace. nance, and other heavy aticles.

Thefe furnaces, he oblerves," are employed for melting pig iron with the tlame of pit coal. Furnices of this kind are conitructed of various lizes according to circumftances. The fmall fizes will run down from
$\mathrm{O} \mathrm{O}_{2}$
fevea
(1) "If $O$ be the quantity of a fluid, iffuing in a given time through an aperture of the diameter $\mathrm{D} . \mathrm{V}$ its velocity, and P the power ly which it is forced through the aperture: then the area of that apertare beng as $\mathrm{D}^{2}$, the quantity of the fluid fiming in the given time will be as $\mathrm{V}^{2}$, or $\mathrm{VD}^{2}=0$.
"Again, this quantity multiplied into its velocity, will be as the momentum of the fiud expelled, or as the power by which it is expelled, that $\mathrm{i}, \mathrm{V}^{2} \mathrm{D}^{2}=\mathrm{P}$, or $\mathrm{V} \mathrm{D}=\imath^{\prime} \mathrm{P}$.
"Hcre, therefore, if $D$ is given, $V$ is as $\checkmark P$, as $M_{r}$ Roebuch atima. Allo, becaufe $V=\frac{O}{D^{2}}$, and aif, $V=\frac{\sqrt{\prime}}{D}, Q=D, P$, fo that, while $P$ remains the fame, $Q$ will increafe as $D$ increafes, and $V$ will diminila in the fame ratio.
"The problem, therefore, of throwitg the greatelt quantity of air into the furnace, with a given power, ffictly fpeaking, has no maximum, but the largeft aperture of which the engine can adinit mut be the best. It is probable, however, that thenc is a certain velocity with which the air ought to enter into the farrace, this will produce a limitation of the probiem, which, as Mr Roebuck fuggefts, is not likely to be difcovere $J$ but by experiment." Sote ly Nir Píayfar.

## $F \mathrm{O} R \quad\left[\begin{array}{lll}29 z\end{array}\right] \quad \mathrm{F} \quad \mathrm{U} \quad \mathrm{R}$

Furnace, feven to ten hundred weight, and are ufed in fmall founderies for what the trade call jobbing.
"Fig. 13. (Plate CCXXVI.) a ground plan of two large air furnaces, and chimney for melting pig or cait iron with the flame of pit coal.
"The letters ABCD point out the exterior dimentions of the ftalk or chimney, which is firft erected, leaving two openings or arches into which the fore-part of the furnaces are afterwards built. The breadth of the chimney at the particular place which the plan exhibits is 16 feet from A to $B$, and from A to D or from $B$ to $C$ fix feet fix inches. The plan is drawn at that elevation where the tiame enters the chimney by the flue or throdt, narrowed on purpole to throw back part of the tame, and keep the furnace equally hot throughout, as may be more particularly viewed in the vertical fection, fig. ${ }^{14}$.
"EE, the furnace bars on which the coals relt, and where the combullion is maintained.
" FF, openings called teafing holes, by which the coals are introduced to repair the fire.
" GG, fire brick buildings called bridges. Thefe are meant to concentrate the thame, that it may act as violently on the metal as poffible. Upon the height of the bridge much depends in fuling the metal fpeedily, and with little lois. The height of this may be feen in the vertical fection, fig. 14. G.
" HH , the charging doors, by which the metal is introduced in the thape and ftate of pig iron, lumps, frap;, \&cc. \&c. The iton generally occupies the furnace acrof to I, called the back wall, and is never sneant to appioach the bridge nearer than the dotted line, left the metal in melting fhould run back into the grates, in place of defcending into the general refervoir or cavity below. The corners or notches, $h_{h}, h, h, h$, receive a fout caft iron frame lined with fire bricks. This is lung by means of a chain and pulley, and can be raifed and depreffed at pleafure. This frame is, properly fpeaking, the charging door, and is always cherefully made air tight by means of moiftened fand.
" KK , the flacs or openings by which the flame enters the chimney. Thefe are 15 inches by 10 . On maintaining thefe openings of a proportionate fize to the other parts depend in a great meafure the powers and acconomy of the furnace.
" LL, lading doors, by which ladles are introduced, in the cale of fmall furnaces, to lift out the metal and difribute it to the various moulds.
" MMMM, binding bolts to limit within proper bounds the expanfion which takes place in the building then the furnace is highly heated.
"Fig. 14. vertical fection of one of the furnaces, and its appropriate ftalk or chimney.
"E, the grates.
" F , the teafing hole.
" G , the bridge.
" H, the charging door.
" K , the flue or opening into the chimney.
" L, the lading door.
" MM, the binder or binding bolt.
" N , the interior of the ftalk or chimney, 30 inches Equare.
" OO, the fire brick work, nine inches thick.
" PP, pace of two inches for ftuffing with fand.
" QQ, common brick building.
"RR, catt iron lintels, over which are thrown Furnace. dou'le nine inch arches, fo that at any time the inferior $\longrightarrow \underbrace{\text { ( }}$ building can be taken down to make repairs, without llaking or in the leat injuring the chimney.
" S . The dotted lines here are meant to reprefent what is called the tapping hole. When a large piece of gouds is to be calt, lifting the metal with ladles would be impracticable. A tharp pointed bar is driven up this opening. The iron then flows freely out into a large bafon of fand made for its reception. It is then conducted, by collateral chamels, into the mould.
"The fpace under the curved dotted line from $G$ to L, by S , is filled with a misture of fand and afhes. When the furnace is prepared to melt, the whole of the bottom receives a itratum of tharp clean fand about two inches thick. This is broken up at night, and frefh fand is fubftituted for it before the fire is kindled in the morning.
"Fig. 15 . is a horizontal fection of the chimney or ftalk, taken where the flues affume a perpendicular direction. The letters in this figure correfpond to thofe in the vartical fection, fig. r4. The height of the chimney ought not to be lefs than 45 feet : if 50 feet, the effect will be fooner and of courfe better produced.
"The effect wifhed to be produced in air furnaces is the fufion of a certain portion of pig or caft iron, for the purpofe of being poured or run into moulds to form articles of almoft every defcription.
"The preparation previous to melting is as follows : Preparation After the bottom of the furnace is laid, and fmoothed of the furwith frefh fand, and all the openings made air tight, nace. the furnace man introduces a kindling at the teafing hole, accompanied with new pit coal. In a few minutes a confiderable volame of dark flame mixed with fmoke is produced. The fire quickly gathers ftrength; more coal is introduced ; and the furnace now becomes filled with a yellow-coloured flame. By continuing this operation for an hour, or an hour and a quarter, the furnace and flame will have become completely white; the latter Iteady, and at times apparently without motion. The furnace man now judges the bottom to have been fufficiently hardened for receiving the pig iron without any ritk of finking. The charging door is now opened, and the pig metal thrown carefully and regularly upon that part of the bottom formerly defcribed as being appropriated for its reception. The door is again clofed and made air tight, and the operation of firing continued with unremitting care and attention.
"The time of melting depends entirely upon the quantity of metal introduced. The furnaces defcribed above are capable of melting from 50 to 60 hundred weight of metal each, and when there is a moderate circulation of air they will perform this work in $2 \frac{1}{2}$ or 3 hours. In half an hour after the metal is introduced it affumes a blackih red colour. It then begins to brighten with every additional fire, and in about one hour appears white, and begins to lofe thape, and refemble a wreath of fnow.
" An eye accuftomed to fuch heats will now difcern the metal beginning to drop, and run down the inclined plane in very beautiful ftreamlets refembling quickfilver. Eight or ten of thefe are vifible at a time, and after proceeding half way down begin to form junctions
with each other, and flow conneeked into the general cavity or relervoir. By-and-by this becomes filled, and literally forms a beautiful molten mirror, in which fometimes part of the interior furnace is reflected.
"The furnace man, by fearching at the bridge with his fiee iron or teafer, judges when the metal is nearly all gone. Of this he is certain by looking up from the peep-hole of the lading door. If the itreamlets of the running metal have ceafed, then the whole is melted, and ready for running out.
" In the operation of melting, the thrce following circumatances ought to be particularly attended to: the thinnefs or hotnefs of the metal ; the wate or lofs fultained in melting; and the quantity of coals employed.
"The frit is of the utmolt importance, as many articles in the foundery bufinels require the metal in a ftate of the greate't diwion; otherwile they will be found imperfect when taken from the fand, and unfit for fale. 'The furnace man, therefore, is always on the watch to replace the fire as it decays, and keep a large and tharp voiume of flame conftantly pafing over the metal.
"The wafte or lofs of real metal is alfo an object of great importance. This always bears a relation to the quality of the iron, the itrength and cleannefs of the coals, and the judgment and attention of the melter. Strong iron is found always more difficult to fufe; this necelfarily expofes it for a long period in contact with the flame. The reverie happens with metal that is more fragile, and eafier broken in the pig. The length of the expolure in fufing depends on this; and other circumitances being alike, the lof or walte of metal will alfo be in the fame ratio.
" There are, however, other facts not unworthy of notice. No 1 . pig iron, or richly carbonated metal, when run from an air furnace, will be found in point of quality little better than $\mathrm{N}^{\circ} 2$. or carbonated iron. This is owing to a quantity of its carbone beng defroyed during the fution. The lofs in meiting $\mathrm{N}^{0}$ I. iron, therefore, chietly confilts of carbone ; and the deficiency of metal ought never, with a clean bottom, to exceed I civt. in 20.
"Carbonated or $\mathrm{N}^{\circ} 2$. iron alfo becomes deprived of a confiderable portion of its carbonaceous mixture in fufion; and when run from the air furnare is foldom better than $\mathrm{N}^{3} 3$. metal. The lofs fuflained in melting may be averaged at $7^{\frac{1}{2}}$ per cent.
" $\mathrm{N}^{\circ} 3$. pig iron is, after melting in an air furnace, found whitiih or mottled. It is feldom fufceptible of the fame nice degree of divifion as the fuperior qualities, and lofes in fufion a much larger proportion of metal, feldom under 10 per cent. and frequently $12 \frac{1}{2}$ or 15 .
" The quantity of coals requifite to melt a given quantity of iron is various, as much depends upon the quality and fufibility of the metal. If the furnace goes one heat a day with $\mathrm{N}^{\circ}$. or 2 . iton, the quantity of coals will be from 20 to 25 cwt . for a ton of iron. If two or three heats a day, or as many tom of iron are melted at one kindling, the proportion of coals will be ncarly weight for weight of the iron melted when the coals are mixed with a fair proportion of fmall: with fitong large fplint coals, one ton of good pig itun may
 the previous berting of the furnace *"

In the redaction and fusion of ores, the improvemerit ${ }^{\circ}$ phe. of the blosi: apparatu, or the mechinery contived for Asy. $\mathrm{a} \%$ the purpofe of torcing a current of air into furnaces, where a lid hecrece of tempernture was nect fiary, has always been an important woject of condederation to the pmpertane manuaclurer ; and indeed, it appens that the kithory and of howing improvement of this kind of machinery have progref- to lenery, dively advanced, in fome cales have exceeded the improvement of other departanent of the manufachure o: this country.

In imelting fome metallic ores, as for inflance, thote of lead and tirt, the magnitude and powers of blowing machines have been lefs attended to, becanfe the r quinte temperature for that purpote is far inferior ${ }^{\text {. }}$ what is necellary for the reduction of the ores of iron. Lead and tin being naturally furible, and eafly vola tilized in a temperature beyond a bright red heat, have hitherto fixed the limits with regard to the fize of the furnace, and the quantity of blalt. The air furnace igenerally employed in the manufacture of copper, excepting in fmall blaft furnaces, in which the precipitated oxide of this metal is received, and they are fimilar to the furnaces called cupulas, and ufed at iron founderies.

The lead mill, as it is called, or machine for the reduction of the ores of lead, is of a very fimple conitruction. In the middle of a fquare building a water wheel is erected, and to the thaft of this wheel, four fimall wheels of calt iron, about 18 inches in diameter, are attached. Two pairs of bellows placed at equal dil. tances, and on each fide of the thaft, are fupported on a ltrong frame of wood. During the revolution of the fhaft of the water wheel, the fmall wheels are alfo carried round, and altcrnately deprefs the end of the lever which is attached by means of an iron chain, to an equally balanced beam. When this lever defcends, the oppofite end of the beam is elevated, and to this end there is attached by anothur iren chain, the moseable farface of the bellows. The blall produced in this way is loft, and far inferior, either with regard to quantity or denity, to the blatt neceflary for an iron turnace. The length of the bellows is ufually about 10 feet, the the breadth acrols the breech about five or fix, and they move at the rate of about 30 Itrokes a ninute.

But in the manufacture of iron, and particulaty fince whib aros the ufe of pit-coal was introduced, it is abfohtely ne- be of res: celfary to have a more powerful blowing machinery. Fher in This, therefore, has always been an eflential zequifite, facture on and has been a contlant object in this manutature; for isin. in proportion to the duantity of air thrown into the furnace, the produce and quatity of metal is increaled. In the carlier periods of this manufacture, when the fuel employed was charcoal from wood, the procels :o.. more eafly managed. Furnaces which vere buitt of fmall fize, and which were thencalled bis merk , were conlidered of fullicient cagarity to yichd protit, if thes produced a bloom or two of irun in the day, each bioors amounting to about 90 or 1201 h s. For finaller operations, hand bellows, and what vecre called fuel tlats, were decmed of fufficient power; but when the refining furnace began to be cmployed, and the iron manufac. ture branched out into the making of fig iron, and the wfining

－Fadi：ex comt：ancu in this y y，and ft in mo－
 iot this purcele，thli the privenc．of the thenmengine were fully undonood，and this a．：o．fol machine came into general we．The sleam crefin，buides ma－ 1． cther duantagen，could be employed in tuations Where the want of weter fesented firmace：boine，ereeted， 1．：otherve commodious，in being near the neceffary atcrials of ure and tual．The firt fubulitute for the E．then：bellows were cylinders compoled of wood， ctofely ioinsed，and frongly hooped．Thefe in their ：um eave place to cylimien of catl iron，fmo thly and ．．ccuately bored：and this kind of apparatus being dif－ covered and applied in the manufacture of iron，the blowing machine now affumed a more fericet and more manageable form．

But without attempting to defcribe any of the Wow ing machines in our own country，the poser and ef－ Sects of which are familiar to thofe to whom this hnow－ Inge is moll interthing，we fhall give a thort defoription of an apparatus of this hind，which is fer in motion by the preflure of a column of w．．．er，and is erected near Na－ mur in the Nctherlands．The account of this marhine is given by Billet，infector of the mines，who obferves， that its confruction is fimple，and not rery expenfive， and that it may be kept up without requiring much re－ pair．This machine，bedides，can be employed to blow －wirg feveral furnaces at once．It does not require any great ：wache by moving power，and the confumption of water is much We prefe Iefs than in the blowing apparatus of leather or vood． $4=: \in \mathrm{r}$ ．

The delent of the pition is regulated by the weight f，Furnace． whinatts 2,3 culnternuie；and the ipring of wood， \＆，vilich is bedanced when the ftalks of the pilton are at their lowe：t defcent，fertes to retard the velocity， and to provent any fudien or violent ftroke．

Tnu of thefe cylinders，ereted at one of tise forges ot Marche，fumbin air to two fumaces，which employ charcoal from wood，and one with coke from fit－coal． The stroke of the jinton is about 18 inches，and 25 firoke，in at minute，ard with this length of troke and velocits，the two pittons produce nearly about $\$ 20 \mathrm{cu}$ ． bical teet of air．The confurmption of water，having a fall of about to feet，is about 80 cubical feet．

Two timilar cylinders，erected at another furnace at the bume place move with the velocity of 19 trokes per minute．The length of each ftroke is about 22 inches，fo that it produces about 360 cubical feet of air． For this，with a fall of 10 feet， 75 cubical feet of wa－ ter are neceflary．

In the conftiuction of this blowing machine，no pe－ cultar difficulty occurs．It is not neceffary that the cy－ linders thould be accurately turned in the infide．All that is required i－，to grind or polith their intier furface with land itone．It was in this way that the cylinders and apparatus，juft cefcribed，were prepared．

The pifton，which is made of wood，has in the mid＇ Whe of it a mortile，$u$ ，fig． 17 ．and 19 ．to admit the ftalk，$p$ ，which is kept in its place by four bands or Ilraps of iton，$x$ ，fig．${ }^{17}$ ．

The band of leather，$z$ ，is about three lines in thicknefs，and about five inches broad．It is nailed to the pifton，and ought to be raifed above the groove of gutter，s．

The grooves $y, y$ ，are futik in the piton，in propor－ tion to the thichne＇s of the leather，and their externa！ diameter fiould be fomewhat fmaller than that of the cylinder．The large lids or covers of the pifton are of wood，lined with heep－fin；and their hinges，which are made of leather，are fised with frrews to the wood a bridle of leather limits the extent of the opening．

The fmall valves，which are fined at the upper open－ ing of the cylinders，at the end of the tubes for con－ ducting the air，are allo of wood，and covered with theep－thin．

The tubes or pipes which conduct the air are made of iton plates，or of timed iron，and they terminate in pipes of a convenient diameter，and proportioned to the cifferent furnaces．They fhould alio be furnifhed with heys or cocks，for regulating at pleafure the quan－ tity of the air．

I he frame which fupports thefe cylinders is of a very fimple coutruction，as will appear by infpecting fig． 16 ． It is attached and lecured to part of the wall of the buidding．

All that is neceflary to keep this apparatus in order， is with a brath to cover the internal furface of the cylin－ ders with oil once every io days．

The following are the dimenhons of the principal parts in the old French meature．

The large valves of the pifton， 8 inches by 6 ．
The interval between thefe valses， $1 q$ inches．
Stalk of the pinlon， 6 inches fquare．
The rollers on the axis $\{$ Length， 12 inches． of the whecl．$\quad$ Diameter， 36 inches．

F U R
Diameter of the cylinder, 38 inches.
Height of dut:o, 26 do.
Baillet, who has given the above detcription, propofes a new application of the moving force to this kind of blowing machine; and he obferres, that a very imfortant advantage may be derived from thefe cylinders, Since the fimple piefure of a column of water may be fubitituted for the moving power. In fig. 20 . the apparatus is fo arranged as to fhew in what way this effect may be produced.

The ftalk, $f$, of the cylindrical apparatus $c$, is common to the pifon of the fmall cylinder $d$, in which it can consey the column of water $b c$. When the cock $h$, is open, and that at $l$ is thut, the preffure of the colums muft elevate the italk $f$, and the pilton of the klowing cylinder. Then the cock $/ 2$ being fhut, and that at $l$ being open, the water of the cylinder $d$ will flow out, and the ftalk $f$ and the pifon of the cylinder will defcend. Thefe alternate motions can be eafily managed by means of levers, or regulators at $i$, fitted to the ftem of the pifon, and in the fame way as in the fteam engine. The openings at $/ 2$ and $/$ may be regulated according to the velocity which is required in the motion of the pilton, and the diameter of the cylinder $d$ will be proportioned to the fall of water $b, c$, and the volume of air which is wanted.

## Explanation of the Figures.

Fig. 16. exhibits a fection and elevation of the blowing machine.
$a$, the wall of the building. $b$, the opening in the wall for the talance bean.
$c$, one of the two beams which receive the gudgeons on which the balance beam moves. $d, c$, the balance beam ; $f$, the weight which acts as a counterpoife; $g$, the fpring of wood.
$h$, a brace or ftrap of leather, which is attached to the curved head of the beam.
$i, k, l, m$, the frame which fupports the cylinders.
$n$, the blowing cylinder of calt iron.
0,00 , tubes for conveying air to the furnace.
$f$, ftalk of the pifton.
$q$, a knee or catch attached to the thalk.
$r$, the horizontal axis of the water wheel.
$s, s$, arms attached to the axis, with rollers which raife the knee or catch $q$, and the pifton.
$t, t$, fimilar arms and rollers for moving the piton of the fecond cylinder.

The following is a defcription by Turelli Nerci, of a I hrem. three-blaft furnace, which wis conitructed is the chachath armical laboratory of the Fre:ch fchool of nime. buce.
" This furnace (fays the author) is deñincil tor fufing different mineral fubilance-, in order to afcertain the nature of them; and the experience of fix years has fhown that it anfwers the intended purpofe. By its means a very intenfe heat is obtained, and it was employed by C. Clouet for repeating his experiments o: 2 the converfion of forged iron into caft fteel, which were attended with full fuccefs.
"Chemills who have feen this furance feemed defirous of being better acquainted with the confiruation of it : the council even tranfmitted drawings of it to fevera! perfons; and what has hitherto prevented a defcription of it from being given was a defire to afcertain its power by longer ufe.
" I long ago conceived the idea of a fuing furnsce, in which the wind was diftributed in three tuyeres placed in its circumference, and at equal ditances froms each other ; but I had no opportunity of realizing this idea till I became attached to the council of mines.
" Nearly feven years ago a plan was in agitation for conitruting in the laboratory of the fohool a funing furnace capable of producing a very great degree of heat, in order to operate with facility and fueed oal larger quantities of mineral, and confequently to obtais more preciiion in the trials which might be made than had been obtained by the fmall farnaces betore employed for docimatic experiments.
" I propofed my ideas: they were approved by the council of mines; and I was ordered to caufe the furnace I am about to deicribe to be conitrasted. The principal difference betwe in it and thofe becore ufed fo: the fame purpofe is, that in the prefent one the wind is introduced through three tuyeres, placed at equal dittances from each other in its circumerence, whereas in common furnaces it enter only by one.
" This furnace is rownd, both outide and infide, and conftruked of very refraitory bricks, fecured by iron hoops in fuch a manner that they connut be difylaced. It rells oa a fquare bafe of lirong matca wook, raifed to a fufficient heighat above the ground to remerer it ealy to manage.
"The bellows ave four fect in le th, and the mean breadth of them is abou: 20 or 21 incles they are of wool, and the juint are covered with white heather. The upper par: conth of sua sid and two hale folds: the inferior, of two folds add two haif fuid. They are placed ei, ht or nine fee: k abue a wooden bow, the foints. of which are covered with !eaher, and into which the

## F U R $[296] \quad \mathrm{F}$ U R

Fiprace wind as it comes from the bellows is conveyed by a

-     -         - copler pipe, three inches in diameter, adiulted to it upper fart of the box. The box itielf is tupported by two iron bars built into the wall. From the lower part of this box defcond, in a tertical cirection, thee pipes of copper, two inclies in diameter, bent at rigit angles about 45 inches below it, to bring them into a horizontal polition, and to convey the wiad to the furnace, which is about fix fect diflant. The eatremities of thefe pipes are fitted into thrce tuveres of forged iron, fixed at equal diftances around the circumference of the furnace : thef three pipes are more or lefs curved or bent, to convey the wind into the fumace by the three apertures made for that purpere.
"About fix inches below the box is adjuited, on cach of the three tubes, which defeend in a vertical direction, a brafs cock about threc inches of interior diameter: thefe cocks ferve to intercept entirely the communication between the bellows and the furnace; and by opening them all more or lefs, or each of them feparately, any required quantity of wind may be obtained (L).
"Thefe cocks are well fixed to the tubes, and kept in their place by two clips of iron fuited to the diameicrs of the tubes, and forming a kind of three collars, which by means of four ferews embrace and confine them: thefe pieces of iron are themfelves made faft to two crutches of iron, which fupport the box and are tixed to it by fercws. The box is kept on the crutches by two itraps, which embrace it at extremity, and are fised by female forews, which are fitted to forews on the ends of thefe ftraps after they have pafied through the horizontal part of the two crutches.
"To give the proper ftrength to this furnace, a folid fquare was conflructed of mafon-work, about a foot larger on each fide than the exterior diameter of the fides of the furnace, which were from 21 to 22 inches from outfide to outfide. Bricks were placed on the ground in the middle of this erection for the extent of 18 inches, in order to form a bottom, and on this bafe were placed the fides of the furnace conitructed in the manner about to be defcribed.
"I caufed to be forged two iron hoops fix lines in thicknefs, from 2 to $2 \frac{1}{2}$ inches in breadth, and about 22 inches of exterior diameter : thefe two circles were faftened together by three bars of iron, the diffance of their exterior edge being kept at about nine inches, the height of the bricks: thefe bars are pierced with holes towards the end rivetted on the circles, and placed at equal diftances on their circumference. One of the extremes of each of thefe three bars is left of a fufficient length to pafs beyond the lower circle about an inch, in order to make them enter into three holes formed in the brick-work which forms the bottom of the furnace,
and by thefe means to prevent the furnace from becominy deranged.
"This_kind of iron frame was filled with bricks fimilar to thofe employed for the bottom of the furnace: they were rubbed one on the other to imooth them, and the conners were a little rounded; fo that, being placed upright with their broad Gdes applied to the iron hoops. the narrow fide food inwards. By thefe means all the!e bricks wore adjutied in fuch a manner as to touch cach other by their broadett faccs, and to form the fides of the fumace, the thicknefs of which was equal to the breadth of the bricks, and its depth to their leagth. Three apertures were relerved for the tuyeres which terminate the thee tubes that convey the wind, by cutting from as many bricks a portion equal to the thick. nefs of a brick.
" Thofc bricks thus adjufted were taken from the iron frame, and then replaced, putting between them a cement to conned them firmly and to fill up the joints. The duft produced by cutting the bricks was referved for this purpofe; and 1 defired the workman to mix with it a fmall quantity of clay diuted in a great deal of water, in order to make a puddle for daubing over the bricks, and in particular to put between them no more than was neceffary for filling the joints and the fmall face left between their faces in confequence of any inequality left in dreffing them.
"The furnace thus conftructed was then placed or its bafe, a ftratum of the fame mortar employed for filling up the joinings of the bricks being firit interpofed. The extremities of the three inon bars projecting beyond the lower circle were placed in the holes left in the bafe to receive them. The body of the furnace encircled with iron, both by its weight and the gentle blows given to the iron hoops above the bars which connected them, expelled the excefs of the mortar, and caufed a part of it to enter and unite with that which filled up the joints of the brick work of the circumference, which rendered it immoveable.
"The bellows is fecured as ufual by crutches of iron and fupporters fixed in the wall and to the floor: the handle is difpofed in fuch a manner, that the rope which makes it act may be pulled by the fame perfon who manages the fire of the furnace, which in certain: cafes is neceffary.
"The tuyeres of forged iron which receive the ends of the copper tubes are lecured in their proper apertures in the circumference of the fumace by pieces of brick and mortar fimilar to that employed for filling up the joints; and the ends of the copper pipes introduced into thefe tuycres are luted with the fame mortar, a little thickened with brick duft.
"The apertures of thefe tuyeres towards the interior of the furnace is only nine lines in diameter; on which account,
(r.) "Care mult be taken, when the action of the bellows ceafes, to fhut the cocks, efpecially when coals are ufed in the furnace; for the hydrogen difengaged from that mineral fubitancc afconds into the bux, and when the bellows are again made to act, may inflame, and caufe a violent explofion, or even burf the tellows. This accident once took place in the furnace here defcribed : the box burit with a loud noife on the firt itroke of the bellows, the gas which filled them having fuddenly inflamed; but by good fortune no perfon was hurt. The fame ciing happened at the houfe of C. Gorlier, lockfmith, of Paris; one of his bellows burlt with a horrid exploion st the moment when they were put in motion."
$\underbrace{\stackrel{\rightharpoonup}{n}_{11}}$ account, at the volume of air funthed by the bellows cannot pals io quick as it is produced, it becomes condenfed in the box placed above the cocks. By thefe means a very uniform blatt is obtained, which can allo be regulated by opening more or fewer of the cocks.
" During more than dix years, fince this furnace was conftructed, it has fulfered no derongement: it is not even cracked. It is however worn in the infide by the - iolence of the heat it has experienced, which has increated its diameter about two incher. The parts round the three tuyeres have alio got hollowed, fo that it has need of being repaired. It is intended to make it deep. er, and to have a kind of moveable muffs or linings made of fire clay, in order that its diameter may be reduced at pleafure: it is meant allo to conftruct it in fuch a manner, as to depolit the relt or fupport for the crucible, not on the bottom of the furnace, but on bars of forged iron placed at the difance of fome inches from that botom, fo as to leave below them a vacuity in which the blatt of the bellows may be diffufed, and from which it may rife, pafling between the bars to traverfe the mafs of charcoal which furrounds the crucible. The blatt will then produce a more uniform fire, and the fame can no longer be directed againft the fides of the crucibles; fo that the rik of their breaking by fudden inequalities in the heat will he much lefs.
"This alteration is going to be immediately carried Ento execution, and the method propoled for doing it is as follows:
"A round frame will be made of forged iron, in which bricks will be placed in the fame manner as above deferibed. In the lower part of the furnace an aperture will be referved for raking out the afhes, which will be clofed by means of a door of baked earth carefilly luted with clay. Some inches above the bottom of the furnace will be placed a grate of forged iron, and between this grate and the bottom of the furnace the ryyeres will terminate, and the blat be introduced. Filuffs or linings of very refractory earth will then be iortroduced, fo as to defcend to this grate. There will be two of them, one within the other, and both within the body of the furnace. At the lower part thefe muffs will be furnithed with a rim, projecting outward fo as to leave between the body of the furnace and the muffs - vacuity, vhich will be luted at the bottom with clay, and which will be filled with pounded glafs, or any other fubftance a bad conductor for heat.

The in:crior muff, or both of them, may be removed at pleafure to obtain a furnace of greater or lefs capacity according to the operations to be performed. It is propofed to make the muffs wider at the top than at the bottom.

## F U R [ 298 ] F U R

Turnace. Mr Collier, in a paper communicated to the Mancheiler Phindophical Society, has delivered fome importunt obfervations oa iron and iteel, with a more correct account of the proceff for the manufacture of the latter than has hithe:to been given. Fo this account he has added the defription of a furnace for the cunverfion of iron into ficel. As his obfervations and reafonings are extremely valuable, we thall lay the whole before our readers in his own words.
Account of the proceli. for mak $\mathrm{n}_{5}$ iron and fteel, impert \&.
" After examining (hays Mr Collicr) the works of differeat author, who have written on the fabject of making iron and het, I am perfondel that the accounts given tog them of the neceflary procefes and operations are extremely imperfect. Chenits have exaniined and
defcribed the various compried minerals containing iror with great accuracy, but have beea lefs attertive to their teduction. it his obfervation more particularly applies to fieel, of the making of which I have not feen any correct account.
"It is fingular to cbitive, how very impeefently the cementatich of iron hor, been decribed by men of great tmincuce is the ficure of chomitry. Citizen Fourtroy flates the lenath of time neceliary for the cenien:stica of iren to lie about taselise loors; hat it is dillrult to dilcover whether he alludes to calt or to bar ficel: for he fays, that fhort bars of iron are to be put into in earthen box with a cement, and clued up. Now ficel is made from bars of iron of the whal length and thicknefo: but caft tleel is made according to the procefs defcribed by Citizen Fourcroy, witl/ this efiential diference; the operation is begun upon bar fiteel and not bar iron.
" Mr Nicholfon is equally unfortunate in the account given in his Chemical Didionary. He fays, that the ufual time required for the cementation of iron is from fix to ten hours, and cautions us agaimit continuing the cementation ton long; whereas the operation, from the beginning to the end, requires fixteen days at leaf. In other parts of the operation he is crually defective, confounding the making of bar with that of calt tteel, and not fuily defcribing either. In fpeaking of the ufts of fteel, or rather of what conftitutes its fuperiority, Mr Nichollon is alfo deficient. He obferves, that its mot ufeful and advanageons froperty is that of becoming extremely hard when flunged into water.' He has here forgoten every thing refpecting the temper and tempering of deecl initrument, of which, however, he takes fome notice in the fanse page. 'Phunging into water' requires a littie explanation: for if very hot fteel be immerfed in cold water without great cantion, it will crack, n?y, fometimes brok to pieces. It is, however, nereflaty to be se, in ordef to prevent the fleel from growing for end eruang to the fiate of malieable iron: for, were it pernitted to cool in the open air, the catne which is hold in combination would be dififared (い).
"I fhall, at prefent, confine my remarks to the ope. Furnace. ration performed on iron in Sheffield and its neigh- Procefs in bourhood: from whence various communications have Siefield, been tranfmitted to me by refident friend, and where I have myfelf feen the operations repeatedly performed.
" The iron made in that part of Xorkthire is procured from ores found in the acighbourhood, which are of the argillacecus hind, but intermised with large proportion of foreign matter. Thefe, however, are frequently combined with ri her ores from Cumberland and other places. The ore is firt roafted wita cinders for three days in the open air, in order to expel the fulphureous or arfenical parts, and atterwards taken to the furnaces: fome of which are conitructed to that their interaal cavity has the form of two four-fided pyramids joined bafe to bale; but thofe mott commonty ufed are of a conical form, from 40 to 50 feet high. The furnace is charged at the top with equal parts off r the t . coal cinder and lime-fone. The lime-itone atts as a duit:on of fius, at the fame time that it lupplies a fuficient quan- ion ore, tity of earthy matter to be converted into fcorice, which are neceflary to detend the reduced metal from calcination, when it comes near the lower part of the furnace. The fire is lighted at the bottom; and the heat is excited by means of two pair of large bellows blowing alternately. The quantity of air generally thrown into the furnace is from a thoufand to thelve hundred iquare feet in a minute. The air pafies through a pipe, the diameter of which is from two inches and a quarter, to two and three quarters, wide. The comprefion of air which is neceffay is equal to a column of water fous: feet and a half high. The ore metts as it pafles throug? the fire and is collected at the bottom, where it is maintained in a liquid fitate. The llag, which falls down with the fufcd metal, is let off, by means of an opening in the fide of the furnace, at the difcretion of the workmen.
" When a fufficient quantity of regulus, or imperfectly reduced metal, is accumulated at the bottom of the furnace (which ufually happens every eight heurs), it is let off into moulds; to form it for the purpoís intended, fuch as cannon or pig iron.
"Crude iron is diftinguifhed into white, black, and gray. The white is the leaft reduced, and more brittle than the other two. The black is that with which a large quantity of fuel has been ufed; and the gray is that which has been reduced with a fuff.cient quantity of fuel, of which it contains a part in folution.
"The operation of refining crude iron confilts in and for reburning the combuftible matter which it holds in fo- fining crude lation; at the fame time that the remaining iron is more perfectly reduced, and acquires a fibrous texture. For this purpoll, the pizs of cait iron are taken to the forge; where they are firll put into what is called the refinery: which is an open chatcoal fire,

[^10]
## F U R $\left[\begin{array}{ll}2,9 & ]\end{array} \quad\right.$ U R

For ate ins, urged ly pain of bethome, wothed by water or a theam engine; but the comprellina of ait, in the refinery, cught to be lef than that in the Llent fornace. After the metal is melted, it is let out of the fire by the wormer, to dicharge the forie: and then toturned and fobjected to the Wait in lefore. Tinis operation is fonctimes repeated two or theree times betore any apeatance of malleability (or what the workmen call coming into mature) takes place; this they know by the metal's firt affuming a granuler appearatce, the particles apparing to repel cach other, or at leatt $t$ o have no figns of attraction. boon afterwards they begin to adhere, the attraction increates very rapidly, and it is with reat difliculty that the yhole i, prased fron ruming into one mals, wheis it is detirable to avcil, it being more convenient to tamp fimall pieces into thin cakes: this is done by puttivg the iron inmediately under the forge hommer and beating it in:o piece, about an inch thick, which eatily Leak from the rett during the operation. Thefe imall piectsare then collected and piled upon circular itones, Which are an inch thick, nine inches iar diameter, and about ten inches high. They are afterward put into a funace, in shich the fire is reverberated upon them u'til they are in a lemi-t?ud thate. The workmen then take one out of the furnace and draw it into a bar under the hammer; which being finibed, they apfly the bar to another of the piles of femi-lluid metrl, to which it quickly coments, is taken again to the hamner, the bar firt drawn forving as a handle, and draun down as before. The imperfetion in the bars are rerudied by putting them into another fire called the chafery, and agaia fubjecting them to the aztion of the forge hammer.
"The abowe met.?od is now molt in ufe, and is called tlourilhing ; but the iron made by this procefs is in no refpect fupetior to that which I ain going to detwibe. It is, lowever, not fo evpenfive, and requires les !abeur.
"The procefs for refining crude iron, which was moft cmmon previoully to the introduction of dourihing, is as follows.
"The pig; of caft iron are put into the refinery, as above, where they remain until they have acquired a confillence refembling paite, which happens in about two hours and a half. The iron is then taken out of the refinery and laid upon a calt iron plate on the foor, and beaten by the workmen with hand hammers, to knock off the cinders and other extraneous matters which adhere to the metal. It is afterwards taken to the forge hammer and beaten, frit gently, till it has obtained a listle tenacity; ther the middle part of the picece is drawn into a bar, about half an inch thick, three irches hroad, and four feet long; leaving at each and a thick fquare lump of imperfect iron. In this form it is c:lled ancons. It i : mow taken to the fire called the chafery, made of common coal ; after which the two ends are dran out intu the form of the middle, and the eperation is frimifled.
"There is alio t thind mothol of rendrane truse inon mallabl", which, I thati., pronition to be aturdantly more advanta cous than ether of the two tos mer, as it will difente both with the whery and aces. chafery ; and nuthing mare will be necelluy than a severbrating furnace, and a fumse to sive the me. tal a malleable hent, about the midtl of the operation. The lage forse hamate will allio the it to dis.

 mer, mull be worked cituer 'sy a " + ter wheclor a itwan enginc.
"It is by the operation of the forge hammer ur metal vollers, that the iroa is deprived of the etmmain, por tion of impurity, and acquires a fibrows tevalue.
"The iron made by the three fonegoiace proretes is equally valuable, for by any of tiem the $m+1$ is sendered pure; but after thofe diferent overat.on are fnilhed, it is the option of many of the mo.t jucti-jus wookensin iron, that laying it is a danp pates, to fome time, improves its quality; and to this anome, fome attribate the fupcriority it it reign iron, more : me alopdiag between making and ufing the metal. To the lat ter pert of this opinion 1 can by no moans accede, as it is vell known that the Suedih (o) ore contain mech lef hetecogeneous matter than ours, and ate fenerally much richer, as they urually yield about 72 per quintal of pure iron, whereas the average of ours is not mors than $3 \rho$ or $\Psi^{\circ}(\mathrm{P})$ : add to this, that the Swedih ore, are fmelted in wood fires, which gives the iron an additional fuperiority.
" Iron infruments are cafe-hardened by heating them in a cinder or charcoal fire; but if the firt be ufed, a quantity of old leather, or bones, mult be burnt in the fire to iupply the metal with carbone. The fire mutt be urged by a pair of bellows to a luthicient degree of heat; and the whole operation is ufually completed i:t an hour.

* The prozefs for cafe-hardening iron, is in fact the fame as for converting iron into ttecl, but not continued fo long, as the furface only of the article is to be impregnated with carbone.
"Sume attempts have been made to give call iron, by carc-hardening, the texture and ductility of flee?, but they have not been very fuccetsful. Table and penknife blades have been made of it, and, when ground, have had a pretty goul appearance; but tho edges are not firm, and they foon lofe their polith. Common table knives are frequently made of thi- me tal.
"The cementation of iron convers it into thecl:a fubitance intermediate between crude and malle ble iron.
"The furnaces for making fiecl are conical buih'd- Furnase on ings; about the middle of which are two trutgh of making brick or fire slone, which will hold about four tons of thee!. iron in the bar. It the lontom is a long grate for fire.
"A layer of charcoal dult is put unon the bottom of P $p z$
(o) "Steel is conmonly made of Swedifh iron."
p) "The iron made from the ore found in the neighbourhood of Sheffield, contains a great deal of phofphet " iron, or ficerite, which raders the metal brittle when cold."

## F U R

Burace the trough : and, upon that, a laver of bar iron, and to on altenaty until the trough is full. It is then corared over with clay to heep out the air; which, if adanited, would efectually prevent the cementation. When the fire is put into the grate, the heat palles tound by means of flues, made at intervals, by the fides Whe trough. The lire is continued until the converion is complete, which generally happens in about eight or ten days. There is a hole in the dide by which the sonkmer draw out a bar occafionally, to lee how far $\therefore$ ie tamimutation has proceeded. This they determine It he bliters upon the furface of the bars. If they be nut auliciently changed, the hole is again clofed carefilliv to exclude the air; but if, on the contrary, the change be complete, the fire is extinguibed, and the dieel is leit to cool for about eight days more, when the procts for making blitered iteel is finithed.
"For fanll wares, the bars are drawn under the tilt hammer, to about half an inch broad and three-fixteeaths of an inch thick.
tinted Rtee." "The change wrought on blitered fteel by the tilt hammer, is nearly fimilar to that effected on iron from the rennery by the forge hammer. It is made of a nore tirm texture, and drawn into consenient forms for we.

## German <br> ftecl.

"German iteel is made by breaking the bars of bliftered fiteel into finall pieces, and then putting a number of them into a furnace; after which they are welded together and drawn to about 18 inches long; then doubled and welded again, and finally drawn to the fize and thape required for ufe. This is alfo called thear ftee?, and is luperior in quality to the common tilted fteel.
Gaft fteel. "Cait fteel is alfo made from the common bliftered facel. The bars are broken and put into large crucibles with a flux. The crucible is then clofed up with a lid of the fame ware, and placed in a wind furnace. By the introduction of a greater or fmaller quantity of fux, the metal is made harder or fofter. When the fuhon is complete, the metal is caft into ingots, and then called ingot fteel; and that which afterwards undergoes the operation of tilting, is called tilted cait lieel.
"The caff fteel is the moft valuable, as its texture is the molt compact and it admits of the finelt polith.
"Sir T. Frankland has communicated a procefs, in ilae Tratactions of the Royal Society *, for welding catt fleel and malleable iron together; which, he fays, i, done, by giving the iron a malleable, and the fteel a white heat; but, from the experiments which have been made at my requeft, it appears, that it is only foft catt ilecl, little better than common fteel, that will weld to iron: pure fteel will not ; for, at the heat defrribed by Sir T. the beft caft iteel either melts or will aut bear the hammer.
" It may here be obferved, as was mentioned before, that fleel is an intermediate ftate between crude and ralleable iron, except in the circumatance of its reductiun being complete; for, according to the experiments oi Reaumur and Bergman, fteel contains more hydro-
 lefs plumbago than the firlt, but more than the latter; -an equal portion of manganefe with each; ;-lets filiceous carth tlan cither-more iron than the firlt, but ;ets than the fecond. I $\because$ fufbility is likewif interme-
diate, between the bar iron and the crudc. When theel Furnace. has been gradually cooled from a ftate of igrition, it is malleabie and lets, like bar iron; but when ignited and plunged into cold water, it has the hardnefs and brittlenet, of crude iron.
'. From the foregoing facts, we are juftified in drawing the lame concluhons whi Reaumur and Bergman, but which have been more perfecily explained by Vandermonde, Berthollet, and Monge, that crude iron is a regulus, the reduction of which is not complete; and which coniequently will differ according as it approaches more or lefs to the metallic ftate. Forged iron, when previoully well refined, is the pureft metal; for it is then the mon malleable and the mot ductile, its power of welding is the greateft, and it acquires the magnetic quality fooneft. Steel confilts of iron perfectly reduced and combined with charcoal; and the various differences in blitered iteel, made of the fame metal, confit of the greater or lefs proportion of charcoal imbibed.
"Iron gains, by being converted into fteel, about the hundred and eightieth part of its weight.
" In order to harden fteel, it muft be put into a clean Háldenirg charcoal, coal, or cinder fire, blown to a fufficient de-fteti. gree of heat by bellows. The workmen fay, that neither iron nor fteel will harden properly without a blaft. When the fire is fufficiently hot, the inftrument intended to be hardened mult be put in, and a gradual blalt fiom the bellows continued until the metal has acquired a regular red heat; it is then to be carefully quenched in cold water. If the fteel be too hot when immerfed in water, the grain will be of a rough and coarfe texture; but if of a proper degree of heat, it will be perfectly fine. Saws and fome other articles are quenched in oil.
"Steel is tempered by again fubjecting it to the ac-Tempering tion of the fire. The inftrument to be tempered weit. will fuppofe to be a razor made of call fteel. Firit rub it upon a grit thone until it is bright ; then put the back upon the fire, and in a thort timc the edge will become of a light ftraw colour, whilit the back is blue. The fraw colour denotes a proper temper either for a razor, graver, or penknife. Spring knives require a dark brown; fciffars, a light brown, or ftraw, colour; forks or table knives, a blue. The blue colour marks the proper temper for fwords, watch-fprings, or any thing requiring elafticity. The frings for penknives are covered over with oil before they are expofed to the fire to temper.

## Expianation of the Figures.

"Fig. 29. is a plan of the furnace, and fig. 29. is 2 fection of it taken at the line AB. The plan is taken at the line CD. The fame parts of the furnace are marked with the fame letters in the plan and in the fection. EE are the pots or troughs into which the bars of iron are laid to be converted. $F$ is the fireplace; P , the fire bars; and R, the afhpit. GG, \& s. are the flues. HH is an arch, the infide of the bottom of which correfponds with the line IIII, fig. 28. and the top of it is made in the form of a dome, having a hole in the centre at K , fig. 29. LL, \&c, are lix chimneys. M1MI is a dome, fimilar to that of a glafs-houfe, covering the whole. At N there is an arched opening, at which the materiat arc taken in and out of the fur-

## F U R [ 301 ] F U R

Farnace nace, and which is clofely built up when the furnace is charged. At $O O$ there are holes in each pot, through which the ends of three or four of the bars are made to project quite out of the furmace. Thele are for the purpofe of being drawn out occafionally to fee if the iron be futiciently converted.
" The pots are made of fire tiles, or fire itone. The bottoms of them are made of two courfes, each courfe being about the thicknels of the fingle courle which forms the outfides of the pots. The infides of the pots are of one courfe, about double the thicknefs of the outfide. The partitions of the Hues are made of fire brick, which are of different thickneffes, as reprefented in the plan, and by dotted lines in the bottom of the pots. Thele are for fupporting the fides and bottoms of the pots, and for directing the Hame equally round them. The great object is to communicate to the whole an equal degree of heat in every part. The fuel is put in at each end of the fire-place, and the fire is made the whole length of the pots and kept up as equally as pofible."

In a memoir publifhed by Du Hamel, the inconvenience and expence which attend the procefs commonly in ufe, for refining lead or feparating the filver from this metal, are pointed out, and a more economical procefs is propofed. This procels, which is known by the name of cupellation, is performed in a veflel called the cupel, which is made of the athes of the bones of animals, or of vegetables, after feparating, by means of water, the faline parts which adhere to them. But the difficulty and expence of obtaining a fufficient quantity of thefe materials, led him to contrive fomething elfe as a fubititute, which might be lefs coitly and more eafly obtained.

For the purpofe of performing the procels in the way here recommended, it is not necelfary to make any alteration in the general conitruction of the furnace. AII that is required is, to have a fufficient number of canals or openings towards its bafe, to allow the efcape of the moiture. Thefe canals are covered with a bed of fcoria, on which is raifed a pavement formed of the moft porous bricks, and about a brick in thicknefs. On this floor or area, which fhould be a little concave, in the fame way as the ordinary cupels are formed when they are made of afthes, is placed a quantity of calting or moulding fand, flightly moitened; and if the fand has not a fufficient quantity of earth, lome clay is added, to give it confifence, and the whole is carefully mised together. This fand is beaten together, and a concave veffel is made of it, of an equal thicknefs in all its part . W'hen the balon has been uniformly beaten, it will be proper to fift over its whole furface a fmall quantily of wood afhes, well wafhed with water, and theie are allo beaten down with a peitle.

The cupel being thus prepared, the head of the furnace is put on, and a moderate fire is kindled and kept up for fome hours, to carry off part of the moitute of the fand. The remainder is diffipated without inconvenience, by means of the canals, during the prorefs. After it has been futiciently dried, the head of the furnace is again taken off, and allowed to cool a little. A quantity of traw or hay is put upon the baton or cupel, to prevent any injury from the weight of the bare of lead on the fand. To avoid this till more, it is re-
commended to have the lead to be purified cat into the Furnare. form of hemifpheres, in place of bars.

A futlicient quantity of lead being introduced into the furnace, the head is luted on with baked cliy, attd the fire is applied in the ufual way. As foen as the lead is completely fufed, the bafon appears covered win! the burnt lraw : this is removed by means of an iron inftrument, and this operation is repeated feveral times. When the lead begins to grow red, the action of the bellows commences, at firit loftly, and the blait is io directed that it may ftrike the centre of the curel. To effect this more completely, a fmall round plate of iron is attached to the extremity and upper part of the pipe by means of a hinge, fo that at each blait it is half raifed, and the current of air is directed to the furface of the fuled metal.

After the whole of the foum that rifes has been removed, and the lead is covered with a ftratum of litharge, a fmall gutter is made by means of a hook for the purpofe, in the fand of the cupel. This is gradually and cautiouily hollowed, till it is on a level with the furface of the bath, and then the litharge driven by the blaft towards the anterior part of the furnace, will How this way, and fpread itfelf on the floor in the ufual way. When the operator perceives that the litharge has been removed, he flops up the glater with mointened athes, till another quantity of litharge appears on the furface. He then re-opens the gutter, which is now made decper in proportion to the diminution of the fufed metal, but at the fame time taking care that no part of the lead efcapes, efpecially towards the end of the procels, becaufe then a confiderabie portion of tilver would be carried off.

In this way the procefs is conducted till the feparation of the filver begins to take place, obferving at the fame time to increafe the heat as the quanity of fuled metal diminifhes, becaufe then the filver is collected together ; and fince it is much more difficult to keep it in fution than the fmall portion of lead which remains combined with it, the feparation would be very imperfect, without the application of a fufficient temperature. Inftead of having only one-twentieth of lead, which is the ufual proportion in the common procef, the quamtity would be mucls greater, and this would renter the fecond operation, the relining of the filver, much mo:* difficult.

Du Hamel obferves, that a cupel of fand, well made, will anfwer for the repetition of the procefs feveral times, without renewing it at the end of each operation, as is the cafe with thofe of athes. The only precaution to be oblerved is, to remove the hind of varnith of osyde of lead which remains on the files of the gutter by which the litharge flowed out, that the new fand with which it is to be filled up may combine eatily with the old.

The length of time which the reverberatory furnace may be employed in fincting the ores of le..d, and even in reducing litharge, is a proof that the oxyde of lead acts oaly on the furfice of the cupel, and penetrates a very fmall thichnels. After the procefs has been feveral times repented, this crult is removed, and it is fuled for the purpofe of ubtaning the lead. This procefs will be as caly as the reduction of the metal contained in the athes of the ored 1 ry cupels, and in monh fimalle.

3. Above this door, and fix incles fom the hate, an ther dour in opened. of the figure of a kement of a circle, four iucho, broad at the bottum, and three incles and a half high in the :nidutie.
4. Tbree iron plates ane then to he faftened to the fore-part of the furnace, the firft of them houk he if inches long, half on inch high, and to fattened with three or four rivets, that it, lower edge may teit againt the bottom of the furnace. Between this phate ain! the fide of the furnace a fpace mutt be left, fo wide that the fliders of the lower door, which are made of a thicker iron plate, may move eafily in the groove the focond iron plate, which is 11 iuches long, and three inches high, is fattened parallel to the firt, in the face between the two doors. Both the upper and lower edges of this plate form grooves with the fide of the furnace, for receiving the lliders which thet the doors. The thid plate of the fame dimenfions with the firt, is rivetted clofe above the upper door, and forms a groove for receiving the edge of the lliders which move that door.
5. For the purpofe of clofing the doors, two lifders of iron-plates mult be adapted to each of them. Thele lliders are moved in the grooves. The two tliders belonging to the upper door have each a hole near the top; in the one there is a fmall hole ? of an inch broad, I inch long; and the other a femicircular opening one iach high and two broad. To each tlider there is a tsundle attached, to lay hold of it when it is moved.
6. Five round holes, an inch diametcr, are bored in the furnace, two in the back part, and two in the fore part, five inches from the bottom; but $3 \frac{1}{2}$ inches from each fide of the furnace. The fifth hole is at the height of an inch above the upper edge of the upper door.
7. The iafide of the furnace mult be armed with iron hooks, about 3 inches from each other, and projecting $\frac{1}{2}$ inch. The ufe of thefe hooks is to fecure the lute with which the furnace is to be lined.
8. A moveable, hollow, quadrangular pyramid, alfo of iron, and 3 inches high, is to be fitted to the upper opening of the furnace, 7 inches broad, and ending above in a hollow tube, 3 inches in diameter, about 2 inches high, nearly cylindrical, but converging a little at the top. This tube ferves to fupport a funnel for conveying tle fmoke into the chimney. This cover has 2 handles to lay hold of it. To fecure the cover on the furnace, an iron plate is rivetted to the right and left of its upper edge, and turned down towards the infide, fo that a furrow may be made, open be-
$F$ U $i \quad\left[\begin{array}{lll}303\end{array}\right] \quad F U R$
Furaree fure and behind, for receiving the laterai cdges of the coser.
9. A fiuare ledge, made of thick iron flate, is ined at the top of the upper cdge of the lo:ser dom, the fupporting the grate and the lute, and then it my lee e.my introduccd into the cavity of the furmace, it inva'd te of two picces.
10. Ircn bars are then to he fisel in the infide of the fumace, for funforting the fuel. There mall be equal in length with the diancter of the formace, alout ? inch thick, and ? inch ditant from each other. They are fupported at their cotremities a fouare iron ledge.
11. To prevent the dimipation of the heat, and the defrution of the iron, by teing repeatedly made red hot, t':e infide of the furnace mutt be lined with lute, about a finger's bradth, or rather more, in thichnels.
Coating for For luting furnaces, Detor Black recommended a furnaces. fimple mixture of fand and clay. The proportions for refiuting the violence of fire are four parts of fand to one of ciay; but when defigned for the lining of furnoces, he ufes fix or feven of fand to one of clay, the more effechually to prevent the contraction of the later; for it is known from experimerts, that clav, when expofed to a ftrong heat, contracts the more in proportion to its furity. The fand fettio, into lefs t uth when wet, and does not contrast by heat, which j: allo reffits as well as the clay itfelf.

Beides this outhide lining next the fire, $\mathrm{D}_{\mathrm{r}}$ Black ules another to be laid on next the iron of the furnace; and this confiits of clay mixed with a large proportion of charcoal dult. It is more fit for containing the heat, and is put next to the iron, to the thicknefs of an minch and an half. That it may be pretty dry when firit put in, he takes three parts by weight of the charco: duft, and one of the common clay, whith toull be mi:ied tozether when in dry powder, otherWife it is very diflicult to mix them perfectly. As * :ch water is adted as will form the matter into balls; OH thefe are beaten very firm and compact by means of shammer upon the infide of the furnace. The other the is then fpread over it to the thicknels of about half an inch, and this is alfo beaten folid by hammering; aticr which it is allowed to dry flowly, that all cracks and fitues may be avoided; and after the body of the furnace is thus lined, the vent is fcrewed on and lined in the fame mamer. It nutk then be allowed to dry fir a long time; after which a fire may be kindled, and the furnace gradually bieated for a day or two. ' 'he fire is then to be railed to the greatelt intenfity; and thes the luting acquires a hardnefs equal to that of frec-Atone, and is afterwards as lafting as any part oi the furnace.

Nica of operating with this strmace.

To perforn an operation in this furnace, two iron bars an itu h thick, and of fufficient length, to projeat a little beyond the holes of the furnace, are paffed through four luver holes, which are placed hefore and behind, directly uppolite to each other. Thefe bars fupport the muife, which is introduced through the upper opening of the farnace, and placed upon the bars, in fuch a way that the open fide of it may be near the imner horder of the upper door. The fuel is introduced through the top of the farnace, and the bef fuel is charcoal made of land
wood. It thould Le reduced to fntall piecce, that thicy Fws: may redily fatl betneca the medle and the files of the ——rer funace. 'liee mulle is to be cowered with fuch, E., the
 not be too final', becm'o thry may fatl immediately tisurys the intertice wi the grate, of Le ton rapidy conlume ind thes incrian of the 1, watnty we athe, obfiruch the cmatent of air.

As the management of the fiec is of great importalice, Manaze. for the liccels of operations in the furaace, the fullumement the ing disections may be attended to. To incue.e thectit: keat to the utme?, the door of the ahh-hole may ic left open; the diders of the upper door dravin twaind. cach other, fo as to touch in the middle, and the co:er and funnel adapted to its tule, placed on the tow of the furnace. 'The heat is till farther increalid 1 , futling red burning conls into the open upper don:. By thutting the upper dyor with the dider, which has a narrow oblong hole in it, the heat is dimiribhed, and it is itill farther diminibed by lhutting the door with the other dider, having the femicircular hole. The heat is alfo diminithed by remosing the funnel at the top of the cover; and the heat is lef by partially or totally fhutting the door of the athbule, becaule then the carrent of air neceffary to c: cite combuttion is obltructed.

The heat of the furnace is alfo increafed in propo: tion to the diminifined fize of the muttle. Tlie heat i ftronger too, according as the mutle has more and larget fegments cut out of it, as the fides of it are thinmer, arid as the number of veffels placed in the linder part of it is increafed; and the contrary. It may be here ouferved, that when many of the conditions neceffaty to produce ftrong heat are wanting, the operator, with all his fagacity, will fcarcely be able to excite combultion in fuch a degree in common affay furnaces as to fuccees? well in his operations; and even when he employs bellows, and introduces coals by the upper door. 'The grate, therefore, ought to be placed nearly three inches below the muffle, that the air rulting through the alhhole, may not cool its bottom, and that the fimaller coals, almoit already confumed, and the aftes, mey more ealily fall through the interitices of the grate; larger coals, fit for keeping up the requinite degree of heat, muft be ufed. The funnel is added, that the blowing of the fire being increafed by means of it as much as pollible, may be brought to the degree that is wanted : for the fire may be at any time dimimifhed, but withoy: the afilitance of proper apparatus, it cannot alwas bo increafed at pleafure.

$i$, a hole throush which the fcoria is remuved.
k, the paffage for the flame and timoke, or the lower part of the chimncy, to be carried to the height of 30 feet.
/, a hole in the roof, through which the ore is introduced into the furnace.

Fig. 34. is a longitudinal fection of a refining furnace.
c $a$, the building.
$b$, the channels to carry off the moifture.
$c$, other fmall channels, which meet in the middle of the bafon.
$d$, the bafon made of bricks.
$c$, a layer of athes.
, the hollow or bafon containing the melted metal.

- the hole for the fmoke and flame.
$h_{1} h$, two openings for adinitting the pipes of the bellews.
$\therefore$ the vault or dome of the furnace.
$t$, the fire-place.
i, the grate.
$m$, a hole below for the admifition of air.
$n$, a hole in the vaut, which ferves to cool the furrace.

A convenient portable blaft furnace, contrived by Mr $\Lambda i k i n$, and defcribed by him in the 17 th vol. of the Philufophical Magazine, will probably be ufeful to fome ri our chemical readers. "It is (he fays) particularly codapted to thole who, like myfelf, can only devote a imall room and a moderate ilare of time to thefe purfints.
" Dr Lewis, in his Commerce of the Arts (page 27), defcribes a very powerful blatt furnace formed out of a black-lead pot, which has a number of holes bored at froall diftances in firal lines all over it, from the bottom up to fuch a height as the fuel is defigned to reach to. 'Ihis is let half way into another pot, which laft receives the nozzle of the bellows, fo that all the air fent in is diftributed through the firal holes of the upper pot, and concentrates the heat of the fuel upon the crucilile, which is placed in the midat.
" The furnace which 1 am going to defcribe refembles very clofely this of Dr Lewis; with this difference, however, that the air-holes are only bored througin the bottom of the pot, and this merely ftands un.on anotber piece, inttead of being let into it. It is
on this account fomewhat more commodious, and iima. Iurnace. gine not lefs powerful.
" Fig. 35 . is a view, and fig. 36. a fettion, of the furnace. It is compoied of three parts, all made out of the common thin black-lead melting pots fold in J. ondon for the ufe of the goldiniths. The lower piece, $A$, is the bottom of one of thefe pots cut onf fo low as on ly to leave a cavity of about one inch, and ground fmooth, above and below. The outfide diameter over the top is $5 \frac{1}{\frac{1}{2}}$ inches. The middle piece or fireplace, B , is a larger portion of a fimilar pot with a cavity about fix inches deep, and meafuring $7 \frac{\gamma}{2}$ inches over the top, outfide diameter, and perforated with lix blaft holes at the bottom. Thefe two pots are all that are efientially neceflary to the furnace for moft operations: but when it is wihed to heap up fuel over the top of a crucible contained within, and efpecially to protect the eyes from the intolerable dazzle of the fire when in full heat, an upper pot, C , is added of the fame dimenfions as the middle one, and with a large fide opening cut out to allow an exit to the fmoke and flame. It has alfo an iron ftem with a wooden handle (an old chifel will do very well), to lift it off and on.
" The bellows (which are double) are firmly fixed, by a little contrivance which will take off and on, to a heavy ftool, as is reprefented in the plate; and their handle fhould be lengthened, to make them work eafier to the hand. To increafe their force on particular occafions, a plate of lead may be tied on the wood of the upper flap. The nozzle is received into a hole in the pot A, which conducts the blatt into its cavity. From hence the air paffes into the fire-place, B, through fix holes, of the fize of a large gimlet, dilled at equal diftances through the bottom of the pot, and all converging in an inward direction, fo that, if prolonged, they would meet about the centre of the upper part of the fire. The larger hole through the middle of the bottom of the fame pot is for another purpofe. Fig. 37, is a plan of the fame, fhowing the diftribution of thele holes.
"As a fland or fupport for the crucible, I have found no method fo good as to fit an earthen fopper into the bottom of the pot $B$, through the large centre hole which is made for this purpofe. This keeps the crucible in its proper place, in ftirring down the coals and managing the fuel. Thefe ftoppers are made with great eafe and expedition out of the foftened fire-brick fold in London. A picce of this brick, made to revolve a few times within a portion of iron or earthenware tube, prefently takes the form of its cavity, and comes out a very neat portion of a cylinder or cone, according to the thape of the tube, from which the ftoppers may readily be fathioned. Fig. 38. reprefents one of thefe floppers, which is alfo feen in its proper place in fig. 36 . fupporting a crucible.
"As the conftruction of this furnace (cxclufive of the bellows and its flool) is eafy to any one at all ufed to thefe little manual operations, 1 truft that the working chemift will allow me to add a few words on the method which I have found the onofl convenient and coonomical. Almon any broken pot of the proper width will furnifh the lower piece $A$; and often the middle and upper pieces may be contrived out of the fame refufe matter. Dr Lewis advifes a faw to cut thefe pots;

## 

Farnac: hut mon fuws are too thick, and when a little wifed, the teeth get rounded off, which makes them work intulerably flow. I have found by far the hel tool to be an old tatle knife, or rather two of them, worn thin by whe and hacked and jugged as deeply as poffible, by atriking the edges frongly agninal each other. Thete iourk well and expeditiouly, and weon they beome dull are again roughened by the lame fimple means. The holes may be drilled with a common gimlet of the larget fize, and a little fleadinef of hand will eatily enable the operator to give them the oblique direction with fufficient accuracy; for much is not required. To make a fmooth furface to the parts intended to adapt to each other, firft wear them down a little with the loft fire-brick, and then grind them with water on a tlat free-ftone (a fink-ftone for example), and latty make them entirely fit by rubbing one iurtace on the other.
** No luting of any kind is ever required; fo that the whole may be fit up and taken down immediately. Nor is it neceffary to bind the pots with metal hoops; for they are thick enough to endure confiderable blows without breaking; and yet they will bear, without cracking, to be heated as fuddenly and intenfely as pofible. In fhort, the black-lead crucible feems to be the beft material that could poffibly be devifed for thefe purpofes.
"The heat which this little furnace will afford is fo intenfe, and fo much more than would at firft fight be expected from fo trifling an apparatus, that it was only the accidental fufion of a thick piece of catt iron in it that led us to fufpect its power. The utmoft heat which we have procured in this furnace has been $167^{\circ}$ of a Wedgwood pyrometer piece, which was withdrawn from a very fmall Heffian crucible when actually finking down in a ftate of porcellanous fufion. A fteady heat of $150^{\circ}$ to $155^{\circ}$ may be ufually depended on, if the fire be properly managed and the bellows worked with vigour. This is fufficient for moft operations in chemiltry; and the economy in time and fuel is extreme, fince a furnace of the given dimenfions will very well raile to the above point of heat in from five to ten minutes a Heffian crucible of fuch a diameter, that the average thicknefs of burning fuel around its bottorn is not more than one inch and a half. A fmaller crucible will take a higher heat, but at the rifk of its foftening and falling in by the weight of the incumbent fuel.
"Coak, or common cinders taken from the fire juft when the coal ceafes to blaze, and brcken into very fmall pieces, with the duft fifted away, form the beit fuel for the highelt heat. A light fpongy kind of coak, formed of a mixture of coal and charcoal, called Davey's patent coal, alfo anfwers extremely well. Charcoal alone has not weight enough, when broken fo fmall as it mult be to lie clofe in this little fire-place, to withfland the force of the blaft when very violent. A bit of lighted paper, a handful of the very finall charcoal, called in London fmall coal, and ten or a dozen Atrokes of the bellows, will kindle the fire in almolt as many feconds.
"Various littie alterations and arrangements, which will readily occur to the practical chemilt, will fit this little apparatus for diftillation with an carthen retort, ieating a gun-barrel paffed through the fire, bonding flatis tubes, \&ic.

Vos. 1X. Part I.
" I thall only adil, that the dimentions of this farnace ware determined monly by ti.e circemaltance of having i.t rand picces of blach-leat pets of this fize, fo !! that doedrlat thev mav ! ecurio! sithont ans diminution, and prombly with fome increate of the cflect. I he Gane mas be find of tise numer of holen; for in
 with this daberence, howerer, that, be lowg werting. the melied 1has of the coak nill now and then prattilly block up me or two of the holes; on what acount perhaps the greater number is preierable.*

FURNITURE, a torm in diallins, whirh denoter Ata, . certain addtional points and lines drawn on a dial, by $1 \cdots$ way of ornment, fuch as the figns of the zodiac, length of days, parallels of declination, azimuths, points of the compals, meridians of chicf cities, Babylonic, Jewith, o: Italian hours, \&c.

FUROR UTfRiNus, a diforder peculiar to women. See Medicine Inder.

FURR, or FUR, in Commerce, fignifies the $\mathbb{A}$ in of feveral wild beats, drefled in alum with the hair on; and ufed as a part of drefs, by princes, magiltrates, and others. The kinds moft in ufe are thofe of the ermine, fable, caitor, hare, rabbit, \&c. Ste Musteli.

It was not till the later ages that the furs of beafts became an article of luxury. The more refined nations of ancient times never made ufe of them; thofe alone whom the former ftigmatized as barbarians were clothed in the 1 linins of animals. Strabo defcribes the Indians covered with the thins of lions, panthers, and bears; and Seneca, the Scythians clothed with the ikins of foxes and the leffer quadrupeds. Virgil exhibits a picture of the favage Hyperboreans, fimilar to that which our late circumnavigators can witnefs to in the clothing of the wild Americans, unfeen before by any polithed people.

$$

Mont part of Europe was at this time in fimilar circumflances. Cefar might be as much amazed with the dkith-dreffed heroes of Britain, as our celebrated Cook was at thofe of his new-difcovered regions. What time has done to us, time, under humane conquerors, may effect for them. Civilization may take place; and thofe fooils of animals, which are at prefent effential for clothing, become the mere objects of ornament and luxury.

It does not appear that the Greeks or old Romans ever made ufe of furs. It originated in thofe region where they mot abounded, and where the feverity of the climate required that fyecies of clothing. At firlt it confitted of the $\mathbb{R}$ ins only, almoll in the tate in which they were tom from the body of the beatt ; but as foon as civilization took place, and manufactures were introduced, furs became the lining of the drefs, and often the elegant facing of the robes. It is probable that the northen conquerors introduced the faflion into Europe. We find, that about the year 522 , when Totila king of the Vingoths reigned it Italy, the Suethons (a people of modern swecien? found means, by help of the commerce of numberlef intervening prople, to tranfmit, for the ute of the Romans, faphilings peller, the precious tkins of the foble". As lusury advanced, furs, even of the moth valuablie 01

Furr. ficcies, we:e ufed by princes as linings for their tents: thuw Marco Polo, in 1252, found thote of the Chom of Tatary lined with ermines and fables. He calls th:e lat sibeline's and zambolincs. H: fays that thofe and o her precious furs were brought from countries far nosth; from the lawt of Darkac's, and regions atmol inaccolible by reatho of momen and ite. The Weath fet a bigin value on firs an early as the time of Elowel 1)da, who beran his reign abuit 940 . In the next ace, furs became the fathonable magnificence of Europe. When Godfrey of Boulogne and his followto appeared before the omperor Alexis Comnenus, on their way to the Holy Land, he was llruck with the ri hanefs of their cireffes, tan cx olfo quam aurifrizio et nue ofore harmelino it it mardrino gri/ioque et sario. How different was the advance of luxury in France from the time of theix great monarch Charlemagne, who contented himfelf with the plain fur of the otter ! Our Henry I. wore furs; yet in his diflrefs was whiged to change them for warm Wellh flannel. But in the year 1327 the luxury had got to fuch a head, that Edvard III. enacted, that all pertons who could not fyend a hundred a-year thould abfolutely be prolibited the ufe of this fecies of finery. Thefe, from their great expence, mult have bcen foreign furs, obraned from the Italian commercial ftates, whole traific was at this period boundlefs. How etrange is the revolution in the fur-trade! The north of $A$ fia at that time fupplied us with every valuable kind; at prefent we fend, by means of the poffeftion of Hudion's Bay, furs, to immenfe amount, even to Turkey and the diftant China.
H.Fory of the FUR Trade,-During Captain Cook's laft voyage to the Pacific ocean, befides the various fcientific advantages which were derived from it, a new fource of wealth was laid open to future navigators, by trading for furs of the motl valuable lind on the north-weit coait of America. The firt veffel which engaged in the new branch of trade pointed out by that great navigator, was equipped by fome gentlemen ia China. She was a brig of 60 tons and 20 men, commanded by James Hanna. She failed from the Typa the end of April 1785 ; proceeded to the northward, along the coatt of China; paffed through Dienen's ftraits, the fouth end of Japan; and arrived at Nootka in Auguft following. Soon after her arniva!, the natives, whom Captain Cook had left unacquainted with the effect of fire-arms, tempted probably by the diminutive fize of the vefli 1 (fcarce longer than fome of their own canoes) and the fmall number of her people, attempted to board her in open day; but were repulfed with confiderable latughter. This was the introduction to a firm and lalling friendihip. Captain Hanna cured fuch of the Indians as were wounded; an unreferved confidence took place; they tradel fuirly and peaceably; a valuable cargo of furs was procured; and the bad weather fetting in, he left the coast in the end of Soptember, touched at the Sandwich illands, and arrived at Macao the end of Derember of the fame year.

Cantain Mana faited again from Macao in May 1736 , in the fnow Sea-Otter of 120 tons and 30 men, st.d returned to Macao in February 1787. In this fecond vovare he followed his former track, and arsived at Nootka in Augut; traced the coaft from
thence as far as 33 degree e, and explored the extemive found difcovered a hrort time betore by Mr Sirange, and called by him Gueen Chatlote's found, the hatitude of which is 51 degrees north, longitude 128 weit.

The frow Lark, Captain Peters, of 220 tons and 42 men, failed from Macao in July 1786 . Her delination was Kamtfhatka (for which ihe was protided with a fuitable cargo of arrack, tea, \&c.), Copper illands, and the N. W. coalt. Captain Peters was directed to make his palfage between Japan and Corea, and examine the illands to the north of Japan, faid to be inhabited by hairy people; which, if Captain Cook had lived, would not have been left to the French to determine. No account having been received of this veflel fince her departure, there is every reafon to fear the has perilhed.

In the beginning of 1786 , two coppered veffels were fitted out at Bombay, under the direction of James Strange, Eiq; who was himfelf a principal owner. Thefe veffels were, the fnow Captain Cook of 300 tons, and fnow Experiment of 100 tons. They proceeded iu company from the Malabar coalt to Batavia; paffed through the itraits of Macaflar, where the Experiment was run upon a reef, and was obliged to haul ahmore upon Borneo to repair; from thence they iteered to the eattward of the Palaos illands; made Sulphur illand; and arrived at Nootka the end of June following. From Nootka, where they left their furgeon's mate (Mackay) to learn the language and collect ikins againft their intended return (but who was brought away in the Imperial Eagle the following year), they proceeded along the coatl to Queen Charlotte's found, of which they were the firlt difcoverers; from thence in a direct courle to Prince William's found. After fome itay there, the Experiment proceeded to Macao (their veffels being provided with paffes by the governor-general of Goa): the Captain Cook endcavoured to get to Copper illand, but without fuccefs, being prevented by conftant weft winds.

Two coppered veffels were alfo fitted out by a fociety of gentlemen in Bengal, viz. the fnow Nootka of 200 tons, and the fnow Sea Otter of 100 tons, commanded by John Meares and William 'Jipping, lieutenants in the roval nasy. The Nootka failed i: March 1786 from Bengal; came through the China feas; touched at the Bafhees, where they were very civilly treated by the Spaniards, who have taken polfeffon of thefe illands; arrived at Oonalallaka the beginning of Augult ; found there a Rutfian galliot and fome furriers; difcovered accidentally nea: Cape Greville a new tirait near Cook's river, 15 leagues wide and $3 \circ$ long; faw fome Ruffan hunters in a fmall bay between Cape Elizabeth and Cape Bear ; and arrived in Prince William's found the end of September. They determined wintering in Snus Corner Cove, lat. 60. 30 . in preference to going to the Sandwich ithands, which feem placed by Providence for the comfort and refrefminent of the adventurers in this trade, and were frozen up in this gloomy and trightful fpot from the end of November to the end of May. By the feverity of the winter they loft their third and fourth mates, furgeon, boatfwain, carpenter, and cooper, and twelve of the fore-malt-men; and the remainder were fo enfecbled as to be under the neceflity of apply-
rer. in to the commanters of the Kin George and geen Consrimete, who :at at this time arrived in the found, for fome hants to athin in carrying the sellat to the Sondwich innal, where, giving over all futher thow'its of tade. they determined ater getting a fea-fock of the of Cape Edgecumbe) immediately to proceed. The Nootka arrived at Micao the end of 0. tober $1-57$.

The Imperial Eagle, Cartain Barkley, fitted out by a foricty of gentiemen at Olend, fited from Oitend the latter end of November 1786; went into the bay of All Saints; from thence, withont toaching any where, to the Sandwich illands, and arrived at Nootka the beginnine of June; from thence to the touth, as far as $47^{\prime} 30^{\prime}$, in which face he difoovered lome good and fpacious harbours. In the lat. of $47^{\circ}+6^{\prime}$, loft his fecond mate, purfer, and two feamen, viho were upon a trading party with the !o.:g-ton, and imprudently truiting themfelves ahore unarmed, werc cut off by the natives. This place feems to be the fame that Don Antorio Mourelle calls the I...a d. los D\%!ores, where the Spaniards going athure to water, were allo attecked and cut off.

The King George of 320 , and the Queen Charlette of 200 tons, commandef by Coptains Portock and Dixon, who ferved under Captan Cook in his hait voyage, were fitted out by a iociety of gentlemen in England, who obtained a privilege to trade to the north. welt coaft of America, from the South Sea and Eait India companies.

Thefe veliels failed from England the beginning of Septemiver 1785 ; toached at the Faikland illands, Sand wich ilands, and arrived at Couh's river in the monh of Auquit. From thence, after collecting 3. few furs, they theered in the end of September for Pance William's found, intending, it is fad, to winter there; but were prevented entering, by heavy forms and eatreme bad weather, which obliged them to bear away, and feek fome other part of the ccaft to winter 2.t. The ftorms and bad weather accompanied them :ill they arrived off Nootka found, when they were fo near the hire, that a canoe came ofl to them : but thouth thus near accomplithing their purpofe, a frefh florm canie on, and obliged them finally to bear away is the Sand wich illand, "here they remained the winter months; and returning again to the coatt, arrived in Prince Willian's found the middle of Muy. The King George remained in Prince William's found ; and during her tay, her long-boat difeovered a new paffage from the found into Cook's river. The Queen Charlotte procceled along the coalt to the fouth; looked iato Behring's bay, where the Rufians have row a fettlement; exanined that part of the coaft from $55^{\circ}$ to $52^{\circ}$, which was not feen by Captain Cook, and which comfits of a ctatter of illands, called by Capt.in Dixon 2esecn Charlyte's I/ands, at a confideraile Einance from the main, which is thus removed farther $\therefore$ the ealtward than it was fuppefed to be: fome part of the continent may, however, be fien from the eaft Ghe of thefe inlands; and it is probable the difance does not anywhere exceed 50 lespues. (on thi effimation, Hudfon's H "ue, hat. $53^{\circ}$. Ions. $1066^{\circ} 27^{\prime}$ we th, will not be nore than $\delta=0$ milec dift wit from that part of this coaft in the fame parallel. I is theramer not improbable, that the enterpring finit of our Cama-
dian furriers may penetrate to thi coal (the cummunication with which is probatly much facilitated by lakes or river), and wid to the comtort, and buat ries of Jusope this invaluable fur, whinh in wam 1 , beauty, and magnific ane, fan execels the sicheet fu:, of Sibeia. Oacen (harlotte" inland aro inhalitet by a race of laple difurneg in lankuse, fature, and mannen, from it the ohe triber of this cmen'. Among other peculiantice, they are dillinguithed by a lirge incifon in the under lip , in which is incord a piece of polihed wool, fometimes ornamented with mother of pearl thell, in thape and tize like a waver's thuttle, which undoubtediy is the moft efficetual mode of deforming the humen face divise that the inguione depranty of tafte of any favage mittion hav set dicovered. Thele ihips, after difpoing of their furs in Clina, were loaded with teas on account of the Englih company, failed from Wampoa, and arrived in England, after an atfence of three years.

The year after the departure of the King Gcorgc and Queen Chariotte, the fame fuciety to which thiy belouged fitted out two other vellel, viz. the Princelf Royal of 60 tonc, and the Prince of Wales of 200 tons, commanded by Cyptains Colvet and Dürcan, the former of whom bad ferved under Captain Cook. Thete velicis left Enghand in Augut 1786; touched at Ne:\% Year's larbour on Staten Lend, where they left an oficer and 12 men to kill feals againf the arrival of a velll which was to follow them from England; from thence they procecled dreetly to Nootka , where they arrived the 6th of Ithy, fith and in bad condition, and found hare the Imperial Fagle, which had left Europe fome months after them. Learing Nootla, they flecred along the thore to the north. ward, and foon after fell in with the Queen Charluite.

In the Feginning of $1-83$, Captain Mears failed again with two other vellals, the Folice, which the commanded himielf, and the lphigenia, Captain Duu glas, to Nootka found. Here he purchated of the chief of the dintrict a fput, on which he built a bate for his refidence and more convenkent intercourle with the natives, hoiling the Bitih culouss thereon, furrounding it with a breatt-work. and mounting a three pounder on the front. Having fo done, he fent Mr Doughas in the phizenia to ude thong the morthern ccall, while he himelf procecced to the fouth : and by prefents to the chiefs ohtaind the pats $C i n$ and Effingham, and the promife of an exclunive trace with the natives of the diulict, and who fome other places. which he torls poflelion of in the name of the himg. Captian Douglas likenife, by frecens to the chicfo of the countries be visted, obtaind fimilar privilege. no other Emrogean refel havise biled there before him.

On their teturn to Nou!?, they fromd a welma firin.ed which the commander had hidd down te "ore his ceparture. Thi, which he ramel the Nore: West America, he lit at Nomba with the hhimm, white be faited with a catho of fins in the lectice to China.

A fen duye after his arriva! at Chima, two veffels, the Prince of Wales and Jinceit Kaval, rame to Con tun from their thais.g waye abow inemond. Cop-

 1,as, ander the command of 1) m Martine 2 , anchored in tise wated. Ior a few day notual civilities puled betacen the: \& mian cantoin and NI: Douglas; but at the end of and a we … Don Martinez fummoned the letter a bosid lis own thio the Pincefla, telling him lee tha dis peifoner, and thot the hing of Spain hat commatded him, Dun Itartinez, to feize all velfels he foud find un that coat. Hu therefore inatruted his othices to tane polieftion of the I hisenia, which th $y$ accordingly did in the name of his Catholic nu*elty; and the officers and crow were conveyed :" pribters on board the Spanh ihip, where they whe $\mathrm{p}^{\text {ut }}$ in ironc, and ethernile in treated. Frometilitely after thic, Don Martinez took poldefion of the litte fettiment, hoiftig the tandard of Spain, and modefiy Etclaring all the lands from Cape Horn to $6=$ degrees nortis latitude belunged to his matter. To -gsravate the intult, he forcibly employed the crew of the $I_{P}$ higenia in building batteries, \&c. and ofered no kind of siolence to two American vellels that were at the fame time in the harbour. At this time the North-Weit America was lent to explore the Archipelago of St Lazaras. On her return to Noutha, the met with a fimilar treatment, and the thins the had collected were feized, with the relt of her cargo.

A few days after the Prince's Roval (which we have mentioned as leaving Canton in c, mpany with the -irgonaut) arrived. The Spanith commander, for reafas that do not appear, fuffered her to depart. The thins collected by the North Weit-America were Alipped on board her fur the benefit of her owner, and the proceeded to trade in the neighbouring ilke. On the 3 of July, the Argonant arrived at the found ; and Don Martinez, after mahing every profetion of civility to Mr Colnet the commander, touk polleflion of the faid thip in the nane of his miter, and made prifoners of the crew. Soon after, the Princets Royal returning to receive influctions from Mr Cumet, director of the enterprite, was feized by the Spanith captain.

The cretts of the Bitilh veffels were diferently difpoled of; fome lent to China by the American viliels, and others to Spanith America: but the Chinefe were all detained, and employed in the mines which were upened on the latds purchaled by Captain Mears. What the!c rines conlited of, we are nowhere inEurmed. Mr Culact was fo much atie ted at the fallure if the euterprife, as to be deprived of re:fon.

This, as foon as known, occafoned a fipited repretestation from the britilh cuurt to that oi Spain; at the f.me time that vigorous preparations were made fur war it cafe adegunte 1utisfaction thenth de refufed.

Matter, honcres, recre prevented from comins to extremitics, by a compliance on the part of Spain, atier many delays and much artifice of nequtiation, with the requintions of Brituin : in coniefuence of which, among other advantages umeceflery to be here recied, the whole trade fiom Calionnia to China is completely laid open ; and the Britih alluwed the full excrite of navigation and commetce in thole parts of the word which were the fubject of difution.

In fome accounts of the royages abowe mentioned. the fur trade in thole parts has been greatly magnified. In that publihed by Captain Portluck, however, this officer obferves, that the gains hitherto have certainly not been enviab'y great; though the menchan.ts have no doubt found the trade lucrative.
 ath-The fulluniag account of this train in extumed from Mr Nuchenzic`s Narrative of his Vosaces usht Travels from Montreal, through the Nurth-went Cuntinent of America, and to the Paciric ocesn.
" The fur trade, he fiys, from the earliett fettlentent of Canada, was confidered of the frit importance to that colony. The country was then io porulous, that, in the viciaty of the eftablihments, the animals whole tkins were precious, in a commercial view, foon became very farce, if not altogether extinct. They were, it is true, hunted at former periods, but merely for food and clothing. The Indians, therefore, to procure ti:e neceflary fupply, were encouraged to penctrate into the country, and were generally accompanied by fome of the Canadians, who found means to induce the remotelt tribes of natives to bring the fkins which were molt int demand, to their fettlements, in the way of trade.
" It is not necellary for me to examine the caufe, but experience proves that it requires much lefs time for a civilized people to deviate into the manners and cufloms of favage life, than for favages to rife into a tlate of civilization. Such was the event with thofe who thus accompanied the natives on their bunting and trading excurfions; for they became fo attached to the Indian mode of life, that they loit all reliih for their former habits and native homes. Hence they derived the title of Courcurs des Buis, became a kind of pedlars, and were extremely ufeful to the merchants engaged in the fur trade; who gave them the neceflary credit to proceed on their commercial undertakings. Three or four of thefe people would join their ftock, put their property into a birch bark canoe, which they worked themfelves, and either accompanied the natives in their excurfions, or went at once to the country where they knew they were to hunt. At length, thefe voyages extended to 12 or 15 months, when they retumed with rich cargoes of furs, and followed by great numbers of the natives. Daring the fhort time requifite to fetthe their accoums with the merchants, and procure frefl credit, they generally contrived to fquander away all their gains, when they returned to their favourite mode of life: their views being anfwered, and their labour fuiliciently rewarded, by indulging themfelves in extravagance and difipation during the fhort fpace of one month in 12 cr 15.
"The indifference about amafing property, and the pleafure of living free from all reltraint, foon brought on a licentioufnefs of manners which could not long efoape the vigilant obfervation of the mintonarics, who

 the erent a ixect in which tiole pions on th had dewoted th. ir lans. Thes, therevore, exeried their inAlaenoe to pocare the fuppremon of the fe peophe, and areadi. iv, no one was allowed to go ne the country to : whice with the Indins, without a licence from the guveramen:
" At length, military pofts were ellabilihed at the contunce of the diferent large haves of Canada, which, in a areat meafure, checlied evil conferquences thes Followed from the improper conduct of thete foredters. and, at the fame time, protected the trade. BeEide, ? number of able and refpectable men retirel fron the amy. prolecuted the trade in perion, twaler the:r secen licences, with great on wer and resulacity. a: $d$ ex:onded it to fuch a diftance, as, it thoie days, $\cdots$ cens 'tred to be an altonithing effort of commexcia! enturyize. Thefe perfons and the miftonares havir: combined theit views at the fame time, fecured the refoct of the natives, and the usedrance of the people receneril emploved in the hborions part, of this intertaking. thaie gentlemen denominated them. fetves commanders, ard not traders, though they were intilied to theth thofe characters: and, as for the mitfionaries. if fuferings and hardihip, in the profecution of the oreat wht whic'r they had unde taker, delowed applatie and atmitation, they had an ancouth d claim to be almired and ap, laudel: they foret ro latur ad avoided no danger in the execution of their in ;ort , nt office; and it is to be ieriouty lamented, that their ious endeavours did noi meet with the fuccefowhich the delerned: for there is hard'y a trace to he found, beyund the cultivated paris, of their meritorious iunctions.
" This caule of the failure muit be atributed to a want of due conideration in the mode mployed by the milfionaries to propagate the religion of which they were the zealous miniters. I hey habituated themfelves to the favase life, and naturalied themielves to the favage manners, and, by thus becoming dependant, as it were, on the natives, they acquired $\mathrm{t}^{\mathrm{l}}$-ir contempt rather than their vencration. If they had been as uell acquainted with human nature, as they were with the articles of their faith, they would have known, that the uncultivated mind of an Indian mult be dilpoled by much preparatory method and inllru-tion to receive the revealed truths of Chrillianity, to act under its fanctions, and be impelled to good by the hope if it resards, or tumed from evil by the fear of its purillments. They inould have legun their work by teaching fome of thoe ufeful arts which are the inlets of knowledge, and lead the mind by degices to object of higher comprehenfion. Agriculture io frmed to fix and combine fociety, and fo preparatory to objects of fuperior contideration, ihould have been the firlt thing introdaced among a favage people: it attaches the wandering tribe io that fuot where it adds fo much to their comforts; white it gives them a fenfe of property, and of latting puftemion, in. ftead of the uncertain hopes of the chafe, and the fugitive produce of uncultivated wilds. Such were the sacans by which the forefts of Paragus were converted

Tori. waked to a fa:age life, accomanied them thither a:nrually, till mercatnile aswoturers again appeared from their own cuater, aricr an intersal of feveral years, owing, I happore, to an ipnorance of the cuantry in the conquenors, and their want of commercin! conidence in the conquered. 'Hhere weme, inded, other difouragements, fuch as the inmmenfe length of the jouracy necelin, $\begin{gathered}\text { g to reach the limits beyond which this }\end{gathered}$ commerce mutt begin; the ritk of property; the expences attending fuch a long trampons; and ais ignorance of the language of thofe wlo, from their esperience, mutt be neceभtily employed as the intermediate afons letwen them and the natives. But, notwihhanding theie difficulties, the trade, by degrees, began to fipered over different parts to which it had been carried by the French, though at a great rifk of the lives, as well as the property, of their new pefleffors, for the natives had been tauk by their fomer allies to entertain bolitie difpolitions towards the Englifl, from their having been in alliance with their natural enemies the Iroquofic and there were not wanting a futticient number of difcontented, diappointed penple to keep alive fuch a nution ; fo that for a long time they were conndered and treated as objects of hotlility. To prove -his difnofition of the Indians, we have only to refer to the condust of Pontiac, at Detroit, and the furprife and taking of Wichilimakimac, about this period.
"Hence it arofe, that it was fo late as the year 1-65, before which the trade I mean to condider - mmenced from Michilimakinac. The firtt who atiempted it were fatisfied to go the length of the river Camenitiquia, about $3 \circ$ miles to the eaftward of the Grande Portage, where the French had a principal elabliflunent, and was the line of their communication with the interior country. It was once deftroyed by fise. Here they went, and returned fuccefsful in the following fring to Michilimakinac. Their fucvels induced them to renew their journey, and incited athers to follow their example. Some of them remained at Camenilizuia, while others proceeded to and beyond the Grande Portace, which fince that time has become the principal entrcpit of that trade, and is fituated in a bay, in latitude 48 . north, and longitude 90. weit. Ifter pating the uftal feafon there, they went back to SIichilimakinac as before, and encouraged by the trade, setumed in increafed numbers. One of thefe, Thomas Curry, with a firit of enterprife fupericr to that of his contemporarics, determined to penetrate to the furthell limits of the French dicoseries in that country ; or at leaft till the froft thould itop him. For this purpofe he procured guides and interpreters, who were acquainted with the country, and with four canoes arrived at Fort Bourbon, which was one of their pofts, at the wett end of the Codar lake, on the waters of the Safkatchimine. His rikk and toil were well recompenfed, for he came back the following fpring with his canoes flled with fise furs, with which he proccelel to Canada, and was latisfied never agsin to return to the Indian country.
"Firom this period penple becan to fpread over every - Gen. $V^{\prime}$. Purt of the country, particularly where the French had ofth: $\Gamma$, Chlab, bilied fettlements."*
IVane 1. After continuing the detail of the hifory of the trade fn whith we mult refer to the work iticlf, Mr Mace kenzie proceds to inform us of the concern which he
himfelf had in it, when is the year $1 y^{8} 5$, he was affumed as a partner, on condition of going into the $I_{1}$ ditn country to take an active thare in the bulinets. After fome firuggles, from jealoufy and rivalhip, with ant ther company who had been fome time in the trade, a union between the two companies was formed. This happered in 1787, and the following is Mr Mackenzie's account of its fucceif, and of the extent and mode of conducting this trade.
" This commercial eflablidument, " he proceed,"" was now founded on a more folid batis than any hitherto known in the country; and it not only continued in full force, vigour, and profperity, in fpite of all interference from Canadn, but mintained at leaft an equal hare of advantage with the Hudfon's Bay Company, notwith. ftanding the fuperiority of their local fituation. The following account of this felf-erected concern will manifent the caufe of its fucceis.
" It affumed the title of the North-Wen Company, and was no more than an affociation of commercial men, agreeing among themfelves to carry on the fur trade, uncornected with any other buninefs, though many of the parties engaged had extenfive cuncerns altogether foreign to it. It may be faid to have been fupported entirely upon credit; for, whether the capital belonged to the proprietor, or was borrowed, it equally bore intereft, for which the affociation was annually accountable. It confifted of twenty thares, unequally divided among the perfons concerned. Of thefe, a certain proportion was held by the pecple who managed the buiinefs in Canada, and were flyled agents for the Company. Their duty was to import the neceflary goods from England, itore them at their own expence at Montreal, get them made up into the articles luited to the trade, pack and forward them, and fupply the cait that might be wanting for the outfits; for which they received, independent of the profit on their thares, a commifion on the amount of the accounts, which they were obliged to make out anmully, and keep the adventure of each year difinct. Two of them went anmally to the Grande Portase, to manage and tranfact the bufinefs there, and on the communic.tion at Detroit, Michilimakinac, St Mary's, and Muntreal, where they receired thores, packed up, and hipped the company's furs for Lingland, on which they had alfo a fmall commition. The remaining thares ware held by the proprietors, who were obliged to winter and manage the buinels of the concern with the Indians, and their refpective clerks, \&c. They were not fuppofed to be under any obligation to furnih capital, or cren credit. If they obtained any capital by the trade, it was to remain in the hands of the agents; for which they were allowed intere'z. Som of them, from their long fervices and inhuence, held double thares, and were allowed to retire from the budinels at any period of the exiling concern, with one of thole flares, naming any yong man in the compans fervice to ficeced him in the other. Seniority a in mit wore, however, conidered an :ffording a clim to the fursellion, which, neverthelefs, could not be difpoled of withont the coneurrene of the miserity of the concern; whe, at the fam- time relinsed the fecoding perfon from any relpondibility refoceting the thare that he transerem! an-1 secomte? for it according to the amual value or wate of the preperty; fo that the Celler could have mo atvoming but that of getting

## $\mathrm{E} U \mathrm{R} \quad\left[\begin{array}{ll}\mathrm{JII}\end{array}\right] \quad \mathrm{F} \mathrm{U} \mathrm{R}$

the thare of nteck which he retained realifed, and receiving for the transterred dhare what was fairly determined to be the worth of it. 'lhe former was alfo difcharged from all duty, and tecame a cormant partner. Thus, all the young men who were not provided for at the beginning of the contrast, fucceeded in fucceffion to the character and advantages of partners. They enter. ed into the company's fervice for five or leven years, under fuch expectations, and their reafonable profpects were foldom difappointed : there were, indeed, inftances when they fuccecded to thares, before their apprenticethip was expired, and it frequently happened that they were provided for while they were in a flate of articled clerkthip. Shares were transterable only to the concern at large, as no perfon could be admitted as a partner who had not fetved his time to the trade. The dormant partner indeed might difnofe of his interell to any one he chofe, but if the tranaction were not acknowledged by his affociates, the purchafer could only be confidered as his agent or attorney. Every thare had a vote, and two-thirds formed a majority. This regular and equitable mode of providing for the clerks of the comnany, excited a fpirit of emulation in the difcharge of their various duties, and in fact, made every agent a principal, who perceived his ow: profperity to be immediately connected with that of his employers. Indeed, without fuch a fpirit, fuch a trade could not have become fo extended and advantageous, as it has been and now is.
" In 1-88, the grofs amount of the adventure for the year did not eaceed 40,0001 .: but by the exertion, enterprife, and indultry of the proprietors, it was brought in eleven years to triple that amount and upwards; yielding proportionate profits, and furpafling, in thort, any thing known in America.
"Such, therefore, being the profperous fate of the company, it, very naturally, tempted others to interfere with the concern in a manner by no means beneficial to the company, and commonly ruinous to the undertakers.
" In 1799 the concern underwent a new form, the mares were increafed to forty-fix, new parthers being admitted, and others retiring. This period was the termination of the company, which was not renewed by all the parties concerned in it, the majority continuine to act upon the old ftock, and under the old firm ; the cthers beginning a new one; and it now remains to be decided, whether two parties, under the fame regulations and by the fame exertions, though mequal in number, can continue to carry en the butinefs to a fuc-
cefsful infue. The contrary opinion has been beld, which, if verified, will make it the intereft of the parties agdin to coalcice ; for neither is deficieat in capital to fupport their olftinacy in a lofing trade, as it is not to be fuppofed t a wher will yield on any other terms than perpetual participution.
"It will not be fuperthous in this place, to explain the general mode of carrying on the fur trade.
" The agents are obliced to order the necellary goods from England in the month of October, eishiten months before they can leave Montreal ; that ic, they are not thipped from London until the fring fullowing, when they arrive in Canada in the fummer. In the courfe of the following winter they are made up into fuch articles as are required for the lavages; they are then packed into parcels of ninety pounds wight each, but cannot be fent from Nontreal until the May following; fo that they do not get to market until the enfuing winter, when they are exchanged for furs, which come to Montreal the next fall, and from therce are fiipped, chietly to London, where they are not lold or paid for before the fucceeding fpring, or even as late as June; which is forty-two months after the gocls were ordered in Canada; thirty-fix after they had been thipped from England; and twenty-four after they had been forwarded from Montreal ; fo that the merchant, allowing that he has twelve months credit, does not rective a return to pay for thofe goods, and the neceflary expences attending them, which is about equal to the value of the goods themfelves, till two years after they are confidered as calh, which makes this a very heavy bulinels. There is even a fmall proportion of it that requires twelve months longer to bring round the payment, owing to the immente diftance it is carried, and from the dhortnefs of the feafons, which prevent the furs, even after they are collected, from coming out of the country for that period (i).
"The articles necellary for this trade, are coarfe woollen cloths of different kinds; milled blankets of different fizes; arms and ammunition; twit and carrot tobacco; Manchetter goods; linens, and coarie thectings; thread, lines, and twine; common hardware; cutlery and ironmonsery of feveral deferiftions; kettles of brafs and copper, and nlicet-iron; filk and cutton handkerchiefs; hats, thoes, and hofe ; calicoes and printed cottons, \& c. \&ic. \&ic. Spirituous liquors and provifions are purchaled in Canada. Thefe, and the expence of tranfport to and from the lndia: country, including wages to clerks, interpreters, guides, and cz-noe-men, with the expence of making up the goods for

T：rr
$\qquad$ tic maket，form about half the anntal amaunt againit tioc adventwre．
＂This expenditure in Canada ultimascly tends to the cocouragement of Pritiln mannfactory，for thele who somployed in the different branches of this wion fo， are unthed by the ir gans to purchate fach Britict ati－ Cis an they mith wherwile forc＊o．
＂The fredace of the year of which I an now feak－ ing，confifed of the following furs and persics：
$1=6,0=0$ Beaver fkine，
6．es Lyns fkins，
z100 Pear tkins，
$15=5$ Fos Rin，
$4=00$ Kitt fox kins，
foここ Otter Aim，
17，oco MIukquath 1．ins，
32，020 Marten 1lins，
isoo Mink fuine，
6：0 Wolverine ikins，
1650 Filler fkins，
1 20 Rackoon Rinis，
$3^{800}$ Wolf isins，
700 Elk Rkins，
750 Deer fkins，
$5=$ Buffalo robes，and a quantio of catloreum，
＂Of thefe ware diverted from the Britih market， being int through the United States to China，${ }^{13}, 364$ Hisis，fine beaver，weighing 19,283 pounds； 1250 fine otter，ard $17^{24}$ hitt foxes．They would have found theit way to the China market at any rate，but this de－ viation from the Britifh channel arofe from the follow－ ing circumfance ：
＂．In adventure of this kind was undertaken by a re－ fpectable houfe in London，half concerned with the Noth－Weft Company in the year 1792．The furs were of the beft hind，and fuitable to the market；and the adventurers continued this comesion for five fuc－ celfive vears，to the annual amount of 40,0001 ．At the winding up of the concern of $1792,1793,1794$ ， 1795，in the ycar 1797，（the adventure of 1796 not being included，as the furs were not fent to China，but difpoled of in London），the North－Weit Company ex－ perienced a lofs of upwards of 40,0001 ．（their half，） which was principally owing to the difficulty of getting home the produce procured in return for the furs from China，in the Eaft India Company＇s hips，together with the duty payable，and the various reftrictions of that company．Whereas，from America there are no impediments；they get immediately to market，and the produce of them is brought back，and perhaps fold in the courle of twelse months．From fuch advantages the furs of Canada will no doubt find their way to Chi－ na by America，which would not be the cale if Britifh lubjects had the lame privileges that are allowed to fo－ reizners，as London would then be found the beit and fafeit market．
＂But to return to our principal fubject．－We fhall now proceed to confider the number of men employed in the concern： 16.50 clerks， 71 interpreters and clerks， 1120 canve men，and 35 guides．Of thefe，five clerks， 18 guides，and 350 canoe men，were employed for the fummer feafon in going from Montreal to the Grande Portage，in canoes，part of whom proceeded from thence to Rainy Lake，as will be horeafter ex－ plained，and are called porkeaters，or gecrs and comers． Thefe vere hired in Canada or Montreal，and were ablent from tiee 1 ft of May till the latter end of Sep－ tember．For this trip the guides had from $8=0$ to 1000 livee，athd a fuitable equipment ；the foreman and terelhic：from $4=0$ to $G=2$ lises；the midule men from

250 to 350 livres，with an equipment of one blanket， one flirt，and one pair of trowfers；and were maintain－ ed during that period at the expence of their employ－ ers．Indeperdent of their wages，they were allowed io traffic，and many of them earned to the amount of their wages．Alout one－third of thefe went to winter，and had more that double the above wages，and equipment． All the others were hired by the year，and fome times for three years；and of the clerks many were appren－ tices，who were generally engaged for five or feven years，for which they had only 1001．provifion and clothing．Such of them who could not be provided for as partners，at the expiration of this time，were allowed from 1001．to 3001 ．per amum，with all neceflaries，till provition was made for them．Thofe who acted in the twofold capacity of clerk and interpreter，or were io denominated，had no other expectation than the pay－ ment of wages to the amount from 1000 to 4000 livres per annum，with clothing and provifions．The cuides， who are a very ufeful fet of men，acted alfo in the ad－ ditional capacity of interpreters，and hal a flated quantity of goods，confidered as fufficient for their wants，their wages being from 1000 to 3000 livres． The canoe men are of two defcriptions，foremen and fteerfren，and middlemen．The two firft were allow－ ed annually 1200 ，and the latter 400 ，livres each．The firft clafs had what is called an equipment，confifting of two blankets，two fhirts，two pair of trowfers，two－ handkerchiefs，it pounds of tobacco，and fome trning articles．The latter had 10 pounds of tobacco，and all the other articles：thofe are called north men，or win－ terers；and to the laft clafs of people were attached up－ wards of 700 Indian women and children，victualled at the expence of the company．

The firft clafs of people are hired in Montreal five months before they fet out，and receive their equip－ ments，and one－third of their wages in advance；and an adequate idea of the labour they undergo may be formed from the following account of the country through which they pafs，and their manner of proceed－ ing．
＂The neceffary number of canoes being purchafed， at about 300 livres each，the goods formed into pack－ ages，and the lakes and rivers free of ice，which they ufually are in the beginning of May，they are then dif－ patched from La Chine，eight miles above Montreal， with eight or ten men in each canoe，and their bag－ gage；and 65 packages of goods， 602 weight of bif－ cuit， 200 weight of pork，three buthels of peate，for the men＇s provifion；two oil cloths to cover the goods， a fail，\＆c．an axe，a towing－line，a kettle，and a fponge to bail out the water，with a quantity of gum， bark，and watape，to repair the veflel．An European on feeing one of thefe flender vellels thus laden，heaped up，and funk with her gunwale within dix inches of the water，would think his fate inevitable in fuch a boat， when he reflected on the nature of her voyage；but the Canadians are fo expert that few accidents hap－ pen．＂＊

ILSON: the fate of a body rendesel fuic by fire. Sue Fiumbtry, and Cutaistry Inder.
 and ote of the thee artits + , whom the madele in. sention of printing has been wfually ateriber. The names of the other two were Gutiomberg and S howfer. It leems impolfitle, howevr, to detormine with cistinty, whether Fult had any other menit in the huime: thest that of fupplying Gutembers whth money, whon had teen making fome attempts with carvel blocks at Sirathurgh, before he vilited Mentz. To Schooffer, the ton-ia-luw of Fut, we are indebted for the invertion of punches and matrices, ly means of whinh th is nolle art was afterwards carried to perfe tion. That work which may be regariled as the origin of the true typograplac art, was the " Durandi Kationale D.:ificrum Oticiorum," pablithed in 1459, hy Fut and Schurifer, which was foot folloned by a culpy of ti: bible, both executed in a very natierly mamier.

We are informed that Fuil went to $P_{a}$ ris in $1+02$, in order to difpofe of a part of the lecond catition of his bible, which he was embled to icll coniderably luwer than bibles in manufeript, yet fome reckoned themotives overcharged by him, and fome pretend that he was even acculed of magic, but for the belief of this thacre anpears to be no rational foundation. It feems certia that Fuft was never in Paris atter the year $1+56$; but that he was in that metropulis then, is proved by a note at the end of a copy of Creero's Olies, intimating that the firlt poffellor received it from John Full at Paris, in 1466. It is extremels probable that he died that year of the plague, to which 4 -, 200 of the inhabitants fell a facrifice in the nonths of Augult and S-piember. This opinion is farther corroburated by this circumRance, that the name of sciaffer done was pretfed to the books which were publithed at Mentz atter ti:n: period.

This man has been frequently confoundea wits John Faul, better known by the name of Dr fuctits, a pretender to the att of magic, who wat frit a theologian. then a ftudent of medicme, and lail of all fild limfelf to the devil for 24 years, at the evpiration of which period it feems the devil came to carry off his pu:t hafi, and dafted out the doctor", brain againt the wall about mid-right. This wretched romane his no dout: been insented by the monks, to blachen the reputation of the great luf, whofe art deprived them ot the emoluments aritus from the copying of manderipts.

Fest, in Arclite fure, the theft of a women, or the Firt compreliencid between the bate and the +afita?, called alfo the naked.

FUS1/AN, i: Commerce, a kind of cotton $i$. $\boldsymbol{\text { i. }}$ which feems as it were whated on one ficte.

Right fultians thould be altogether made of cettosivaru, both woof and warp; but a great many are male, the "arp of which: in tlax, or even bemp.

There are fuftians made of feveral kinds, wide, nerrow, fine, coarfe ; with flag or nap, and without it.

 Saisc, Smmatan, Arali, and crea Greck, $G$ is the 1ard letter. The Hotrews cali it दhimet ur gime', q. d. " cencl;" by reaken it refembles the nech of that anial , whe tirc fanse appeliation it bears in the bumai: , Phenician, and the Chidee: in the Syriac it is Ahrom, in Aral:- stom, and in Grech samma.
The , mama (r) of the Grecks isminetly the giwel ( $)$ ) of the Hebrens or Smmaritus. All the di:Fefac betweon the gamma and gimel coufils in thin, an ar one is turned to the right, and the other to - Wh, according to the diferent manners of writing
 An:- is that all the puiss Salmafies has tuiken on SoA.... to ver the the G was detived from the Greck - in, in linf.

 ab wi the Gect thma I , os might caffify be thown hind one puibers :al the chanacters and forms of thin kater with we ment with in the Gicek and Latia Niss. throw thech the letter palled from $\Gamma$ to $G$.

Diumed, Hil) ii. (a, De Lifcra, c.his G a new ketter. Hiv reation in, that it e Romans hat mut introduced it
 Shmon aceted by C. Duilis, on which we everythese find a C in lieu of $\mathbf{G}$. It was Sp . Carvilius who tirt definguidud teween thofe wo leters, and in antel die firme of the $G$; as we are allured by tio. :amive Senarus. The C ferved wery well for G ; it be ing the dindlut of the Latin alplabet, as the $r$ or \% was of the Grick.
 $V_{a}$ /han, Nam. Impuat, th his. i. p. 39.
M. Beser produce a medal of the Fomilia Opunia, where Gas is read initead of Car, which is a tho feof MI. Iatin. But the $C$ is more frequently fien on medals in licu of $G$; :", Anctatios Ciabiell Cartarimensis, \&ic. fur Aubutanis, \&ic. Not that the pronuriation of thofe words was altered, but only thet the G was unartenly or tegligently chi by
the workmen: as is the cafe in divers inicriptions of c . the caltern cmpiee; where avc, Aucc, Auccc, are frequently found for ace, \&c.

The northern people frequently change the G into $V$ or W: an in Gichus, Wallus; Gallia, Waltio, Vallia, \&e. Tor in this mimance it mut not be liad that the Fench have changed the W into G; becaufe they wrote Gallus long before IFallas or If allia was knows, as appeas from all the ancient Roman and Greels writes. And yet it is cqually taue, that the French change the W of the northen nation, and V confonont, into G; as, Willichnur, "Willian,", into Giuillauma ; II ulphilas into Gulphilas; Iajcon inio Gaforn, \&c.

The letter G is of the mate l.ind, and cannot be ary why founded witheut the help of a vowel. It is foimed by the retlection of the air againt the palate, made by the tongue as the air paffes out of the throat; which Hantianus Capella exprotes thus, G Jpiritus cuna palias: fo that $G$ is a palatal letter.
the modern $G$ tahes its form from that of the Latin:. In Eugith it has two founds, one from the Gicel $r$ and the latin, which is called that of the hard $G$, becaufe it is formed by a prefliure fomewhat hard on the fore part of the tongue againt the upper gam; which found it retains betore $a, o, u, l, r$; as gate, go, guit. At the end of a word it is alway, hasi, as sins, fing, \&c. The othier found, called that of the foft $G$, refembles that of $j$; and is commonly, though liot alvays, found betore $t$ and $i$, as in asfurt, giant, esc. To this rule, however, there are many exceptions; $G$ is often hard before $i$, as give, Eic. and fonctimes before $c$, as $g_{c} t$. Eic. It is alio hard in derivatives fiom words ending
 the ends of worl, as finger. G is mute before $n$, an 5nal?, fi, $n . G / 2$ has the found of the hard $G$ in the Leginuing of a wond, as gitufly; in the middle, anel fome imes at the end, it is quite filent, is reight, though. At the ond of a word $G / /$ has olten the found of $f$, as laugh, rough, tough.

A a numeral, G was anciently ufed to denote 400 ; and with a dath over it thus $\bar{C}, 40,0<0$.

A at abbreviature, G. ftand for Gaius, Gilliur,

GABIRDINE, from the Italian savordina, las been fometimes ulded to denote a courte trock, or menn hies. In this fente it is weal by shakepeare in his 'ïtmpeft and Merchant of Venice, and by Butler in his Hudibres, iouski.
G.ABARA, or Gabbara, in antiquity, the dead buties wlicit the Egyptians embalined, and kept in :heir houfes, efpecially thofe of fuch of their friends as uied with the reputation of great piety and bolinefs, or as martyrs. See Embaming, and Numay.

GABEL (Gabclla, Gablum, Gablagiumi), in French Gabelí, i. e. Vatigal, hath the fame fignification among the ancient Englith writers that gabelle hath in France. It is a tax ; but hath been varioully ufed, as for a rent, cuitom, fervice, \&c. And where it was a payment of sent, thofe who paid it were termed gaiuatorer. When the sord gabel was formerly mentioned without any adcition to it, it iignifed the tax on falt, though afterwards it was applied to all other tases.

In the French cuftoms, the gabel, or tax on fait, computed to make one-fourth of the whole revenue of the kingdom, is taid to have had it rife in France in 1285, under Philip the Fair. Philip the Long took aducle per livre on filt, by an ediat in 1318 , which he promifed to remit when he was delivered from his cnemies; which was renewed by Philin, de Valois ia 1,345 , and the duy was raifed to four denics per lure ; King John refumed it in 1355 , and it was granted to the dasphin in 535 s, to ranfor King John. It Was contizued by Charles V. in 1366 ; after his deceafe it was tupprefied, but revived again by Chatics VI. in 1391 . Louis XI. raifed it to 12 deniers per :ivre; and Francis I. in 1542 to 24 liveres per muid: and it has been confiderably argmented fince that time; So that a minot of Calt latterly paid a duty of 52 lives 3 fols and 6 deniers. Phrlip de Vaboin tirit ellablibhed granarics and oficers of the gabelle, and pruhibited any other perfons from felling falt: from which time the whole commerce of falt for the inland confumpCon contimed wholly in the king's hande, every grain :hereot being fold and diltrituted by his farners and aficers created for the purpule. - This onpre live tax bas lately been abolithed by the Numad Affembly.
G.AD1t, in Ancient (ieveraphy, a town of Latium, midway almate between $k$, mice and lronetie to the calt, often mentioned in the hilory of Tarquin the Prowh.
